A CYCLOPEDIA OF EDUCATION

POLYTECHNICS, LONDON—A name given to a number of institutions in London providing scientific and industrial education and social and recreational opportunities for those engaged in or preparing for the lower branches of industrial and commercial pursuits. The name is perhaps accidental and was adopted in imitation of the institution established by Queen's Hogg & Co. in Regent St., when in 1881 he took over the polytechnic, a place for popular and remunerative entertainment, for his Working Men's Institute. The original plan of the Polytechnic was to provide opportunities for upward and mechanical training for artisans and developed largely under the Science and Art Department. To this movement was soon added the plan, first put forward by Sir W. Henson & Co. in *All Souls and Conditions of Man* (1882), for providing centers for social intercourse and recreation for men and women of the lower middle classes. Sir Walter Henson's scheme took shape at the People's Palace, later the East London Technical College, and now the East London College, a school of the University of London (q.v.). The growth and success of the polytechnic institution was fortunately assisted by the City Parochial Charities act (1885), an act which released the accumulated charitable funds of most of the London parishes to be devoted to the provision of such services for libraries, polytechnics, the Working Men's College, and other purposes. A central governing board was established under this act to supervise the polytechnics. Private contributions and donations of several city companies, e.g. of the Drapers' Co. to the People's Palace, of the Goldsmiths' Co. to the New Street Polytechnic, the Clothmakers' Co. to the Northern Polytechnic at Islington, assisted the establishment of a number of institutes. Further funds were added under the Local Taxation (Customs and Excise) act of 1890, which placed most of the disposal of the London County Council for technical education. In 1891 the London Polytechnic Council was established in place of the Central Governing Board to have general supervision over the educational and administrative work of the polytechnics. In 1901 this Council was dissolved, and the polytechnics came under the control of the London County Council.

After the act of 1883 schemes were drawn up to govern the work of the polytechnics

Their chief educational purpose was to give instruction in arts and science as applied to handicrafts, trades, and business, and to supplement theoretically the practical work of the workshops; to provide public lectures, libraries, and museums, and to afford opportunities for social and physical recreation. Pupils between sixteen and twenty-five were to be admitted, and small fees could be charged. The institutes limited the entrance at first to those students only who were sufficiently prepared to profit by the courses. On the social side many of the polytechnics early provided gymnasiums, playing fields, excursions, club-rooms, and numerous societies sprang up. Educationally there was also a wide expansion, and at present the instruction ranges from continuation work along technical lines for boys and girls from the elementary schools up to undergraduate and postgraduate university work. The following types of schools are provided: (1) day schools for boys and girls, either secondary schools of a modern type, or technical continuation schools giving two or three years' work; (2) domestic economy for girls in small classes, lasting from six to twelve months; (3) trade classes; (4) general courses in science, language, etc., for pupils engaged during the day in wage-earning occupations; (5) day technical schools, schools of arts and crafts, commerce, engineering, architecture, etc.; (6) university work, many teachers in these departments ranking as teachers in the University of London and the students being admitted to the examinations for degrees. Many of the polytechnics are intimately associated with several industries in and around London and give instruction to apprentices and foremen engaged in them. (See APPRENTICESHIP AND EDUCATION.) Various other activities in the field of education are arranged by different polytechnics according to local demands. The polytechnics now receive grants from the Board of Education, under the City Parochial Charities act, and from the London County Council towards salaries, buildings, etc., and from some London companies and guilds. The polytechnics are enabled to teach almost 50,000 students each year. There are now eleven polytechnics in London, as follows: Battersea Polytechnic; Birkbeck College; Borough Road Polytechnic; City of London College; East London College; Northampton Institute; Northern Polytech-

POMNEY

nic; Regent St. Polytechnic; Southwestern Polytechnic; Woolwich Polytechnic; Sir John Cass's Institute.

In the United States the term is occasionally used for technical or semitechnical schools of a secondary grade that are quasi-public in character. For these, see INDUSTRIAL EDUCATION.

POMONA COLLEGE, CLAREMONT, CAL. — Founded by the Congregationalists of Southern California and opened in the fall of 1888. The growth of the college in view of its origin and almost complete dependence for many years upon the benefactions of men of moderate means in a pioneer section has been notable. The productive funds now total \$540,000, the buildings aggregate a value of \$221,300, the equipment \$67,730, and the total assets approximately \$950,000. The buildings are nine in number. The campus, athletic field, and Blanchard Park, composing grounds of 100 acres extent, are situated at the foot of Mt. San Antonio. The museum is equipped especially for work in biological science, possessing 250,000 zoological specimens and an herbarium of 200,000 sheets of plants. Three scientific journals are published in the interests, respectively, of economic botany, ornithology, and astronomy. The college is coeducational and non-sectarian. Its enrollment in 1911 was 381 students in the four undergraduate classes. Affiliated schools of music and of art and design are conducted; the preparatory school has been discontinued. The faculty numbers 38, the alumni 130.

POOLE, JOSHUA (fl. 1640). — An English schoolmaster, subsizar of Chiro Hall, Cambridge, where he graduated M.A. From the *English Parnassus* it appears that he kept a private school in the house of Francis At-

POOR LAW AND EDUCATION

kinson at Hadley, near Warrington, Middlesex. Poole was the author of *The English Accidence or a Short and Easy Way for the same*, *Syllaby Attaining to the Latin Tongue* (1640), and of the *English Parnassus or a Help to English Poets*, containing a Collection of all the Rhythming Minstrells, the Choicest Epigrams and Phrases with some General Fancies upon all Occasions, Subjects, Themes, Alphabetically digested, printed posthumously in 1672. The preface contains a short Introduction of English Poetry, signed J. P., in which another work, the *English Accidence*, is mentioned, but does not appear to have been published. A list of "The Books principally made use of in the compiling of this work" (the *Parnassus*) is given and shows a wide acquaintance with English poetry. An "Alphabet" of Miscellaneous 'prodes the main part of the work, which is divided into two sections, alphabetically arranged, giving a list of poets and of phrases and quotations appropriate to the various terms.

POOLE, WILLIAM FREDERICK (1821-1894). American librarian, was graduated from Yale College in 1841. While a student in college he was librarian of the "Brooklyn in Unity," and began the annual *Index of Periodical Literature* (the first edition published in 1848), by which he is well known. He was assistant librarian at the Boston Athenaeum in 1851, librarian of the Mercantile Library of Boston from 1852 to 1856; librarian of the Boston Athenaeum from 1856 to 1860, he organized the libraries at Waterbury, Conn., St. Johnsbury, Vt., and Newton, Mass.; also the library of the United States Naval Academy at Annapolis and the Newberry Library at Chicago. He was one of the founders of the American Library Association (1877), and for several years its president. His publications include the *History of the Dictionary* (1857), a number of works on American history, and many papers on library science.

POOR LAW AND EDUCATION. The large amount of child pauperism in England and Wales has kept Poor Law Guardians constantly aware of educational problems. Though the number of children in receipt of relief has considerably fallen since 1870, when they numbered 400,000, the total still keeps somewhere in the neighborhood of a quarter of a million and constitutes from 25 to 30 per cent of the whole volume of pauperism. After 1871, however, there was a great "tightening up" of administration with regard to outdoor relief, and the subsequent decrease has related wholly to that class. The children receiving indoor relief have considerably increased. The latest figures, given in the last report of

the local government boards are those for Jan 1 1911. There were then 24111 children under sixteen years of age who were in receipt of relief. The 1911 Census and Inquiry into the Education of Children of certain ages since the age within the limits of the compulsory and optional ages. The education of these children, as not solely the responsibility of poor law authorities, has made no special direct responsibility of the local authorities in the compulsory age.

Authorities dealing with Poor Law Education. The voluntary institutions are numerous and are responsible for the Home Office, which has charge of industrial and technical schools. These are the only ones which are not under the control of the local authorities. The Poor Law Board and the Local Government Board are responsible for the compulsory and optional ages. The Home Office is responsible for the compulsory and optional ages. The Poor Law Board and the Local Government Board are responsible for the compulsory and optional ages.

The Poor Law Board and the Local Government Board are responsible for the compulsory and optional ages. The Home Office is responsible for the compulsory and optional ages. The Poor Law Board and the Local Government Board are responsible for the compulsory and optional ages. The Home Office is responsible for the compulsory and optional ages. The Poor Law Board and the Local Government Board are responsible for the compulsory and optional ages.

The Board of Education is the central authority for public elementary, secondary, and technical education, and has already been paid inspectors poor law and certified schools with regard to the teaching given therein, though nothing else. This arrangement was not adopted until 1904. Since 1862 special poor law inspectors of education had been employed by the Local Government Board. Before 1862 poor law schools had been inspected by officers of the Education Committee of the Privy Council, then the central authority for education, which had given grants to these poor law institutions. When the work was handed over to the Board of Education in 1881, the list of schools inspected was far from being a complete one, and the inspection of certified institutions not receiving grants from the Board is still incomplete. Some few certified schools, however, governed by voluntary associations and receiving poor law and other children, had even before 1881 placed themselves under the supervision of the Board as public elementary schools in order to receive grants from the national exchequer.

The complexity of the system and the dual authority of education and poor law authorities may be further cleared up by noting the local public authorities responsible for the adminis-

tration of these various institutions. These are:

1. The education committee of county and certain borough and urban district councils which establish and administer all the various classes of schools coming under the heading of voluntary schools, public elementary schools including infant schools, physically and mentally defective schools, and public secondary, trade, and technical schools.

2. Boards of Guardians of Parishes and Unions of Parishes, Joint Boards, and the Metropolitan Asylums Board (made up of poor law and municipal representatives) which look after all poor law schools and homes and other institutions for children. It may be noted also that the Metropolitan Asylums Board has under its charge some residential homes for defective children.

3. Voluntary associations, mostly in connection with religious bodies - which govern industrial and certified schools and homes for various classes of children, including those in receipt of poor law relief.

It is therefore obvious that the education of each indoor child depends already to a large extent in the hands of other authorities. The Home Office has supervision of a handful of poor law children in its industrial schools type, and the education authorities are responsible for the majority of the remainder. The children of school age are under relief, whether living in their own homes or boarded out, attend the public elementary schools, and so also do many an indoor child, who live in workhouse or other institutions established by the Guardians or certified by the Local Government Board. Thus in 1910, out of 45,482 children between the ages of three and fourteen in poor law establishments, 21,768 were in attendance at public elementary schools.

The work of the two authorities is therefore very closely connected, especially since the Board of Education has taken over the duty of inspecting even those poor law schools for which the Guardians are directly responsible.

Poor Law Administration. This is bound up in the long and varied experience of Outdoor and Indoor Relief, which forms so large a part of English economic history, but which cannot even be summarized here. (See reference list.)

Types of Institutions. At the present time, therefore, the children for whom the Guardians admit full responsibility are dealt with in the following ways (L. G. B. *Report*, 1909-1910, pp. xxi-xxii. Fig. Jan., 1910):

* Poor law authorities regard the school age as extending from three to fourteen years. The education authorities make school attendance before five voluntary only, and are not bound to provide school places for children below five years of age.

Boarding Out—The boarding-out system has much to recommend it and at its best is a successful effort to give to a destitute child the friendly surroundings of a home. Under the various orders issued from time to time by the Local Government Board it is now permissible for children to be placed by the Guardians with foster parents both within and without the union to which they belong. Conditions have been laid down to secure that the foster parents can provide sufficient house-room, are of good character, and not so poor as to be under any temptation to deprive the children of proper provision. They must not have many children of their own and they must submit to supervision by both local committees and the women inspectors of the Local Government Board. Regulations are less strict for those "boarded out within," and this probably accounts for the greater number and less satisfactory condition of these children. The payment recognized by the Local Government Board is from 4s to 5s. a week,—a noticeably high amount when compared with the sums paid for children living with their own parents. The education of these children is intrusted to the public elementary school, where they mix freely with others of their own age. The Guardians usually select homes in healthy country surroundings,—boarding out in London and large urban centers being forbidden,—and on the whole the scheme has worked very well, though the number of suitable homes and suitable children is necessarily small and the system is not capable of great expansion.

It has, however, one great difficulty. The children finish school at fourteen and the Guardians have to find some immediate footing for them so that they may support themselves. The girls are almost invariably sent

POOR LAW AND EDUCATION

to service, and the boys very frequently become farm laborers. The great object is to get them to work for some one who will train them, and undoubtedly the children of exceptional ability, well-defined tastes, or marked backwardness are at a great disadvantage.

(For boarding out and its difficulties see *Report by Miss Mason in Report of L. G. B., 1898-1910, Pt. I, p. 97, et seq.*)

Institutions under the Control of the Guardians—When dealing with children in establishments under the control of the Guardians it is difficult to make use of the only classification furnished by the L. G. B. scattered homes, for example, have little that is akin to cottage homes, and receiving homes, especially with regard to teachers, are often scarcely to be distinguished from receiving wards in the workhouse itself. But the number of children in each class of institution is unfortunately not available, and they must be dealt with in this rather confused classification.

Children in Workhouses and Infirmaries and M. A. H. Homes—Almost three in four thousand of these are infants under three years of age, and many others are convalescent or ill. Only 384 are born in workhouse schools, and these are in fourteen unions. The greatest number in any one school is ninety-two, and thirty may be taken as the average. The evidence of all investigators goes to show that such schools are badly arranged, ill-equipped and poorly and insufficiently staffed. Whether the appointment goes to a good-tempered young lady who lives outside the workhouse or to an official within, the results are equally poor and the teaching equally unsatisfying and depressing. The curriculum is commonly restricted to the three R's, and the poor teacher has to deal at the one time with a class of children of all ages, sizes, and stages of knowledge. Worse still, the children in such circumstances live their whole time in the workhouse precincts, seeing no other than workhouse children.

Whether education is provided for on the premises or whether, as in the majority of cases, the children go out to the public elementary schools, the workhouse still has them for the greater part of every week day, for every Saturday and Sunday, and for holidays. Holidays, indeed, are rather frequent, for newcomers are continually bringing infectious diseases to the children's wards and long periods of quarantine find them all in dismal illness under the care of that favorite child-murder of the workhouse, the old pastor of good character. Industrial training of some sort is usually given for the most part in cobbling and tailoring, washing and sewing, and the industrial trainer often acts as caretaker in leisure hours. Efforts may be made to keep the children apart from the adults, but they are always doomed to fail. The worn-out old people, the wrecks of middle and early life

¹ No further information is given as to these children.

² 8008 of these children are in certified institutions.

are there, and the children cannot be kept from contact with them. Often the old men keep their own rooms and the girls sleep in public wards, or the men may be getting at the same task. The girls and boys have now time in the nursery with the doctor, the old pauper granter, who tend them, and the mothers of all classes and characters who nurture them. Nothing is clearer here, all considered than the need of taking care to get out of the general mixed workhouse, but the child is still there.

The children in work wards of workhouses, as well as those in the Metropolitan Asylums Board houses for consumptives are of course in a different position. Here regular education of the ordinary type is impossible, though in these institutions a few regular and disciplined regular scholars are carried on. It is, however, a great pity that, when educational authorities are experimenting in open air schools, the poor law authorities do not get them to develop the same system for children in residential homes. Many of whom are merely sickly and ailing and are often there for long periods. At present, even the largest of these, education is left to the sports of kindly volunteers who, being without teaching experience, naturally find the work a hopeless one, and all this happy opportunity is lost.

Infant and begonia Schools, Cottage Homes, etc. Of the children who are not many more left, and the largest number of children in any one school, etc. All together there are six of these institutions under the management of poor law authorities, and in many of them are of several unions, but in many of the separate schools are cottage homes. In these are taken the children from other unions without schools of their own and are admitted. The largest of the separate schools accommodates 750 children, but the usual number is about half that. It is curious that in poor law schools the number of girls is less by one sixth than the number of boys. No figures are available which would show whether this is so with regard to child pauperism generally, but it seems probable that it is chiefly so in regard to school pauperism. A widow asked to give up some of her children will be more likely to keep with her the girls, who are more useful at home and less "rackety" than the boys, while an orphan girl finds a home with a relation or a friend more easily than a boy. Such rescue from the taint of pauperism may not always be an advantage to the girl, who may find herself turned at a very early age into a little orphan drudge expected to give many hours of grateful washing up and sweeping and mending of the baby in return for her keep.

Leaving aside, for the present, the scattered homes and the remaining homes, the three remaining types may be shortly described.

(1) *The "Barack" School* — The typical features of this are large block buildings with

large dormitories, sometimes containing as many as a hundred beds, a large dining hall, and in general the "mass" method of treating the children with the necessary corollary of a machine-like exactitude in all the details of daily life.

(2) *The partially "Barack" School* — In this case there is the same style of block building, but the blocks themselves are divided up. Meals are taken in the one dining hall, but the dormitory system is not adopted. The children are grouped in small numbers, each group having its own section of bedrooms and playground and each group, therefore, being able within general limits to develop some individual differences and to have some escape from routine. At the same time the communal spirit of the school is developed by all taking meals together and sharing the one playground. In such schools the children are usually grouped by ages, and young and old are not mixed. The whole organization is akin rather to the middle-class boarding school than the public orphan asylum.

(3) *The Cottage Home* — Here the model is the home and not the school. The children are grouped in cottages or small blocks, with from eight to forty in each. See *Orphan Education*.

In any of these types the school may be under the management of the Guardians, or the children may go out to a public elementary school or may even be divided between the two kinds of establishment. The youngest of the children, those from three to five years old, are seldom admitted to the elementary school, and for them therefore the poor law must provide. The trained infant teacher is unfortunately rare and unfortunately again the untrained disciplinarian who drags their letters and their figures into them is more common than the equally untrained motherly woman who takes them to play in the fields and teaches them singing games. However, in the last of the schools the newer methods of infant teaching are growing up.

In other poor law schools the children receive instruction in the institution until they reach some particular standard, e.g. standard 4, and after that they attend a public elementary school. This is a peculiarly bad method because in these "partial" schools the equipment and teaching are very poor, the classes large and often more than one to each teacher. Thus the children tend to be backward, and when they do reach the outside school, they are behind those of their own age and at a disadvantage in learning.

Still another mixed class of education is to be found in those which send their children to the education authority's school for the ordinary hours and provide industrial classes in the poor law institution out of hours.

(1) *Scattered Homes* — These are a further extension of the home idea. Houses are

taken, if possible scattered about in a working-class district, and children in numbers from eight to twenty are placed in them under the charge of a foster mother. Their education is altogether obtained at the public elementary schools and, save that they are well housed, comfortably clad, and sufficiently fed, their lot in childhood is fairly comparable to that of their neighbors with whom they mix freely. In these scattered homes, however, the Guardians have practically nothing to do with the teaching arrangements for the children.

(5) *The Receiving Home.*—These have been established in several unions to serve a double purpose. In the first place they are used as quarantine for the children to be admitted to the schools. In the second place they are used as a net to catch the "Ins-and-Outs." These are the children of parents who are constantly coming into the workhouses and after short intervals taking their discharge. The law requires that their children should go with them and it can easily be imagined what a disturbing influence these children constitute in the poor law schools. Without the receiving home, or as it is also called the intermediate school, such children form a constant source of disturbance at the permanent school, and where provision is made, children of known "Ins-and-Outs" and temporary paupers are never taken on to the permanent schools at all. Many children, therefore, spend their school life alternating between the receiving home and the streets. (See interesting account of these children in the *Minority Report*, chapter on children.) As the former provides as a rule only a stop-gap form of education, the children learn very little, but the schools are in some instances among the best of poor law institutions. They show every variety, however, from one in which the school, though within a poor law building, is under the control of the education authority to one where all the children of all ages have instruction every morning from the assistant matron.

In unions without receiving homes the necessary period of quarantine is passed either in a separate building forming part of the school or in the receiving wards of the general mixed workhouse itself, or its nurseries. In the receiving wards the children are usually in the charge of the porter and his wife, and though attempts are made to place them in separate wards, it is usually impossible to keep them successfully out of contact with the drifting mass of adult pauperism passing in and out. No worse introduction to a new phase of a child's life, just at an impressionable moment when some catastrophe has brought it into the hands of the poor law, can be imagined than the dismal atmosphere of the receiving wards with their continuous stream of unhappy and degraded men and women.

Education and Instruction. Until 1897 the education in the poor law school had been divided in equal parts between ordinary instruction and industrial training. By an order of the Local Government Board, of January, 1897, this half-time system was abolished for children who had not passed the fourth standard or reached the age of eleven. This leaves it less open to the Guardians to withdraw the children from school work, and the practice in different schools varies according to their educational enthusiasm. In some, children are withdrawn from school altogether at thirteen. Others are beginning to encourage them to compete for scholarships given by the educational authorities and to maintain them when they win. Such cases are exceedingly rare and have gained much public notice. On the whole, book learning is rather despised by the Guardians as impractical and not assisting a child to make his living quickly.

Partly because of this and partly because there are so few poor law schools that the service offers little in the way of promotion, and partly because the Guardians are just beginning to realize the need of highly trained teachers, especially for the chief posts in their schools, the poor law service does not attract the best men and women in the teaching profession. The posts have improved since the time when the teachers in the earlier "barrack" schools were required to look after the children day and night. The great majority now are in residence at a separate building or live outside the school altogether. Still it is to be noted that taken all round the staff is of poorer quality and fewer certificated teachers are employed in the poor law service than in the public elementary schools. This is even more marked with the industrial teachers. In most cases they are the house mothers and fathers in the cottage homes or the caretakers of the children in the block dwellings, and the difficulty of finding good teachers is complicated by the need of finding in them also suitable officers for these other duties. For the most part, therefore, they are men and women who, whatever their knowledge of a particular trade may be, are not teachers either by experience or training.

The industrial training is of great importance because the children's future depends upon it. For the boys, the most usual trades are tailoring and bootmaking, and less often, gardening, carpentry, and baking. The brass band is also a notable feature at every poor law school, but only those boys are taken into it who are willing to enlist later on in the army or navy.

The opinion of the inspectors of the Board of Education is that the industrial training of the boys, whether as half-timers or as whole-timers, is too much sacrificed to the needs of the institution. Cobbling the school's shoes, mending the school's clothes, making the school's bread, and weeding the school's garden in

too often the aim rather than the thorough teaching, practical and theoretical, of the trade concerned. (See the *Report* above, p. 21.)

For the girls this is even more true. Their industrial training is always directed to the one end, that of making them domestic servants, for which there is always the demand and by which means they can become immediately self-supporting. Obviously, the temptation to train them by giving them the work of the institution to do is a great one and more or less all the Guardians fall into it. Occasionally they may be well taught, though their teaching is always of the practical and unintellectual description, but certainly they have a large amount of dull drudgery which the boys escape. The complaint against the "barrack" schools was that all the work was done on the factory system, labor-saving machinery being necessary with such large numbers, and that therefore the girls learned nothing of the way in which the work of a small household was carried on. The complaint with regard to the cottage homes is that the girls learn too much of the wasteful drudgery which characterizes the housework of the poorer middle class of to-day with their preference for cheap human labor rather than the simplest machine. It is usual for the two elder girls in each cottage to help the house mother in all the work, spending their whole time in cleaning, sewing and mending, washing and dressing the youngest children, and doing part of the laundry work and cooking, and in all these departments doing as a rule only the simplest but most tiresome operations.

There are two general criticisms of poor law schools, one strictly educational, the other perhaps more of a social nature. The first is that the schools, being very few in number, allow no scope at all for intelligent classification. Poor law children do not differ in kind from the rest of the child population and therefore show an infinite variety of types, requiring for their best development an infinite variety in their treatment. Probably the proportion of neglected and backward children may be a little higher than is normal, but even that is doubtful; and the regular food and good physical surroundings of the school would be expected to alter it very quickly. But the system provides practically no possibility of variation. There is the one small staff of teachers, the one class of school, the one range of trades to choose from. All the children must pass through the same mill, the brilliant and the dull, the normal and the defective, all share the same routine. The cleverer the child, the more quickly it passes through its standards and becomes a half-timer and finally a full-timer. Even the trade it learns is chosen just as much because there happens to be a vacancy in this or that workshop at the moment, as because the child has a talent for shoemaking or tailoring. The result is that

the level of attainment in a poor law school is very low and that there are few children in the higher standards. In the public elementary school, on the other hand, they do far better because there is some effort there to classify the children according to type. Thus in a poor law school it is usual to find in all the lower standards a sprinkling of defective children, who, instead of receiving special teaching, get along with the others as best they can, keeping the whole class down to the level of their own stupidity. There is also the deplorable mixture of the big children, who have been neglected all their lives and escaped the school attendance officers, having to sit in the poor law school side by side with the infants. This lack of classification necessarily lowers the whole standard of the instruction given and forms a cause of great depression to the unfortunate teachers, who find their classes loaded with defective or backward children.

The second criticism is that the life in the schools has too little relation to the life outside to form a really satisfactory foundation for the children's future. The complete separation of the bigger girls and boys, which is customary, no doubt makes management easier, but it certainly makes the school life artificial. The ordinary child who goes to boarding school has at least holidays at home, where there are brothers and neighbors. The poor law child has no home but the school. There are beginnings of a more liberal spirit in these matters, and some Guardians have even arranged for a yearly trip to the seaside for all the children, though here again the boys and girls go separately. But in some schools there is a freer intercourse, and the children of fourteen and fifteen are being allowed to go about more freely and to undertake greater responsibilities. The older girls in some homes, e.g., are sent shopping and thus are gaining something of that sense of the real importance of things which the handling of money gives. It is unnecessary to point out that when the children attend the elementary schools and mix with others, they gain far more knowledge of the world than they could within the bounds of an unmixed poor law school.

Children in Institutions not under the Control of the Guardians — The third division only is of importance here. A few of these are homes for children over school age who are difficult to manage and cannot be found places, but nearly all are the certified schools which have been mentioned above. These are largely Roman Catholic and managed by religious orders. They take a very high place with regard to athletics, but on the whole are much like the poor law schools. It should, however, be noted that there were in 1908 as many as 260 certified schools, and that only sixty-one of these were being inspected by the Board of Education. It is therefore impossible to say

anything of the education given in the remaining 208, some of which are homes only, with no schools attached. (See *Report to the Board of Education by Tiffard and Syngo*, above, and *Minority Report*, chapter on children.)

Cost of Maintenance.—The cost of indoor treatment of pauper children is by no means slight. The cottage homes cost from £100 to £260 capital expenditure and from £30 to £55 for each child annually. The cost of children in the workhouse has not been distinguished from that of other inmates, but it may certainly be reckoned at something less than £25. The scattered homes cost from £18 upwards, and the schools vary upwards from £25 to £50. In the "certified schools" the charges made on the Guardians are lighter, the children costing from £12 to £18 a year.

After Care.—It only remains now to touch upon the question of the after care of the child pauper. By law Poor Law Guardians may pay for apprenticing the child of any poor person within the parish—whether he be a pauper or not. But this law, introduced in accordance with the recommendations of the Poor Law Commissioners in 1834, has been a dead letter. The Guardians have restricted their attention altogether to the boarded-out and indoor pauper children, and these alone have shared in these benefits. The apprenticeship for which the Guardians are permitted to provide premiums is the old-fashioned indoor apprenticeship which has almost ceased in England. So far as it is still carried out, boys are apprenticed to the small employer, who, with old-fashioned tools and much hand labor, carries on the work, e.g., of the shoemaker, blacksmith, tailor, or carpenter. The amounts paid in premiums are exceedingly small and the field is thereby narrowed still further.

It is, therefore, no wonder that other ways of dealing with the poor law boys have been instituted. For some who are learning trades in the ordinary way or for those who go into offices, Boys' Homes are being made use of, and the Guardians in rare cases have established or are about to establish these for themselves or are making use of voluntary institutions. Farm service absorbs some lads, others go into coal-mines or to the trawlers, while a large number are enlisted in the bands of the army and navy. Through the *Exmouth* training ship, a good number go into the mercantile marine as well as the navy. Out of the 608 boys placed out by the Guardians of London in 1909 from district, separate, certified, or other schools, 159 went into the army and navy,—more than twice the number who went into any one trade,—and 68 went into the mercantile marine. Other employments included: farm hands, gardeners, etc., 68; shoemakers, 41; domestic service, 34; bakers, 32; office boys, shop and

errand boys, 30, tailors, 21; etc. In addition to these, 140 were sent to Boys' Homes to be found work from there. Unfortunately, similar figures are not available for other areas, but there is no reason to suppose, apart from local variations due to predominant trades, that many changes occur.

For the girls, the only future is that of domestic service. Out of 600 girls in the London area placed out in one year, 582 became domestic servants, and the remaining 18, though not so classified, have taken altogether little different in kind. Sixteen are laundresses, dairy-maids, children's maids, and helpers at cottage homes. One has become a teacher to the blind, and one a lacemaker. It is usual to find that only defective girls, mentally or physically defective, are not sent to service.

Once sent out into the world, the great difficulty of poor law management is to keep them there. Except for some supervision of indoor apprentices, the poor law intrudes as little as possible, and the children are either left without any supervision, are occasionally seen by Guardians or officials, or are handed over to voluntary associations (where such exist) like the Metropolitan Association for Befriending Young Servants. It is recognized that the success in life of the young people depends on the seeming absence of all connection with pauperism—but it is impossible to exercise responsibility and hide all traces at one and the same time. A further difficulty lies in the fact that children who at sixteen years have been found no occupation or have lost a place provided for them, can no longer be kept in any poor law institution but the general mixed workhouse, and it is to this that even the young servant girl will have to return in any interval between her places. Probably a more unsuitable home for a young girl could not be found than the women's wards which constitute her only certain refuge. Once having spent some time there, she is unlikely to return to an independent position in useful work.

It will be seen that throughout the dealings of the poor law with destitute children, the one uniform tendency is to push the poor law further and farther into the background. The education authorities, the Home Office, and voluntary organizations are more and more taking up the work. The best Guardians, throwing aside the old principle of "leaver eligibility," have tended to place the education of their indoor pauper children in the hands of the education authority and their after care in that of voluntary organizations; or if not this, they have at least placed the children both during and after school life in homes as far as possible from the hated workhouse. The outdoor relief children, never educated by the Guardians, are now coming under the education authority, not only for teaching, but for feeding and medical attention as well.

POOR, SCHOOLS FOR

The whole development of the treatment of destitute children points to the fusion of the poor law, so far as it deals with them, with the education authority whose responsibility for the welfare of the future of the nation through the care of the children of to-day is being continuously and almost unconsciously increased from day to day. Such a fusion would not only simplify present methods and satisfy the desire for logical treatment of an administrative problem, but would make it possible to bring about many improvements in the care of destitute children for which Poor Law Guardians have for many years striven in vain.

PORSON, RICHARD (1759-1808). — English scholar and Regius Professor of Greek at Cambridge. He was the son of the parish clerk at East Hutton, Norfolk, and early showed such ability that a patron undertook to send him to Eton. Later, a fund was raised by old Etonians to send him to Cambridge, where he entered Trinity College in 1778, obtaining a scholarship in 1780. In 1782 he obtained a fellowship, and in 1783 he proceeded to the M. A. Refusing to take orders, he was compelled to resign his fellowship in 1792, the year in which he was elected Regius Professor of Greek. For a long time he was in great financial straits, although friends had raised a fund to give him an annuity. In 1800 he became principal librarian of the London Institution. He died in 1808. Porson's only interest was in study and scholarship. As professor at Cambridge he never delivered a single lecture and lived in London most of the time. His literary activity was limited to the twenty years from 1783 to 1803, beginning with a number of reviews. In 1790 he attracted attention by the *Letters to Traxia*, proving the spuriousness

PORT ROYALISTS

of 1 St. John v. 7, and by his preface to Toup's *Emendations on Nidas*. In 1797 he published an edition of Euripides' *Heccuba*, in 1798 the *Orestes*, in 1799 the *Phœnix*, and in 1801 the *Medea*, the only one issued under his name. In a second edition of the *Heccuba* (1802) he wrote a valuable supplement dealing with the Greek meters. Porson had also laid the foundations for editions of *Æschylus* and *Atheneus*. His remains were published later by his friends. Porson's contribution to English scholarship was to introduce high standards of scholarship and accuracy in textual criticism, which influenced Cambridge for more than fifty years after his death.

PORT ROYALISTS. — The name given to a community of recluses, established by Jean Baptist du Vergier d'Hauranne, Abbé de St. Cyran. St. Cyran (1581-1643), as he is usually called, was a friend of Cornelius Jansen (1585-1638). The two, Jansen and St. Cyran, were especially united, from their student days, in a common devotion to the writings of St. Augustine (q.v.). St. Cyran was a native of Bayonne; and met Jansen (of Dutch birth) as a fellow-student either at Louvain or Paris. In 1611 the two friends retired to Champré, a house by the seaside near Bayonne, determined to follow the example of the schoolmen, by going to the fountain head of theological patristic knowledge, in St. Augustine. At Champré they remained together for five years in the closest study. In 1620 St. Cyran was made abbot of the abbey of that name. In the same year he first met M. d'Andilly Arnauld, and "from that moment," Arnauld said, "our friendship began, and, up to the time of St. Cyran's death, continued to be as complete as it is possible in this world for friendship to be." The connection between Jansenism and Port Royal can now be made clear. St. Cyran and Jansen were thoroughly permeated with Augustinian theology. St. Cyran, though separated from Jansen, was still in the fullest sympathy, and in close correspondence, and passed on the Augustinian views to Arnauld, while Arnauld's sister, the Mère Angélique, the abbess of Port Royal, was drawn to imitating St. Cyran the spiritual director of herself and her convent. Thus the Jesuits characterized the origin of Port Royal des Champs: *Paulus grand Augustinus; Augustinus, Calvinus; Calvinus, Jansenius; Jansenius, Sancyranus; Sancyranus, Arnauldus et fratres eius*. In 1626 la Mère Angélique had left Port Royal, in consequence of an outbreak of fever. It was afterwards, in 1637, occupied by "solitaries," a brotherhood who wished to give themselves up to the leadership of St. Cyran and to devote themselves

to prayer and study. Amongst these were M. le Maître, distinguished as a lawyer; the teacher of Racine the dramatist; M. de Sarcourt, prominent as a soldier; M. de Sael, trained for the Church, who became, after Singlin, the successor of St. Cyran; the spiritual director of Pascal, the most brilliant writer of the Port Royal. The most active member of the brotherhood was Antoine Arnauld (q.v.), nephew of D'Andilly, and son of the celebrated advocate, Antoine Arnauld, who defended the University of Paris against the Jesuits in 1604. Along with these members of the Port Royal brotherhood were such men as Lancelot, Fontaine, Nicole, Guyot, Coustol — names of high importance in educational history. Such a galaxy of illustrious men probably never issued from so small a community as Les Messieurs de Port Royal des Champs, and it is significant that men of such high standing, both socially and professionally, when brought face to face with the problems on the highest spiritual plane, realized the necessity of the keenest attention to education.

Educational Work.—In his chapter on *Les Messieurs de Port Royal*, Dr. Charles Board describes the daily life led by these gentleman monks, erstwhile courtiers and men of the world, from three in the morning till the night, and their occupations in religious devotions, in four hours' hand labor, in govern self-denial and discipline, works of charity and of piety, besides the participation in special work for which there was special ability in the individual, or special need for the community. Education was particularly marked out by St. Cyran as a special need to be supplied by these "solitaires." St. Cyran was full of affection for children and established schools which he called *Petites Écoles*, a term which might show that the Port Royalist schools were without the pretentiousness of the Jesuits, who aimed at competing with the universities. He suggested six as a suitable number of pupils for a *Petite École*, for which number he desired a Latin master and a good priest. It is said that St. Cyran always showed a respect to children, "that in them he might honor Innocence and the Holy Spirit who dwells with it." But, on the other hand, he was ready to speak sharply to the pupil reading Vergil, for Vergil had procured damnation by writing for vanity and glory, and told the boy that he must try to save himself by only reading such authors by whom he would fit himself for the better service of God. He thought the bringing up of children in piety was the greatest of human charities (after dying for another's good), and that in death the greatest consolation must be the thought of having contributed to the good education of some child. The three necessary maxims for training children were: to speak little, hear with them much, and pray more. He realized that teachers should have the more love for those

who are unformed and backward. Punishments were only to be resorted to after every effort of love had failed. With the good teacher it will seem necessary *plus prier que crier*, to speak more of them to God than of God to them. Claude Lancelot (q.v.), the devoted Port Royal schoolmaster, says St. Cyran set everybody, on every opportunity, to teaching. Lancelot joined the community in 1643 on the death of St. Cyran.

Lancelot was the greatest of the rational educationists, not only of the Port Royalists, but from the standpoint of linguistic teaching of all the teachers of the seventeenth century. Antoine Arnauld and Pierre Nicole were greater thinkers, but without so keen a grip of the methods for learning languages. These latter two were the joint authors in 1660 of the *Grammaire générale*. Lancelot, in writing his methods of linguistic teaching, noted some of his difficulties and consulted Arnauld. The work has no marked pedagogic characteristics, but it has its place in the development of the study of comparative grammar.

Arnauld's rôle, educationally, was that of suggester rather than of writer. In 1663 he again took part with Pierre Nicole in a joint production, viz. the famous *La Logique, ou l'Art de Penser, contenant, entre les Règles communes, plusieurs Observations nouvelles, propres à former le Jugement*. Arnauld undertook to impart in four or five days to the *Mademoiselle de Chevreuse* all the logic worth knowing. The work includes a treatment of the principles laid down in the *Discours de la Méthode* of René Descartes (q.v.). The introduction of the Method of Descartes requires to be noted specially, for the Jesuits had assailed his system of philosophy, and the acceptance of his views by Port Royalist writers was calculated to court the further enmity of the Jesuits. The whole tendency, however, of the Port Royalists, educationally, was very largely represented in Descartes' views, not only in the acceptance of common ground in the foundation of educational method, but in other points, as, for instance, in the comparison between the ancients and the moderns. Descartes had taken up the side of the moderns, even urging that there should not be blind following of the ancients in questions of literary taste and standards, and such a position helped the Port Royalists in their advocacy of the vernacular, and the whole tendency of the new views with regard to the value of the vernacular made Racine's influence possible, in and through the French language, while the whole cause of the extension of philosophy and science was promoted by Descartes' use of the vernacular French in his treatise on method. The direct influence of philosophy on educational method had thus never been more strikingly illustrated than by the way in which the Port Royalists and other reformers applied Descartes' principles and followed his example.

PORT ROYALISTS

Pierre Nicole had written a Latin textbook, *Epigrammatum selectus* (1659). This was a logical result of the Jansenist religious position — for its object was to omit from the selection of epigrams those of Martial and Catullus and others, which were morally unsuitable matter for youthful or, for that matter, for adult consideration. It was a school textbook which had a very wide circulation both in France and elsewhere. Nicole also wrote the *Essais de Morale* in six volumes, which Voltaire declared would "never perish." They contain no systematic scheme of ethics; they are, moreover, full of images expressing "the mean wretchedness of man and the eternal blackness of his fate." Among Nicole's *Essais de Morale* is the *De l'Éducation d'un Prince*. Nicole writes on the point that, at the best, masters do nothing but "expose the things [of knowledge] to the interior light of the mind by which alone they can be understood."

Other Port Royal educationists were Guyot and Coustel. Thomas Guyot was the writer of a number of translations from the classics into French, and thus was important in the status given to French in education. He translated the *Capitula* of Plautus in 1666; Cicero's *Letters to Atticus* also in 1666; other letters of Cicero in 1668; the *Bucolics* of Vergil in 1670. He published a collection of *Epigrammatic Flowers from Ancient and Modern Writers* (1669). Coustel in 1687 drew up *Rules for the Education of Children* described by Félix Cadet, as "the most complete and methodical work of Port Royal on pedagogy that remains to us."

Finally, for the education of girls there were the *Constitutions* of the monastery of Port Royal, and the *Regulations for the Children of Port Royal*, drawn up by Jacqueline Pascal, sister of Blaise Pascal.

Schools. — The Port Royal schools were very small in numbers, ordinarily from twenty to twenty-five; only once they numbered fifty. Each master had only five or six boys in charge, day and night, the number being arranged so that a master should have no more pupils than the number for whom he had space in his own bedroom. As early as 1637 Singlin, on the suggestion of St. Cyran, had received two or three children at Port Royal des Champs. The numbers afterwards were increased. In 1644 the children were removed to Le Chenai, near Versailles. They then returned to Port Royal, but in 1610 were removed to a house in the Rue St. Dominique d'Enfer in Paris, when the school was fully organized with the four masters, Lancelot, Nicole, Guyot, and Coustel, each of whom had a room with six scholars. In 1653 the schools were removed from Paris, and in 1660 they were finally closed by Louis XIV. The day's life and work in the schools is described in Dr. Charles Beard's *Port-Royal* (1861),

PORTO RICO

Vol. II, pp 140-141. In 1720 Charles Rollin's *Traité des Études* appeared, a work which summed up the best and most advanced pedagogical practice of the universities and colleges of the times. This treatise shows how far the methods of classical and linguistic teaching of the Jansenists had penetrated into the best practice of the following generations.

PORTO RICO, ISLAND OF. — An island, the easternmost part of the Greater Antilles group, bordering on the Caribbean Sea, and acquired by the United States as one of the results of the Spanish-American War of 1898. The island contains 3435 square miles, which is about three fourths the size of Connecticut. The island had a total population in 1910 of 1,118,012, and a density of population of 325 persons per square mile. For administrative purposes the island is divided into 66 municipalities, or townships. For purposes of school supervision these are grouped into a number of supervisory districts (43 in 1910).

Educational History. — The Spanish had helped to maintain some form of religious schools in the island for a long time previous to the American occupation. At this time the school system of Porto Rico consisted of 380 schools for boys, 148 for girls, or a total of 528, and with an attendance of 18,243 chil-

dron. All of the schools, with one exception, were housed in rented buildings, which also served as living quarters for the teacher and his family. The schools were of the tuition type, with some provisions for pauper pupils, tuition being charged for all children whose parents or guardians were able to pay. Eighty-five per cent of the population of the island could not read or write. The course of study in the schools consisted of reading, writing, Spanish grammar, church history and doctrine, the elements of arithmetic, with weights and measures, the merest elements of geography, and an elementary outline of agriculture, industry, and commerce. A few days after the establishment of the American military government, a mass meeting at San Juan adopted resolutions asking for the establishment of a general system of public education, gratuitous and compulsory, and after the American type. Two months later, at the close of the year 1898, General John Eaton was appointed by the Secretary of the Interior of the United States to visit Porto Rico and to reorganize the school system. Early in 1899 he formulated a new school law for the island, and this was issued May 1, as a military order. General Eaton was made chief of the new Bureau of Education thus established. The new school law provided for a local school board of five members in each of the sixty-six barrios, or townships of the island, and defined the duties of these boards. A series of twelve military orders provided for the abolition of the fee system, and for free schools; a school year of nine months; a graded system of schools; not over fifty pupils to the teacher, and principals of schools, the salaries and the certification of teachers; free textbooks and supplies; fixed the legal relations of the barrios to their schools; and provided for a system embracing elementary, secondary, normal, and professional schools. One order also reformed the course of study. Church doctrine and religion were dropped, and the essentials of an American elementary course of study were substituted, with both Spanish and English as languages.

In August the insular Bureau of Education was abolished, and an insular governing board substituted. On May 1, 1900, this was superseded by the provisions of the Foraker act, establishing civil government, and a Commissioner of Education for the island, appointed by the President of the United States, succeeded to the control of the educational system of the island. At the first session of the insular legislature the new Superintendent, Dr. Brumbaugh, secured the enactment of a new school code. This, although somewhat amended since then, has remained as the basis school law of the island, and the present organization, in large part, follows the lines laid down in this code and is given, together with subsequent modification, in the following sections.

Present School System. -- At the head of the present school system of Porto Rico is a Commissioner of Education, appointed by the President of the United States, for a four-year term. He has a seat in the upper house of the legislative assembly of the island. He also acts, *ex officio*, as President of the Board of Trustees of the University of Porto Rico (which here means practically as President of the University), and of the trustees of the insular library. He appoints all subordinates in the department, except certain classes of teachers. Aside from teachers and clerks, these consist of an assistant commissioner, a department secretary, a chief of the division of property and accounts, a chief of the division of school building accounts, three general superintendents, and a sufficient number of supervising principals (forty in 1910) properly to supervise the schools of the island. The Commissioner in person or through his subordinates is required to supervise all public education on the island, to approve all transfers of school funds and all disbursements for educational purposes; to prepare all courses of study, to determine the length of the school term; to approve all plans for school buildings; to approve nominations for teachers in the schools, and to have charge, through an appointed board of examiners, of the examination and certification of the teachers of the island. He organizes high schools and new educational undertakings, as appropriations permit, and makes an annual report to the Governor of the island.

The form of educational organization of the island is that of a small New England state, organized on the town or township plan, each town reporting to and being under the supervision of one central authority. The island is divided for purposes of civil government into sixty-six municipalities (townships), for each of which a local school board, consisting of three citizens elected by the people, for four-year terms, is provided. Each board elects a treasurer, who handles the funds. These boards have charge of the elementary school buildings of the municipality, erect and repair the school buildings, or rent buildings for school purposes, and pay teachers their house-rent grants, and, in the larger municipalities, their salaries also. Each board nominates, annually, to the Commissioner of Education the names of the teachers it wishes to employ, and, after his approval, proceeds to elect the same.

For purposes of school supervision the municipalities of the island are grouped into supervisory districts. At first the number was sixteen, in 1902 raised to nineteen, and by the law of 1907 changed to thirty-five, and provision for an automatic increase made. In 1910 the number was increased to forty-three.

For each of these supervisory districts a supervising principal is appointed, who acts

as the immediate representative of the Commissioner. These receive salaries of \$1600, \$1400, and \$1200, with an allowance of \$240 additional for house rent, and \$200 further for traveling expenses in districts consisting of more than one municipality. The supervising principal is *ex officio* a member of the school board of his municipality, with the right to speak but not to vote. He has an office, though he spends the greater part of his time in supervising instruction. He performs such duties as are assigned to him, and makes a monthly and an annual report to the Commissioner of Education. In 1909-1910 these officials averaged thirteen visits to each teacher for the year. The three general superintendents devote the greater part of their time to field work, such as consulting with school boards and supervising principals, conducting teachers' institutes and meetings, giving public addresses, and helping to organize school play grounds, school savings banks, and libraries. The assistant commissioner of education is at the head of the department of supervision, and to him the supervising principals and the general superintendents report.

School Support.—The support for the schools of Porto Rico comes from two sources, — insular appropriations and local (municipal) tax levies. For the last year for which reports are available, about 30 per cent of the funds came from local sources. This does not include the University of Porto Rico. The insular portion of the expenses consists of a large annual legislative appropriation for maintenance (salaries, administration, textbooks, summer schools, scholarships, — \$851,000 in 1910), and supplemental appropriations for school extension work, school building loans, rural school purchases, and miscellaneous expenses. The municipal portion consists of funds derived from taxation and used for the rent of schoolhouses, the house rent of teachers, equipment and furniture, construction of school buildings, salaries of employees, and contingent and general expenses.

Teachers and Training.—The teachers of the island are divided into six classes: rural, graded, principal, English, special, and high. The first three classes are elected by the local school boards, after approval by the Commissioner. Graded teachers are divided into two classes, — those teaching in English and those in Spanish schools. The teachers of English, the various special teachers, and the high school teachers are appointed directly by the Commissioner of Education. The assistant commissioner, the three general superintendents, and the chief of the division of records constitute an Insular Board of Examiners, who certificate all teachers. The certification and supervision are thus kept closely united. Different certificates are issued for each class of teachers. With the develop-

ment of the normal school, the number taking the examinations for rural and graded certificates is gradually decreasing. There is a uniform salary schedule, under which all teachers of the same class are paid the same monthly salary. This varies from \$30 to \$80 a month, with varying additional allowances for house rent.

The first teachers were American teachers, imported for the purpose. These have since been almost entirely displaced by native teachers, and the policy is to provide native teachers, whenever competent. For the training of future teachers, the insular government maintains the Insular normal school at Rio Piedras, seven miles from San Juan.

Educational Conditions.—The school system consists of rural, graded, and high schools; night schools; and normal, collegiate, and technical instruction. The rural schools are by far the most numerous. Many of these are in rented buildings, and as yet poorly housed and poorly supplied with furniture and teaching equipment. The first rural schoolhouse was built in 1901, and by 1910, 102 one-room and 12 two-room rural school buildings had been built and were owned by the municipalities. This was 25 per cent of the schoolrooms in use that year. There were in the same year 671 rooms in town graded schools. Up to 1908 the rural schools offered only the first three grades of school work, but in 1908-1909 the fourth grade was added in most of the schools, and in 1909-1910 the fifth grade in quite a number, and in 1910-1911 the sixth grade, wherever demanded. A few centralized rural schools have been organized in the more thickly populated municipalities. The course of study for the rural schools consists of six years' work, the first year in Spanish and the remainder in English. The schools in the sixty-six towns and cities of the island, as well as a few schools elsewhere, are carefully graded, and compare favorably with the better school systems of the United States. In three fourths of the towns the instruction covers the eight grades, and the seventh in nearly all of the others. The ninth grade is also maintained in one third of the towns. The town and city schools have good buildings and equipment. Up to 1910 seventy graded school buildings, with a total of 406 schoolrooms, had been erected since the American occupation. In a number of the schools double enrollments and half-day sessions are necessary to accommodate the children who come. The department maintains partial or complete high schools at about twenty places in the island, and the four-year high schools at San Juan, Ponce, and Mayaguez are said to compare favorably with American high schools, and to prepare students for admission to the standard American colleges. The insular legislature provides for a large number of high school scholarships for deserving students.

PORTO RICO

Night schools are maintained in practically all of the municipalities. Most of the attendants in these are adults. Many of these are being established in the rural regions, for the education of the people. Instruction in domestic science, manual training, drawing, and agriculture have so far made but small headway, but the beginnings of such instruction have been made. Playgrounds were established first at Ponce in 1908-1909, and a number of towns have since provided playgrounds and playground equipment. Savings banks have been organized in many schools, and have developed much interest, many pupils withdrawing from the school savings banks to start deposits of their own in the regular banks. School libraries were begun in 1908-1909, and within a year and a half 233 libraries had been organized, and only six municipalities were then unrepresented. All now have libraries, and the number is rapidly increasing. Text-books have been standardized throughout the island, and are furnished free.

The school system is being extended gradually so as to provide for all of the children on the island. The course of instruction is being lengthened in the schools, and more and more children are being enrolled. In 1907 the total enrollment was 54,985, in 1909 it was 87,230, and by 1911 it was 145,525. The number is still somewhat small.

Higher Education.—The University of Porto Rico was established by the insular legislature in 1903. It consists of the insular normal school, at Rio Piedras (first organized in 1890), the college of agriculture, at Mayaguez (1903), and the recently organized (1910) college of liberal arts, at Rio Piedras. The normal school requires the completion of the ninth grade for admission, the college of agriculture the eighth grade, while the college of liberal arts is to be organized on the basis of the same entrance requirements as laid down by the College Entrance Board (*q.v.*) of the United States. For some time the insular legislature has appropriated sums to provide scholarships for study in the colleges and universities of the United States, but the number has been materially reduced in recent years, and they may soon be abandoned. Since 1911 municipalities have been permitted to provide from one to two scholarships, of \$350 each, for the study of agriculture or engineering in American colleges.

The University of Porto Rico receives an annual appropriation for maintenance from the insular legislature; the proceeds of certain fines, escheats, and franchise royalties, the income from a permanent endowment fund, created from 25 per cent of the proceeds of the sales of public land; and the annual appropriations made by the United States to agricultural and mechanical colleges for experimental stations and instruction in agriculture. It has a large income, considering its present

PORTUGAL

needs and the amount spent for all other forms of education.

PORTUGAL, EDUCATION IN.—Portugal cherishes traditions of culture extending back to the period of Roman domination in the Iberian peninsula, but this period and that of the subsequent invasions of the Visigoths and Suevi, and of the Arabian incursions, do not in reality belong to the national history, since the existence of Portugal as an independent kingdom dates from the close of the eleventh century. In 1091 Alfonso VI, son of Ferdinand the Great, conferred the country of Portugal upon Count Henry of Burgundy; the title King of Portugal was first borne by Alfonso Henriques, son of Count Henry, famous for his heroic contests against the Mohammedans. His son Dom Sancho I, who succeeded him in 1185, was forced to continue this contest, but his talents as an administrator were shown by the encouragement he gave to agriculture and to the growth and trade of towns. Both to cities and to noblemen he granted large tracts of land on condition that they should be occupied and cultivated. By this measure he laid the foundation of Portugal's subsequent prosperity. The period of war and territorial expansion continued through the three succeeding reigns, and it was reserved for Dom Diniz, who came to the throne in 1279, to resume the interrupted work of the internal development of the kingdom. He founded agricultural schools, encouraged improved methods of farming and the cultivation of forests, stimulated commerce, especially by a commercial treaty with England, created the royal navy, made his court the literary center of the nation, and founded a university at Lisbon, which was subsequently removed to Coimbra (*q.v.*). All these conditions combined—commercial expansion, the enterprise of free cities, the thirst for glory—went in the end to the making of Portugal's heroic period, which culminated in the sixteenth century with the discoveries of Vasco Da Gama, Amerigo Vesputi, and Albuquerque; in the trade with the "Gold Coast" and with India; in the settlement of Brazil; and in a national school of poetry, of which Camoens was the inspirer.

In the schools which produced these men of varied talents the classics were taught and the known sciences, geography and astronomy; but the schools were few and ignorance prevailed, as may be inferred from the address of

PORTUGAL

the national poets, who spared neither judges nor prelates in their revelations.

In the middle ages popular education was generally neglected in Portugal. Fragmentary records of elementary schools existing in the fifteenth century are still extant; chief among these a municipal school which was maintained at Evora as early as 1438. The master, a bachelor of arts, taught the elements of Latin to all who desired to learn. In the sixteenth century the number of schools and teachers increased. According to well-authorized accounts there were at Lisbon, in 1581, thirty-four masters of reading and writing, besides seven who taught the Latin grammar, and two women teachers for the instruction of girls.

King John III, whose reign marked the decline of Portugal's power, showed interest for a time in the education of the higher classes. By his direction the university was removed to Coimbra and reorganized, and a college of arts was established to prepare students for the higher curriculum. Subsequently the spirit of intolerance possessed the king. In 1517 he introduced the Inquisition and, shortly after, invited the recently created order of the Jesuits into his realm, gave them direction of the college of arts, and in the end complete monopoly of all education, public and private. The Jesuits confined their attention to the sons of the higher classes, and no general effort was made in the interest of popular education before the eighteenth century. One of the greatest statesmen of this age was the Marquis of Pombal, who practically directed public affairs in Portugal during the reign of King Joseph, which began in 1759. In his measures of reform, the Marquis of Pombal included a system of education which was put into operation in 1772. This system provided for the establishment of a school in every district, regular inspection by government officials, examinations of candidates for teachers' positions, and the appropriation of a special fund for educational purposes. Within a year from the formal adoption of the system, 440 schools were opened on the mainland of Portugal, fifteen in the islands, and twenty-four in the colonies. The next year the number was increased by fifty-seven. The death of King Joseph (1777) deprived his great minister of authority and the fears excited by the French Revolution and the later conflicts, which disturbed all Europe, prevented further progress in education for more than half a century. A slight renewal of the interest in 1820 and again in 1835 showed that Portugal was affected by the democratic movement of the time, and in 1844 an education code was enacted by the legislature which marks the beginning of the present system of popular education. This code, which remained in force till 1881, required parents to secure the education of their children, under penalties for neglect; provided for a central educational

PORTUGAL

council with delegates in every district; and recognized two grades of popular instruction. Later, normal schools were founded at Lisbon and a department of education was created under the charge of the Minister of the Interior.

Present System.—The education law of 1881, prepared by Antonio Rodrigues Sampaio, transferred the control of public instruction from the central government to the municipal authorities and local school boards, and a period of great activity in the establishment of schools followed. In 1890 the central government resumed the control of public schools, creating at that time an independent Minister of Education. Two years later (1892) this office was abolished, and the Minister of Interior became the responsible head of public instruction; centralized control has been continued to the present time. The Minister is assisted by a supreme council; there are no permanent school inspectors, but special inspections are ordered as occasion seems to require. The financial burden of primary instruction is borne chiefly by the municipal authorities, but they are simply the agents of the government in respect to the establishment and equipment of schools. The supervision of schools is intrusted to district superintendents. The government prescribes the subjects of the primary school course and the textbooks to be used in all schools, public and private. Every five years a competition for the best set of books is ordered, the decision being made by a jury composed of professors and teachers.

Primary Schools.—The law requires that every parish shall have one public school for each sex, unless the population is so small or scattered that one mixed school is sufficient. In thickly populated districts, requiring more than one school for each sex, central schools may be established, consisting of four graduated classes with a master for each class. Where the population is too scattered for a permanent school, peripatetic classes are authorized for instruction in the elements and religious doctrine.

The primary instruction law of 1897 recognizes two classes of primary schools, elementary and higher. The latter are limited to towns and villages having 4000 or more inhabitants; in fact, they have been established only in connection with normal schools. The elementary school is divided into two grades: the first of these comprises three classes which cover the period of compulsory school attendance, i. e. six to twelve years of age, unless a certificate of exemption is secured before the upper age limit is reached; the second grade consists of one class, and only children who complete this grade are admitted to secondary and technical schools.

The subjects of primary instruction are shown in the following time-table pertaining to the third and fourth classes.

PORTUGAL

SUBJECTS	NUMBER OF LESSONS A WEEK			
	3d class		4th class	
	Boys	Girls	Boys	Girls
Reading	4	3	3	2
Writing	2	2	1	1
Arithmetic	3	3	3	3
Moral and religious teaching	1	1	1	1
Dictation	3	3	3	3
Drawing	2	1	2	1
Manual work		3		1
Grammar	3	2	3	2
Geometry			1	1
History			2	2
Geography				
Total	20	20	21	23
Total hours	20½	20½	20½	20½

The subjects given above are greatly extended in the higher primary or complementary schools, and singing, gymnastics, and natural science are added.

Schools must be regularly inspected by a physician, and children cannot be admitted unless they present a certificate of vaccination. A child is excluded if any member of the family is suffering from a contagious disease.

Candidates for teachers' positions must hold the certificate of a normal school, or a departmental training school, or a secondary school. The appointments are made by the minister, at first for a probationary period of three years. When this term is successfully completed the appointment is made permanent.

For the training of teachers there are four state normal schools, one for each sex at Lisbon and at Oporto; at the chief town of each department there is a preparatory school with a special class for training teachers. The expenses of the normal schools and a part of the cost of the departmental training classes are borne by the central government, the municipalities providing the buildings and fittings for the classes. The four normal schools control 180 scholarships for poor and deserving students, which are awarded upon the results of a competitive examination.

The law of 1834 accorded the title of professor to the principals of primary schools. The salaries consist of two parts: (1) a fixed sum according to the class of the teacher, which is continued in case of necessary absence from duty; (2) a sum which is allowed only for active service. The annual salaries for the different classes of teachers as determined by the law of Dec. 21, 1901, are as follows: 3d class, \$150; 2d class, \$180; 1st class, \$220.

The annual salaries of teachers of the higher elementary schools range from \$220 to \$340. Assistant teachers receive \$85 as their class salary and an additional \$33 for service. At Lisbon and Oporto teachers are furnished free residence, or a money equivalent for the same.

PORTUGAL

Maternal schools for children three to six years of age are recognized as part of the system of public instruction, and, also, in localities where the population demands, evening continuation classes for men and for boys above twelve years of age.

Schools under private management, most of which are maintained by religious orders, are restricted only by the obligation to use the textbooks officially sanctioned. "Dominical" schools hold classes for women on Sundays and Saints' days, which afford very complete continuation courses. The *Real Casa Pia*, an orphanage at Lisbon, is a model institution. It maintains the full course of primary instruction, courses in foreign languages, and a well-equipped industrial workshop. Among the associations of workmen which maintain primary schools, the most important are the *Voz do Operário* and the *Grêmio Popular*.

While popular education has been accepted as a responsibility of the state for more than a century, progress in its actual development has been slow and uncertain as indicated by the high degree of illiteracy. In 1900, 78 per cent of the people above six years were in the illiterate class. The latest official statistics of school attendance, which pertain to the year 1900, show an enrollment in public primary schools of 177,540 pupils; in private primary schools, 49,887; or a total enrollment of 227,225, equivalent to 5 per cent of the population. The political disturbances that have taken place during the past decade make it improbable that there has been any decided increase in school attendance. Hence it may be inferred that above 70 per cent of the children of school age are not under instruction.

Secondary Education. -- Secondary education in Portugal as in other countries of Europe is preparatory to university studies, but it has not the social exclusiveness that prevails generally on the Continent; pupils may pass directly from the higher primary schools to the secondary, and although the latter are not free schools, the fees are small. The present organization of the secondary department dates from a law of 1894. In accordance with its provisions, Portugal is divided into three administrative or academic areas, the centers of which are, respectively, Lisbon, Coimbra, and Oporto. A secondary school, *lyceum*, is maintained in the chief towns of every department. These schools are of two orders, central schools at the administrative towns, and national schools. The former are organized in seven classes; the latter have only five classes, and pupils pass from them to a central school for the last two years of the course. There are at present thirty state lycées and one municipal secondary school, with a total registration in 1910 of 8000 students; there is also one public lyceum for girls at Lisbon, which in the same year had 550 students.

There are also private secondary schools which

PORTUGAL

must be open to government inspection and use the official textbooks. They prepare students for the government examination just as the public lyceums do.

The subjects included in the program and their relative importance are indicated by the following tabulation, which shows the weekly distribution of lesson periods for the fifth and seventh classes of a typical secondary school.

Disciplina	5.ª Classe	7.ª Classe
Portuguese language and literature	4	4
Latin	4	4
French	2	0
English	1	0
German	1	1
Geography	1	1
History	2	3
Mathematics	4	4
Natural and physical science	4	5
Philosophy	0	2
Drawing	2	0
Total	28	29

The executive head of a lyceum is the rector, who is appointed by the government from the professors of secondary education. He directs all the internal affairs of the institution and reports directly to the minister. The professors are appointed by the government upon the results of a competitive examination. The candidate must have the diploma of a secondary school or of a university. The appointments are for life unless forfeited by inefficiency or improper conduct. In case of his removal the professor may appeal to the superior council. The annual salaries in the central lyceums are for rectors, \$500; for professors, \$600, in the national schools, \$400 and \$500, respectively.

Higher Education.—Provision for higher education is made by special schools and the University of Coimbra. The former comprise three schools of medicine, three of pharmacy, and a college of letters at Lisbon. Since the Republic was declared, the government has decreed the establishment of three additional universities, which, however, have not yet been organized. The University of Coimbra comprises four faculties (theology having recently been abolished) and in 1910-1911 registered 1352 students. A faculty of letters (*Cursus superior de Letras*) was established in Lisbon in 1858 and was reorganized in 1901. In 1910 this was combined with the Escola Polytechnica (f. 1837) and the Escola Medico-Chirurgia (f. 1556) into the University of Lisbon with faculties of arts, science, and medicine, and a school of pharmacy. It has a valuable library and laboratory equipments and receives an annual appropriation from the legislature which for 1911-1912 amounted to \$170,607.

Technical Education.—The educational re-

PORTUGAL

form inaugurated by the Marquis of Pombal included provision for technical education, and the interest has never since entirely declined. The department is in charge of the Minister of Public Works assisted by a special council. The principal technical institution in the country is the Industrial and Commercial Institute of Lisbon; there are also a number of local industrial and commercial schools well sustained and equipped for the specialties to which they pertain. The important school of art at Lisbon receives a governmental grant amounting to \$15,800 annually; a school of art at Oporto is also subsidized.

In accordance with a financial law of 1907, there is an annual appropriation equivalent to \$100,000 for scholarships which are awarded to professors and students appointed to pursue studies and researches in the chief centers of technical education in Europe. By this means the government seeks to correct the excessive regard for literary and speculative studies characteristic of the educated classes in the kingdom.

Recent Movements.—In October, 1910, Portugal was declared a Republic; as a consequence of the revolutionary condition which attended this change, progress in education halted. By the separation of Church and State and the expulsion of the Jesuits under the new government, the chief agencies of education have been either crippled or destroyed; hence it may be said that education has now to be reorganized in the Republic. The work has already begun in the university which has been the subject of several orders directed mainly to the improvement of the medical course. The requirements for admission to that faculty, especially in the chemical and biological sciences, have been increased and the laboratory facilities extended. The expenditure for public education in 1910 was 3,712,509 milreis (\$4,041,074), not including 480,806 milreis granted to the industries of war and marine for the technical schools pertaining to their services.

POSEN ROYAL ACADEMY, POSEN, PRUSSIA. — Established in 1903 to promote German intellectual life in the province of Posen and West Prussia through the medium of teaching and scientific research. Two years earlier the efforts to raise the intellectual life of the provinces had resulted in the formation of a German Society for Art and Sciences, which cooperates with the Academy by arranging for public lectures delivered by instructors of the Academy in all sections of the province. Until 1910 the courses of the Academy were given in various city institutions, but in January of that year a splendid group of buildings was completed for the Academy. It began its activity with thirteen professors, four docents, and twelve lecturers, and there have been no important numerical changes in the teaching staff since then. The rector is chosen for a term of three years, the first incumbent having been Professor Eugen Kühnemann, former exchange professor at Harvard and the first incumbent of the Carl Schurz chair at the University of Wisconsin (1912-1913). Theology is not represented in the curriculum of the Academy, and the study of medicine is confined largely to hygiene and physiology (in connection with the Hygienic Institute). Both public and private law are represented, but the chief emphasis is placed upon the subjects usually comprised in the German faculty of philosophy, including political science and pure science, although only a few disciplines of the last-mentioned group are provided for. A limited amount of university credit is allowed on certain subjects, the expansion of the Academy into a full-fledged university having been proposed several times. Extension courses (*Fortbildungskurse*) are also offered by the Academy. The budget amounts

POSITIVISM

to about \$35,000 annually, and there are approximately 1000 students in attendance during the winter semester, of whom about 30 per cent are women. Aside from a number of departmental libraries, the Academy is dependent upon the Kaiser Wilhelm Library of the province, which contains over 200,000 volumes, as well as a travelling library of over 20,000 volumes intended for circulation in the entire province. The city of Posen also contains a Royal Hygienic Institute, founded in 1899; the Kaiser Friedrich Museum, founded in 1891, and the Royal State Archives. R. T. JR.

POSITION OF CHILDREN IN SCHOOL-ROOM — See SCHOOL MANAGEMENT, also DESKS AND SEATING.

POSITIVE NUMBERS. — See NEGATIVE NUMBERS

POSITIVISM — A philosophic term derived from the French term *positif*, whose connotation is quite different from that of the corresponding English adjective. In its most general sense positivism means a philosophic theory which does not recognize any facts or principles save those known and verified by the methods of the mathematical and physical sciences. A strict positivistic philosophy thus confines its assertions to the relations of co-existence and sequence that are ascertained to exist among natural events, and is agnostic as to any realities, whether conceived as substances or forces, which lie behind or beyond these natural events and their spatial and temporal relations. Positivism is used more specifically to denote the philosophy of August Comte (q.v.), who combined a philosophy of history and society, and a social and religious ideal with a scientific agnosticism.

According to his view of history, mankind passes through three stages of intellectual development, these stages controlling the accompanying phases of life. The first is the theological, in which events are explained on an animistic basis in the broad sense of that term. Events are explained by reference to personal volitions and emotions of non-human beings. In the second, or metaphysical, stage forces are substituted for these personal beings, monotheism being the transition point. The metaphysical stage culminates in the idea of Nature as the ultimate and unifying force. Then comes the positivistic stage, when men content themselves with trying to ascertain accurately the facts and events of the space and time world as that shows itself to sense perception. The intellectual development is paralleled by a social-religious development. The theological

POSITIVISM

stage, although most inadequate intellectually, was highly favorable to social organization because of the emphasis it put upon powers akin to those of man. The metaphysical stage, with its emphasis upon impersonal abstract forces, was unfavorable to the nurture of intimate social relations. The association of individualism in the eighteenth century with the conception of Nature as the ultimate norm represented the logical outcome of the metaphysical stage. The problem of the present or scientific era is to combine the religious and social spirit of the theological age with the objective, impersonal, intellectual attitude ushered in by the metaphysical stage. The method of effecting this combination constitutes the constructive portion of Comte's Positivism.

Since we can know only the spatial and temporal associations of phenomena, we must surrender all hopes of any objective or ontological synthesis. Some kind of synthesis, however, is necessary in order to give mankind that unity of outlook, belief, and aim which is requisite for its own unified organization, and is necessary to supply the motive force of social devotion which religion supplied in the past. The solution is to make a "subjective synthesis," an organization of scientific knowledge from the standpoint of its bearing upon social life and in the interest of the unification of that life. This amounts practically to substituting "Humanity" for Divine Being and for Natural Forces as the ultimate standard of value and center of reference, recognizing, however, that Humanity is not an ontological reality, but an ideal, whose existence is capable of becoming more and more of a fact in the course of human history. To make Humanity an object of religious devotion and to construct a religion of humanity, modeled on the whole upon medieval Catholicism, were more or less logical consequences of this conception.

While Comte succeeded in organizing a church, with branches still maintained in France and England, to represent his ideas and inaugurate his new religious scheme, his chief influence has been in general conceptions which have deeply affected the thinking of those who would not term themselves Comtians or even Positivists. That natural science does not itself tend to the promotion of social organization and welfare; that scientific specialization by itself is likely to be disintegrative; that modern life is sorely in need of a method such as was supplied by the religions of the past for bringing knowledge into connection with practice and conduct; that the ultimate purpose of science must be predilection of the future and social control,—are ideas that Comte developed with great power and that have become deeply engrained in contemporary culture. J. D.

POSTGRADUATE. — A term in common use in the United States to indicate university as distinguished from college students; that is, a postgraduate is the student who has taken the baccalaureate degree. The use of the term is due to the fact that American universities have, in most instances, grown out of undergraduate colleges and that the two institutions yet exist in almost every instance under the same management.

POTTER, ALONZO (1800-1868). — American bishop and educational writer; graduated from Union College in 1818. He was a tutor and professor at Union College for six years and then engaged in the work of the ministry. In 1832 he returned to Union College as professor of moral and intellectual philosophy, and as vice-president of the college. He resigned his position in 1845 to become Bishop of Pennsylvania. His educational writings include *Political Economy* (1840), *Principles of Science applied to Domestic and Mechanic Arts and to Manufacture* (1841), joint author with George B. Emerson (*q.v.*) of a popular teachers' book entitled *The School and Schoolmaster* (1842), and *Handbook for Readers* (1843). W. B. M.

POTTERY WORK IN THE SCHOOLS. — Education in Clay and Ceramics. — The unique property of plasticity as possessed by

moist clay appeals strongly to the pupils. Even in elementary work the reality of expression rendered possible by solid form affords a satisfaction which is lacking in a mere outline. The pupil is enabled to think in three dimensions and actually to produce the object conceived. Imitative modeling is not necessary as an introduction; the work may be creative from the beginning. The child may be taught to produce common articles of which the use is well understood. The simple cylindrical form of a drinking mug affords a good exercise in manipulation, and the control of the material is learned. In the early work tools are unnecessary, or may be of the very simplest character. In the higher grades there is no difficulty in planning progressive exercises. At first the forms are made more complex. Candlesticks, small jugs, bowls, trays, and tiles readily suggest themselves. Then simple decorations are applied by an incised line or groove. This is followed by an embossed design produced by depressing the background, and eventually use may be made of raised lines applied by laying on liquid clay with a brush, and in all there is a possibility of added color either in the clay itself or as a pigment. The recent developments in portable kilns with kerosene fuel make it possible actually to burn the pottery in the school and to add an appropriate glaze. This renders the pottery permanent and useful.

In several states provision has been made for education in practical clay working upon a large scale. The ceramic industries include not only pottery, but brick, tile, terra cotta, sewer pipe, droproofing, insulators, glass, cement, and enameled for steel and iron. Education in these several fields embraces a comprehensive study of chemistry, physics, geology, and the general engineering subjects, besides the special technology of clays, glasses, and glazes, and the reactions which take place at high temperatures. Students entering the ceramic schools are expected to be prepared for college, and the work throughout is pursued upon a collegiate basis.

Germany was the pioneer in ceramic research and training, the first important work having been done by Herr Professor Hermann Seger, who in 1800 decided to devote himself to the study of ceramics. Prior to this the manufacturer of clay wares had to depend upon empirical knowledge. There are now two important ceramic schools, one at Ditzlau, under Dr. Wilhelm Pukall, the other at Hôhr, under Dr. E. Dordel. In America the beginning was made by Professor Edward Orton, Jr., who in 1893 began an agitation for the establishment of special training in ceramic science, with the result that in 1894 the first American ceramic school was opened at the Ohio State University. Other schools and departments of ceramics have been established at Alfred University, Alfred, N.Y.; Rutgers College,

New Brunswick, N.J.; Illinois State University, Champaign, Ill.; Ames College, Ia.; the University of North Dakota; and Tulane University, New Orleans, La. Ceramic instruction as applied to school work and the individual production of pottery is given at the Mechanics Institute, Rochester, N.Y.; Teachers College, Columbia University, New York City; the Technical High School, Cleveland, Ohio; University City, St. Louis, Mo.; the Bradley Polytechnic Institute, Peoria, Ill.; the School of Education, University of Chicago, Ill.; the School of Industrial Art, Philadelphia; the Maryland Institute, Baltimore, Md.; the Handicraft Guild, Minneapolis, Minn.; the School of Industrial Arts, Trenton, N.J. The American Ceramic Society was founded in 1899.

In England an attempt was made as early as 1887 by the City and Guild of London Institute by offering annual examinations in the technology of pottery making. This movement has since developed into the establishment of a pottery laboratory in the heart of the Staffordshire Potteries under the charge of Dr. J. W. Mellor. The English Ceramic Society was founded in 1901.

POUNDS, JOHN (1700-1839).—A cobbler of Portsmouth, England, who originated the system of ragged schools. Crippled for life by an accident in 1781, he took up the trade of a shoemaker. In 1818 he was given charge of a nephew, aged five, and to find companions for him he invited other children. Stimulated by his love for children and a natural teaching ability, he undertook their

POVERTY SCHOOLS

education and increased their number to thirty or forty at a time, choosing the poorest and the outcast from the streets of Portsmouth. He taught reading, sometimes from handbills, and arithmetic, and instructed his pupils in cooking, mending shoes, and making their toys. His life generally was signalized by broad humanity and sympathy, which he found many opportunities of manifesting practically. By 1830, the year of his death, he had taught about 500 pupils. Many ragged schools (*q.v.*) were established in England and Scotland, influenced by the example of John Pounds.

See CARPENTER, MARY; GUTHRIE, THOMAS; REFORM SCHOOLS, section on Industrial Schools of England.

POVERTY SCHOOLS — See RAGGED SCHOOLS.

POWELL, WILLIAM BRAMWELL (1810-1904). — City superintendent of schools; was educated in the public schools of Illinois, at Wheaton Academy, and at Lombard University. He was for two years principal of the schools at Hennepin, Ill.; eight years superintendent of the schools at Peru, Ill.; sixteen years superintendent of schools at Aurora, Ill.; and fifteen years superintendent of the schools at Washington, D.C. His publications include *How to See* (1880), *How to Talk* (1880), *How to Write* (1880), *History of the United States for Beginners* (1890), a series of school readers, and numerous articles in educational journals and the proceedings of educational associations. W. B. M.

POWER — In current arithmetics there is often a chapter on powers and roots, the power of a number meaning the result of taking the number a certain number of times as a factor. This is the primitive use of the term, and is found in the Greek as *dekapot*, from which we have such words as dynamite, dynamo, and dynamite. The Greeks used the word, however, to mean the second power, or square. Diophantus (*q.v.*) used it to mean the second power of the unknown quantity, or, as we would write it, x^2 . For higher powers Diophantus used *zēstos*, *dyapostrotos*, *terapostrotos*, and so on. The early Italian algebraists used *quadro* for the second power, and also *cassa*, with other special names, for higher powers. In the seventeenth century the fractional exponent already suggested by Oresme (*q.v.*) and the negative exponent came into general use. This led to the broadening of the concept of power to include other than integral powers. The primitive definition now ceases to hold, and, with a broadening of the definition, it becomes proper to speak of fractional, negative, complex, or transcendental powers. In modern education this broader use of the term is coming to be generally recognized, and sanction is being given to such expressions as "a to the one-

half power," "a to the minus third power," and so on. D. E. S.

POWIS, LORD. — See PARLIAMENTARY COMMISSIONS.

PRACTICE — See FORMAL DISCIPLINE; HABIT; SCHOOL MANAGEMENT.

PRACTICE CURVE — A curve representing the result of practice in which the height of the various points in the curve above a base line represents the amount of performance and the horizontal distances from the beginnings of the curve represent the number of repetitions of the activity. Repetition of a mental performance is attended by more or less improvement in the capacity for performance. Practice curves have been obtained in the performance of acts requiring different degrees of mental attention. Thus Figure 1 represents

FIG. 1

a practice curve characteristic of the "trial and error" method in the case of the successive attempts of a cat to escape from a cage by turning a button on the door of the cage. Figure 2 represents a human practice curve in

FIG. 2

learning by the trial and error method, where the subject traced the diagram shown in the upper right-hand corner of the figure, the diagram and the hand being seen only in a mirror. The lowering of the curves indicates improvement. The upper curve shows the effect of practice in shortening the time taken

PRACTICE CURVE

to trace the drawings; the lower represents the progress of the learning process in terms of the number of errors made. The curves also show periods in which practically no progress takes place (plateau periods), which must be

FIG. 3.

taken as representative of points at which assimilation is taking place, since they are followed by periods of rapid progress. This feature is even more strikingly shown by the curves of Figure 3, showing the progress made in the learning of telegraphy. The upper curve represents the improvement in sending messages, rapid at first and then gradually lessening, until the limit of the effect of practice

FIG. 4.

is reached. The lower curve represents improvement in the ability to receive messages, which follows an entirely different course from that of sending. The two lower curves in Figure 4 show the progress of the formation of habits of a relatively low order; namely, receiving separate letters and words. Both these activities improved rapidly for a time,

FIG. 5.—A typical curve of learning. The curve is not typical in one respect, since it does not show the fluctuations of efficiency which always appears; but is intended to show the general increase (rise) of efficiency with continued repetition of the performance. Horizontal distances denote the time spent in learning, and vertical distances the measure of efficiency.

PRAGMATISM

finally reaching a maximum in a similar fashion to the relatively simple process of sending. The effect of practice upon the memorizing of a series of nonsense syllables is represented in Figure 5, where the progress is very rapid at first, then more gradual, finally reaching a point at which perfection is possible.

PRACTICE LESSONS.—See TEACHERS, TRAINING OF.

PRACTICE SCHOOL.—A school of elementary or secondary grade maintained as a laboratory in connection with a normal school or teachers' college for the purpose of providing students of education or apprentices in teaching with opportunity for schoolroom management and teaching. Frequently the same laboratory school serves the purposes of a demonstration (observation or model) and an experimental school. Such a school may be specially organized for its particular purpose, or may be a school in the regular school system assigned to this function.

PRAGMATISM.—The conception (though not the word) pragmatism was first proposed by the American mathematician and logician, C. S. Pierce, in an article published in 1870 in the *Popular Scientific Monthly*, upon "How to Make Our Ideas Clear." The gist of the notion is that the meaning of any idea or conception lies in the consequences that flow from an existence having the meaning in question, so that the way to get a clear conception is

to consider the differences that would be made if the idea were true or valid. In conversation Mr. Pierce used the term "pragmatism" to designate this view of the nature of conceptual meanings. Some twenty years afterwards William James proposed the use of this idea as a test of the meaning and worth of specifically philosophic conceptions. He argued that the point of any philosophic doctrine or issue lies in the particular differences that would follow if the idea in question were true, and that if no differences can be made out, the doctrine or issue is wholly verbal. This theory is strictly a method for determining the meaning of concepts; it is not a theory of their truth nor of their relation to existence. Pragmatism in this narrower sense, Mr. Pierce has since wished to call Pragmaticism, to differentiate it from a later extension which Mr. James and others gave the doctrine.

In his *Psychology* and his *Will to Believe*, James had pointed out the influence of interest, choice, and emotional factors upon our beliefs and had made a plea for the recognition of the validity of these factors under certain circumstances. Schiller of Oxford devoted himself to a reform of logic in the direction of greater concreteness and usefulness through recognition of the part played in thinking by emotional and volitional factors, and generalized the underlying idea into the theory that all knowledge is purposive or teleological. This view James adopted as part of the pragmatic conception. Since interest, choice, and effort are involved in knowledge, knowledge is essentially experimental and in constant process of making. Since, by common consent, truth is the goal in which knowledge proper terminates, it follows that truth is not something antecedent to our intelligent activities, but something following upon them and produced by them. Since truth involves the relation of objects to thought, this making of truth logically implies a making of reality. So, by a natural extension, pragmatism was widened from a theory of the purposive character of knowledge and a theory of truth as the successful working out of knowledge, to the theory that reality itself is plastic and is in course of construction through the cognitive efforts of man. This aspect of pragmatism, Schiller called Humanism.

In his *Psychology*, James had suggested, and to some extent used, the idea that intelligence, or man's knowing power, evolved as an instrument of adaptive response to stimuli, lying between sensory stimuli and motor response. Dewey and others took up this suggestion, and developed on the psychological side the idea that thinking or reflective attention is the counterpart and complement of habit. Habit expresses the mode of response to old and well-established stimuli, thinking to stimuli where novelty and a doubtful or precarious factor are marked features. This conception was

also more or less systematically applied to a reconstruction of traditional logical theory. Logic was treated as a systematized account of the procedures of thinking in adapting beings living in a social environment to the control of novel and uncertain features of existence, these features being treated as possessed of objective character. On the moral side, the notion was extended to the theory that standards and ideals are not fixed and *a priori*, but are in a constant process of hypothetical construction and of testing through application to the control of particular situations. This general logical and ethical view, known specifically as instrumentalism, was also adopted by James as a part of pragmatism in its wider sense.

It is generally admitted that pragmatism, while still in a formative state, has exercised an influence as a philosophic ferment out of proportion to the number who have definitively accepted it. It falls in line with the growing influence of the theory of evolution, asserting that reality itself is inherently and not merely accidentally and externally in process of continuous transition and transformation, and it connects the theory of knowledge and of logic with this basic fact. It connects with historic spiritual philosophies in its emphasis upon life, and upon biological and dynamic conceptions as more fundamental than purely physical and mathematical ideas. While claiming to be strictly empirical in method, it gives to thought and thought relations (universally) a primary and constructive function which sensational empiricism denied them, and thus claims to have included and explained the factor that historic rationalisms have stood for. In somewhat similar fashion, it claims to mediate between realistic and idealistic theories of knowledge. It holds to reality, prior to cognitive operations and not constructed by these operations, to which knowing, in order to be successful, must adapt itself. In so far, it is realistic in tendency, and pragmatism is usually recognized to have been an influential factor in calling out the reaction against the Kantian and Neo-Kantian idealisms dominant upon its first appearance. But it does not hold that the adaptation of intelligence to existence is a matter of literal conformity or sheer reproduction by way of copying, but rather that it is an adaptation in the interest of a further evolution of life in complexity and richness of meaning. Hence it claims to recognize and include the verifiable facts as to the rôle of thought in the world which have given rise to the idealistic exaggeration. Although the issue as to the future of pragmatism is still pending, the present writer may be pardoned for calling attention to its advantages as a working hypothesis in educational theory. In its conception of knowledge as a present living process (not a collection of static results) and its conception of knowledge as having a concrete purpose to fulfill in situations of practical experience (not

something existing complete in itself in a purely theoretical region) it adopts and tries to justify the position which any one must of necessity assume in his endeavor to develop intelligence and make knowledge a vital factor in character and conduct. J. D.

PRAGUE, CHARLES-FERDINAND UNIVERSITY OF.—The oldest institution of higher learning within the confines of the old Holy Roman Empire of the German nation. It was established in 1348 by Emperor Charles IV and received the papal sanction from Clement VI. Prior to this time Germans in search of a university education had been compelled to go to France or Italy, and they were destined soon to encounter difficulties in their own institution. The strong German influence that had made itself felt in Bohemia in the first half of the fourteenth century was followed by a Czech reaction, which culminated in a decree of Jan. 18, 1409, in accordance with which the administrative control passed from German into Czech hands; the Bohemians were in future to be given three votes, as against the single vote of the other three nations (Bavarians, Saxons, and Poles) combined. This resulted in an exodus of the German students and in the establishment of the University of Leipzig (q.v.). Before this defection the university boasted of an enrollment of over 2000 students. It had been established

in accordance with the medieval custom as a corporation of four guilds, i.e. the traditional four faculties of theology, law, medicine, and liberal arts, the University of Paris serving as a model and the Archbishop of Prague acting as Chancellor. The emigration of the German students was followed by a series of religious conflicts, and as a result of these two factors a period of decline set in. Ferdinand I, therefore, called the Jesuits to Prague and turned over to them the Dominican Monastery of St. Clement, where a Catholic academy with a theological and a philosophical faculty was organized. During the first half of the seventeenth century the Jesuits were driven out of Prague on two separate occasions, but after the Thirty Years' War (in 1653) the Jesuit academy was combined with what remained of the secular institution into a single university, the Karolo-Ferdinandine, by Ferdinand III. Various reforms were introduced during the reigns of the Empress Maria Theresa (q.v.) and of Emperor Joseph II, in the second half of the eighteenth century, and German was made the language of instruction. In 1849 a thorough reorganization of the methods of instruction took place, and in 1882 a partition into a German and a Czech university was effected. In 1848 permission had been granted to deliver lectures in the Czech language, and the German party feared that unless a separation were brought about, the Czech element would gain absolute control. There are thus two separate and distinct universities, known officially as the Imperial-Royal German Charles-Ferdinand University, and the Imperial-Royal Czech Charles-Ferdinand University, the German language being the exclusive medium of instruction in the former, and Bohemian in the latter. Each of the two institutions has its own buildings and its own administration, while the library is independent and is used jointly by both universities. The Czech faculties of law and philosophy were organized in 1882, that of medicine in the following year, and that of theology in 1891, the latter as well as the theological faculty of the German university being Catholic. During the winter semester of 1910-1911 there were 1657 students in attendance on the German university, of whom more than half were enrolled in the faculty of law; there were also 287 auditors registered. The teaching staff of the German university comprises about 175, that of the Bohemian university over 200 teachers. The latter had 1432 students in attendance in the winter semester of 1910-1911, of whom almost 2000 were enrolled in the faculty of law, over 1500 in philosophy, and 800 in medicine. The annual budget of the German university amounts to about \$335,000, that of the Bohemian university to about \$385,000. The public and university library, established in 1773, contains 400,000 volumes, 4000 volumes of manuscripts, over 1500 in-

PRATT INSTITUTE

cunabula, 20,000 engravings, 1700 volumes of documents, etc. Both institutions maintain a comprehensive group of medical institutes and clinics.

Prague was the first city in Germany or Austria to establish a technical school, namely in 1800, the institute having been organized on the model of the *Ecole polytechnique* of Paris. For the first nine years students were matriculated through the philosophical faculty of the university, but in 1815 the institution was placed on an independent basis, a complete reorganization having taken place in 1829-1832. The bipartition into a German and a Bohemian school took place in 1868. The former had 1905 students and 225 instructors in the winter semester of 1911-1912, the latter 411 students and over 210 instructors.

Prague also contains several valuable public and private libraries, as well as several archives and museums, among which special mention must be made of the Bohemian National Museum, founded in 1818, and including a library of 265,000 volumes, 6300 manuscripts, 77,000 engravings and photographs, etc.

PRATT INSTITUTE, BROOKLYN, N. Y.

—An institution established in 1887 by Charles Pratt, to promote industrial education, to inculcate habits of industry and thrift, to foster all that makes for better living. It aims further to conduct its courses in such a way as to emphasize the application of art and science to industry and to give to every student practical skill along some one line of work. It consists of five schools, fine and applied arts, household science and arts, science and technology, kindergarten training, and library science, — giving twenty-four full-time day courses two years in length, including three courses for the training of teachers. In addition, there are thirty-two complete evening courses, a large number of part-time day courses, and Saturday morning classes. Diplomas are awarded for the satisfactory completion of the normal courses, and certificates for the other full-time courses, but no degrees are conferred. The Institute has also a free public library of 100,000 volumes, a gymnasium, a men's club, and a bathhouse for the care of students when ill or indisposed. It occupies in all twelve buildings. It has 150 instructors and an average annual enrollment of 3500 students. It has a permanent endowment fund of \$4,850,000, and buildings and grounds valued at \$1,600,000.

PRECENTOR — See SONG SCHOOL under MIDDLE AGES, EDUCATION IN.

PRECEPTORIAL SYSTEM — See also TUTORIAL SYSTEM; PREFECT AND THE PREFECTURAL SYSTEM; PRINCETON UNIVERSITY.

PRECEPTORS, COLLEGE OF — An association founded in 1846 and granted the Royal Charter in 1849 "for the purpose of promoting sound learning and of advancing the interests of education, especially among the middle classes, by affording facilities to the teacher for acquiring a knowledge of his profession," etc. The College was also empowered to establish lectureships in education and to do whatever is "calculated to advance the cause of education or the interests of the scholastic profession, particularly in England and Wales." To attain these ends the College instituted examinations for pupils in secondary schools and for teachers. Diplomas and certificates are granted as the result of the examinations. For teachers the examinations are conducted in three grades (associateship, licentiate'ship, and fellows'hip) and all include the theory and practice of education. The College was a pioneer in the training of teachers for secondary schools. Indirectly the school examinations, instituted successfully in 1853, served to establish standards and guide teachers, in 1861 an unsuccessful attempt was made to establish a series of lectures in education, in 1867 the first examination in the theory and practice of education was conducted, in 1871 a successful series of lectures on education was introduced; and in 1873 the first professorship in education in England was established by the College. (See EDUCATION, ACADEMIC STUDY OF.) In 1895 a Day Training College for Secondary Teachers was established, but was discontinued in 1898. In addition to the theoretical written examination, the College also holds practical examinations for certificates of ability to teach. Winter meetings and short courses for teachers are also conducted.

Since 1853 examinations have been conducted for pupils in secondary school subjects. An examination had already been held in 1850. There are three grades of examinations: third class or lower, second or junior, and first class or senior. Certificates and prizes are awarded on the results. In addition to the certificate examinations, the College also conducts an examination for lower forms, but since by a Board of Education regulation pupils under fifteen in grant-earning secondary schools are not allowed to take an external examination, the activity of the College in this direction is limited. Many schools make use

PRECOCITY

of the marks obtained in the College of Preceptors for purposes of promotion, etc. Besides the school examination there is a Professional Preliminary Examination conducted at local centers; the certificate obtained on this examination is recognized by the Board of Education and a large number of professional associations. The College also has power to inspect schools with reference to (a) the suitability of the school premises; (b) the adequacy of the teaching staff; (c) the sufficiency of the apparatus and appliances for teaching; and (d) the organization of the school.

Membership in the College of Preceptors is open to all persons over eighteen years of age engaged in education, who have passed an examination satisfactory to the Council, but subject to election by the Council. The College, which is located in Bloomsbury Square, London, possesses a library of 10,000 volumes and a common room and reference library for the use of members. Meetings are held once a month for the reading and discussion of papers on educational topics. The organ of the College is the *Educational Times*, one of the oldest educational journals in England.

PRECOCITY. — See PRODIGY.

PREDISPOSITION — Inherited tendency or capacity for acting in a certain manner. The term is thus opposed to habit, which is acquired activity. In a broader sense the term is used to include inherited physical tendencies, as well as mental.

Its relation to temperament, i.e. sum total of dispositions and predispositions, is a problem revolving itself into that of the relative influence of heredity and environment.

Among the predispositions which have figured largely in the literature of the subject are innate ideas (q.v.). The doctrine of innate ideas held that the intellect finds itself at birth in possession of certain primary conceptions. In its more refined form this doctrine holds that the human intellect has certain capacities at birth which impel it, under the influence of experience, to certain conceptions and judgments. See HENRICH. E. H. C.

PREFECT AND THE PREFECTURAL SYSTEM — Prefects (Winchester, Charterhouse, Marlborough, Bradfield, and the majority of the public schools), prepositors (Eton,

PREFECT

Rugby), monitors (Westminster, Harrow, and some other schools), are older boys invested by the headmaster with specific authority over, and power of enforcing their authority by personal chastisement of the younger boys in a school. The prefect or monitorial system of self-government of boys by boys, in the life out of school hours is often put forward as the essence of the Public School (q.v.) of England and the peculiar virtue of the English public school system. With inexcusable ignorance of the history of schools, the creation of this system, or at least its vogue, is often attributed to Dr. Arnold (q.v.) when Headmaster of Rugby (q.v.). A more conspicuous instance of putting the cart before the horse would be difficult to find.

The truth is that the system is of immemorial antiquity, and can be traced not only to the foundation statutes of Winchester College, at the end of the fourteenth century, but is found in the only full series of school statutes which are extant to us before that, — in the new statutes of St. Alban's School made in 1309; while the Winchester statute is a direct repetition of provisions in the statutes of Merton College, the oldest university college at Oxford, made in 1274. In essence the prefect system is connected with the pupil-teacher system, which prevailed at a very early time.

In the earliest curricula of Winchester and Eton which have come down to us (in 1530) the pupil-teacher system appears in full vogue, the Vth form getting its verse rules from the Vth and giving its grammatical rules to the Vth, and so on. At Winchester the system of pupils acting as tutors to juniors and seeing that they did their verse and prose tasks, and helping them to do them, prevailed certainly down to 1850. The task of teaching carried with it the prerogative of correcting, inasmuch that it was a matter of solemn discussion in canon law treatises whether, if a son taught his father, the right of correction which the father possessed by the law of nature over the son did not yield to the right of the master to correct the pupil, a right the special grant of which over Heloise by her uncle to her tutor Abelard was a main cause of their tragic love story.

Now in the statutes of Merton College, in which it must be remembered the junior fellows or scholars, as they are called, were boys or little more than boys, while thirteen were to be grammar school boys before being admitted scholars, it was provided by chapter seven 'Of the office of the Dean' that "some of the more discreet of the aforesaid scholars shall be elected to take charge, under the Warden and as his assistants, of the less advanced as to their progress in learning and as to the uprightness of their behavior; so that in every twenty, or, if necessary, ten" — whence the name of tuition tithing-man or dean — "one shall pre-also. Also in each chamber in which the scholars live there shall be one more mature than

PREFECT

the rest who shall superintend his companions, or fellows (*socii*) and report to the Warden and the rest of the præpositors (*prefecti* in *hujus modi cura præpositus*) and to the whole body of scholars themselves, if necessary."

The statutes of St. Alban's School in 1309 appear to show elder scholars already acting as agents and magistrates themselves. These statutes were solemnly made by the master of the school as Ordinary Judge of the school in the presence of a notary public of the Holy Roman Church and Empire, and are given out not as legislative innovations but as writing down established customary law. They are to be made by the master and bachelors, much as at Oxford statutes were made by the Chancellor and masters, or by a mayor and citizens. The usual punishment denounced for offenses was excommunication by the Master, the secular arm being invoked if necessary to execute the offender's goods; or canonical correction, i.e. flogging by the master.

The undermaster appears to be called the *ostiarius*, doorkeeper or usher, as he was at Winchester. But there was also an under-*ostiarius* (*vice*). The *ostiarius* or under-*ostiarius* was always to sit by the door, and never to allow more than two or three scholars to go out of school at the same time. If they did not execute their duty, the master corrected them. If a scholar in the school, or outside, struck another scholar or was guilty of an outbreak (*rabundus delinqueret*) or made a great noise, his hood was to be taken by the *ostiarius* and he was presented to the vice-monitor and chastised by him. Whether the vice-monitor was a boy or an undermaster is not clear. But there was an order of bachelors in the school, who might either be bachelors in a university or might be created by the master after examination in the school, their ability being tested by composition of Latin verse or prose or a rhyme, and public disputation in grammar. If any one assaulted the master himself, not only was he to be excommunicated but he was "while under excommunication to receive salutary discipline in the school from all the bachelors." Here then the bachelors seem to be prefects, wielding the *baculus* or stick, the "ground-ash" of the Winchester prefects, and "lunding" the offender, or "lunding" as it is called at Westminster. Moreover, the master appointed two of these bachelors to take care of St. Nicholas' chest, in which were deposited the precious and expensive wax candles which burned before the image of St. Nicholas, here as elsewhere the patron saint of schoolboys, and the miter and episcopal staff or crozier used in the celebration of the boy-bishop (*q. r.*) who dressed up as St. Nicholas and performed service on his day, December 6. It is also was kept the Great Priscian, the large grammar in twelve books, which was the standard authority and presumably referred

PREFECT

to for settling disputed points. So here we have the prefects exercising administrative powers, as in later times the Prefect of Tub at Winchester superintended the deposit of the broken meats from dinner in the tub standing in the middle of the hall for distribution among the poor; and as late as 1805, and perhaps still, providing for the baize linings of the doors and other necessities in school.

It is certainly improbable that the prefect system was confined to English schools. We get in Buchanan's proposals (1509) for the College of Humanity or Grammar School at St. Andrews, founded on the model of Strasbourg and Geneva academies, references to Decurions, who were to note defaults and especially not speaking Latin, which appears to show that something like the prefect system flourished in foreign schools also. But there have been such violent convulsions of schools abroad that their continuity has not been preserved to the same extent. Moreover, self-government has always been more advanced in England than on the Continent of Europe from the time of Edward I. onward, and it is natural that schools should reproduce the system of the state and nation. It is certain that in England the prefect system was ubiquitous and not confined only to the great public schools, though naturally it is from them that the documentary evidence is most ample and the widely proclaimed tradition is most vocal. Such instances as the statutes of Giggleswick School, a relatively small school in Yorkshire, made in June, 1502, and the Hertford Grammar School statutes in 1617, bear evidence that the smaller schools were governed on the same system. Rules in the former provide that "What scolar or scollers who in the absence of the master and usher shall not obey the two prepositors by the master appointed for the order and quietness of the said scholl shall for every offence proved be subject to the severer censure of the said master or usher." At Hertford "all scholars on the usher's side shall speak Latin altogether, and for the observing thereof the master to take such course as usual in schools by custos, monitor or otherwise." That in times when manners were rough and when the system of flogging (*q. r.*) began to be ingrafted on the prefect system, the prefectural power was sometimes or even often abused and much misery caused thereby, there can be no doubt. But oppression of the weak by the strong is incident to all systems, and much worse where there is no system. No abuse of a prefect system could be so bad as the abuse of the usher system, the system of espionage by undermasters, characteristic of the Jesuit schools and said to be even now prevalent in schools in France, except in the most recent schools based on the English model. Effective protests by rebellion against the abuse of prefect power are on record in the late eighteenth and early nineteenth centuries

PREMIUMS

at Winchester and Rugby. With modern and more democratic ideas in the state, the prefect system has been modified in the schools, especially in the element of punishment. Eltonians sometimes write as if it did not now prevail at Elton because their Prefectors are now nearly formal officials as such. But the powers of "Pop" and of seniors in houses and the like are not perhaps wholly well regulated substitutes for them. Any one who has had experience of the prefect system as now in vogue at Winchester or Harrow, and who sees what the absence of such a system can produce in *Stalky and Co.*, or in certain French schools, cannot but feel thankful that the provisions of William of Wykeham still set the fashion of self-government of boys by boys in English public schools. A. F. L.

PRESSBURG, ROYAL ACADEMY OF. — An institution which is located in the Hungarian city of that name (Pozsony) and consists of the faculties of law and political science and courses in philosophy. A high school was established

PRIDE

in Pressburg as early as 1443 by King Matthias Corvinus, who reestablished the University of Ofen (see BUDA-PEST) several years later. The Turkish invasion, which took place in the first half of the following century, soon put an end to the institution. In 1783 the University of Ofen was transferred to Pest, and a year later the Academy of Ofen was transferred to Pressburg. In 1910-1911 the Academy had an enrollment of about 2500 students, the teaching staff consisting of a dozen instructors. The library possesses about 25,000 volumes. Pressburg also contains an evangelic theological academy, founded in 1801, and the city archives, established as early as 1291. The Hungarian Minister of Education announced at the beginning of 1912 the introduction of a bill to raise the Academy to the status of a University to include a medical school. R. T. JR.

PRESSURE. — One of the cutaneous sensations. The pressure spots are scattered everywhere over the external skin and in the cavities of the mouth, nasal passages, etc. They range between 10 and 250 to the square centimeter, with an average according to Von Frey of about twenty-five. The skin between the pressure spots gives no sensation unless strongly stimulated, and then the pressure is assumed to be communicated to pressure spots in neighboring regions. The sense organs of pressure are said by Von Frey to be the nerves at the roots of the hairs, where there are hairs, and on the palms and soles of the feet, where hairs are lacking, to be the Meissner corpuscles. PREVIOUS EXAMINATION. The entrance examination of "little-go" at Cambridge University. All candidates must satisfy the examiners in Parts I and II. *Part I* includes: Greek Gospel (or an additional paper in Greek or Latin); Greek (translations of passages from prepared or unprepared books, with grammar questions); Latin (translations of passages from prepared or unprepared books, the latter for all candidates, use of a dictionary being allowed). *Part II* includes: Paley's *Evidences* (Elementary Logic) or elementary heat and chemistry; geometry, practical and theoretical; arithmetic; elementary algebra; English essay. Candidates for honors must satisfy the examiners in "additional" subjects; mechanics and the elements of trigonometry; French or German.

PRIESTLEY

PRIESTLEY, JOSEPH (1733-1804)
Nonconformist theologian and scientist born at Fiddishead in the West Riding of Yorkshire. He was educated at the Hatcher Grammar School and by a congregational minister from 1749 to 1755, owing to ill health, he was unable to attend any institution and studied philosophy and Arabic, Chaldean, and Hebrew, and also, with a view to a commercial life abroad, French, German, Italian, and mathematics. In 1752, however, he decided to enter the ministry, and joined the nonconformist academy at Huddersfield. In 1755 he was appointed minister at Widdham Market in Suffolk and three years later at Nantwich, where he opened a school. In 1761 he became tutor in classics at an academy in Warrington and in addition to the classics gave lectures in history, and carried on experiments in electricity which led to his appointment as fellow of the Royal Society in 1766. From 1767, when he was called to Mill Hill Chapel, Leeds, he devoted himself almost wholly to the study of theology and science, a field in which he achieved a reputation as the discoverer of oxygen and other gases. As literary companion of Lord Shelburne from 1772 to 1780 he had opportunities of visiting London and the Continent, where he came into touch with the leading scientists of the day. His excursions into politics when he was minister of the New Meeting at Birmingham brought him into great popular disfavor which expressed itself in the burning of his house, books, and apparatus. After a brief stay in London he migrated to America and settled at Northumberland, Pa. where he died in 1801. While preeminently a theologian and scientist, Priestley showed a great interest in education. His writings in this field were collected under the title *Miscellaneous Observations Relating to Education more especially as it Respects the Conduct of the Mind to which is added an Essay on a course of Liberal Education for Civil and Active Life* (Cork, 1780). Evidences of familiarity with the work of Rousseau and the subsequent naturalistic movement may be traced. At the same time the beginnings of the utilitarian tendency may be recognized in his educational writings, and it was from Priestley (*Essay on Government*) that Bentham borrowed the phrase "the greatest happiness of the greatest number." "The chief and proper object of education," according to Priestley, "is not to form a shining and popular character, but an useful one, useful according to the sphere in which a person lives." Hence he advocates a different type of education for each class in society, but "consistent character," "pursuit of truth," and the "practice of virtue" underlie each one. As for the classical studies, Priestley recognizes their importance but also insists that changed conditions require changes in plans of education, and that the vernacular is also valuable. In

PRIMER AND PRIMARIAN

his *Essay on a Course of Liberal Education for Civil and Active Life* Priestley advocates the study of history in general, the history of England, and the present constitution and laws as a general preparation for the ordinary citizen who is not to be a member of one of the learned professions. To this *Essay* he appends syllabuses on each of the courses which he himself gave at the Warrington Academy and which were recommended at Cambridge by John Symonds (1729-1807), professor of modern history. Priestley's educational work is of considerable interest in the history of English education, since it mirrors to a large extent not merely the personal bias of the scientist, but a theory of education formulated and put into practice in many of the nonconformist academies (q.v.).

PRIMARY GRADES -- The four grades extending from the first through the fourth elementary school years are the primary grades. When a school consists merely of the pupils belonging to the first five school years, all the grades included are frequently termed primary grades. In the broad meaning of the term, kindergarten classes are also included among the primary grades. H. N.

See GRAMMAR GRADES; ELEMENTARY SCHOOLS; GRADING AND PROMOTION.

PRIMARY GRADES AND THE KINDERGARTEN. See KINDERGARTEN.

PRIMARY SCHOOL -- A term now used somewhat generally in the United States to designate the first four years of the elementary school course. In some New England towns the term "intermediate school" is still used, and where this is the case the term "primary school" is then usually employed to designate only the first three school years.

See ELEMENTARY SCHOOLS.

PRIMER AND PRIMARIAN. -- It is disputed whether a primer owes its name to being a first or primary book on any subject, or to its being used at the first hour or *prime*, as the original primer for teaching Latin, or English, was a book of private devotions used at that hour. The chief objection to the latter derivation is that the devotional primer began with matins, which were supposed to be said at or before dawn, considerably before *prime* or the first hour at six o'clock. It has been claimed that the primer was the lay folk's prayer book. But Dr. Littlehales, who seems disposed to insist on the latter meaning,

by way of showing that the medieval church did not try to keep the lay folk in religious darkness, has practically disposed of the claim by showing that the primer was really derived from works of supererogation in the way of devotion by ninth century monks, who, having ceased more or less to perform manual labor, had to fill up their time somehow, and when especially zealous did it by additional services. However that may be, it is certain that the primer or book of devotions, once conceived, served as a schoolbook for young ecclesiastics, clerks, and schoolboys. The earliest use of the word *primer* appears to be found in a list of books in 1294 of Matthew of the Exchequer, "*unum Primarium.*" In 1323 a lady at Lincoln bequeaths a "primer which was my sister Margaret's." It was no doubt very early used as a schoolbook because it contained the most important of the psalms, the seven Penitentials, and the fifteen Graduals, and the Hours of Our Lady, the first object of every schoolboy's instruction in learning to read. But the first known definite proof of its being so used is in Chaucer's *Prioresse's Tale* — "This litel child his litel book-learnynge As he sat in the scole at his prymer." This was in a song school, where the child did not learn grammar. But in an Ipswich ordinance settled by the bishop of Norwich in 1477 we find three grades of scholars attending the grammar school and the "primarians" or those learning the primer amongst them. The grammar schoolmaster was directed to charge 10d a quarter for grammarians, 1d for psalterians, and only 6d. for primarians (*pro primario*). It is strange to find the distinction thus drawn between boys learning the psalter (*sallario*) and those learning the primer, which contained a large slice of the psalter. But there was a further distinction. The "Apeyses" (i.e. ABC's, those learning the alphabet only) and "Songs" (or those learning singing only) were excluded from the grammar schoolmaster's jurisdiction altogether and left no doubt to the song schoolmaster, who probably was not one but divers. This ordinance looks as if the primer by that time had become like the later primers mentioned by Sir Thomas More, and the Protestant hornbooks, which began with the graces before and after meat. Sir Thomas More complains that the Luthoran primers omitted these as superstitious. A reformed primer was set forth by Marshall in English in 1534. The diversity of primers was one of the points taken up by Henry VIII in his love of law and order and uniformity, and he set forth in 1505 a primer with the Pater Noster, Ave Maria, Credo, and Ten Commandments. In 1617 Edward VI set forth *Injunctions* to use no other primer, whether English or Latin, than that set forth by the King's authority, Winchester. The primer continued in use to the eighteenth century.

A. F. L.

New England Primer — The title of one of the most frequently published and most widely used books bearing the character both of a beginners' reading book and of a catechism, the book which "taught millions to read and not one to sin." It was a literal descendant of the *Primer* of the English Reformation (e.g. the *Reform Primer*, 1534; the *Goodly Prymer in Englyshe*, 1535; Henry VIII, the *Primer*). Many unauthorized editions appeared, especially in Scotland and Dublin. With these primers were in time combined the ABC books in one volume. In New England the number of catechisms multiplied rapidly after 1641 to such an extent that separatist tendencies rather than uniformity was encouraged. The immediate predecessor of the famous *New England Primer* was the *Protestant Tutor*, issued at some date before 1680 by Benjamin Harris, a London printer who was frequently in difficulties with the authorities and visited New England several times. A later edition of the *Protestant Tutor* included the alphabet, syllabarium, alphabet of lessons, the Lord's Prayer, the Creed and Ten Commandments, the poem of John Roger with the picture of his burning, the "figures and numerall letters," and the names of the books of the Bible. It was this work which Harris abridged with an increase in favor of the school work and published during a stay in Boston (between 1687 and 1690) under the famous title, the *New England Primer*. The earliest known fragments of this work were found in a book published by Wm. Bradford, in Philadelphia or New York between 1687 and 1700. The book met with instant success in both New England and Old England, where Harris published a new edition in 1701 under the title: the *New England Primer Enlarged; For the more easy attaining the true Reading of English To which is added the Milk for Babies*. The work was reprinted in England, Scotland, and America down to the nineteenth century, and in the changes which it underwent gives significant evidence of the development not only in theology but in the attitude to children and children's literature (*q.v.*). According to Mr. Ford "an over-conservative claim for it is to estimate an annual average sale of twenty thousand copies during a period of one hundred and fifty years, or total sales of three million copies." Its very popularity, however, seems to have militated against its preservation, for copies of the book are very rare; there is no copy of a seventeenth century edition and few of the eighteenth.

PRIMITIVE PEOPLES

HALLOW, H. V. *Forgotten Banks of the American Nursery*. (Boston, 1911.)

PRIMITIVE PEOPLES, EDUCATION AMONG — Anthropological treatises are commonly deficient in the information they convey regarding the primitive child, his nurture, training, and condition, amongst the lower races of mankind. It is often considered that the savage boy or girl receives little direct preparation for the duties and occupations of life. This, however, is by no means an accurate view of the matter. Many "nature-peoples" of to-day possess their own systems of instruction and discipline to which the term "education" may very properly be extended.

A complete study of primitive education would involve an examination of each separate people in relation to its particular environment — geographic, economic, and social. It would be necessary to show how in every case the educational system is definitely related to the special activities of the group in question. Within the compass of the present article no more can be done than to set forth certain general aspects of the subject which are measurably independent of local conditions, geographical situation, and the stage of culture attained by any given people.

Treatment of Children — In primitive society boys and girls often enjoy a considerable measure of freedom from parental restraint. Sometimes freedom passes into license and, as a consequence, the children grow up wayward and self-willed and do very much as they please. Under such conditions a distinct obstacle is interposed in the way of early training. Concerning the Dyaks of Borneo, Mr. Brooke Low declares: "They are fond of their children, and the children are fond of them. Indeed, the latter are quite spoilt, and the more mischievous a boy is, the prouder they are of him, and prognosticate great things from him when he gets older" (Roth, *The Natives of Sarawak and British North Borneo*, London, 1896, Vol. I, p. 102). At Tahiti and in other Polynesian islands, no regular parental discipline was preserved.

On the other hand, there are not wanting many instances of regular parental discipline, though this is usually secured without a resort to corporal punishment. Forrester Straits children are seldom disobedient, but even at such times they are never whipped (Haddon, in *Reports of the Cambridge Anthropological Expedition to Forrester Straits*, Vol. VI, p. 111). Among the Andaman Islanders a child will be reprimanded for being impudent and forward, "but discipline is not enforced by corporal punishment" (Man, in *Jour. Anthropol. Inst.*, Vol. XI, pp. 63 sq.). In South Africa the problem of discipline scarcely troubles Kafir parents. "Respect for old men, and especially for a father, is most marked. The parents are very fond of their children, and treat them very well on the whole, never fussing about

PRIMITIVE PEOPLES

trifles. They seem to have the knack of keeping children in order. Every child knows quite well what it may and may not do" (Kidd, *Savage Childhood*, p. 98). The Pimas of Arizona seldom whip their children, though the latter may be scolded, slapped, or shaken for their misconduct until they reach ten or twelve years of age (Russell, in *Twenty-sixth Ann. Rep. Bur. Amer. Ethnology*, p. 101).

Such diverse attitudes towards children might naturally be expected to appear as the outcome of a wide comparative survey. The reluctance to punish children cannot itself be referred to a single cause. Oftentimes, of course, it is due to excess of fondness. Savages, as a rule, display abundant affection towards their offspring, and this, not infrequently, leads to a reluctance to deny their requests or punish their misdeeds. In many instances the idea seems to be that punishment degrades and weakens the child. The boy must be allowed to grow up strong of will, independent in spirit, if he is to fulfill his whole duty as a tribesman, both in battle and council. Sometimes pure superstition is the controlling motive as among the inhabitants of the East India Islands. Here it is believed that when a person is disappointed for any reason, his soul-substance feels uncomfortable and is likely to depart from the body. The natives are, therefore, very unwilling to refuse a request, especially in the case of children. "When a child has worried its parents beyond endurance and receives a smacking, its screams cause an immediate revolution of feeling. It is no longer the child that is blameworthy; it is the parents. They feel that its soul-substance may go away, and that they can never forgive themselves" (A. E. Crawley, *The Idea of the Soul*, London, 1909, pp. 131 sq.).

In general, however, it is probable that the freedom possessed by primitive children is more apparent than real. Discipline and instruction are secured less by threats and penalties than by a reliance on moral evasion, by an appeal to feelings of pride or shame, by employing the stimulus of praise, flattery, or disparagement. In the later years of childhood these motives are powerfully reinforced through the training received in the initiation rites.

Education by Play. — Like the modern boy or girl the savage child is early occupied with various forms of play which not only amuse him, but serve as well to strengthen his muscles, arouse his intellect, and develop his powers of observation, imagination, and invention. Many games are mimetic in character. The child imitates in play the serious occupations of adult life. Dyak toys include well-made models of boats, little shields, spears, and swords, and tiny bows and arrows (Roth, *op. cit.*, Vol. I, p. 104). In Dutch New Guinea boys of four or five years of age, by practicing

with small models, learn to use the native *isja*, a canoe which capsizes very readily. In a few years they are able to manage the large boats with the greatest confidence (Van der Sande, *op. cit.*, p. 100). In British New Guinea, Haddon was fortunate enough to see the children playing games—a pig hunt and a kangaroo drive—in which the actions of their elders were vividly enacted. In another game, several boys, disguised in a dress of banana leaves, chased the girls about and made them scream. This was done in imitation of the procedure of the masked men who formed a secret society in their village and frightened the women (*Head-Hunters*, London, 1901, pp. 274 sqq.). Of the games played by Orintha Indian children, Miss Fletcher remarks: "Going on the hunt, with all the stir of preparation; taking down and putting up tents, the tall stalks of the sunflower serving as poles; the attack of enemies, the meeting of friendly tribes and their entertainments,—all these furnish incidents for days and days of play" (*Jour. Amer. Folk-Lore*, 1888, Vol. I, p. 110). The leading occupations of the Pueblo Indians—agriculture, hunting, the making of pottery and implements, weaving and building—are all imitated in the games of the children (Spencer, in *Columbia University Contributions to Philosophy, Psychology, and Education*, Vol. VII, p. 77).

Training through the Family.—Practical.—The unconscious training yielded by play and by other spontaneous activities of the primitive child is usually supplemented at an early age by the direct tuition of parents, grandparents, or guardians. The instruction they provide deals mainly with the practical arts of everyday life. The aim is to fit the child, as soon as possible, to take care of itself and be of assistance in the family. The sons participate in the work of the father; the daughters learn domestic science from their mother. In Australia, among the Victorian tribes, whilst the child is still very small and able to move only on hands and knees, a little digging-stick is put into its hands. Following the example of elder brothers and sisters, the infant searches for roots, for the larvae of ants, and for such living things as it can find in decayed wood. Very soon the child learns to kill small lizards and other animals which enter into the tribal dietary (R. D. Smyth, *The Aborigines of Victoria*, Melbourne, 1878, Vol. I, p. 48). As the Australian boy grows up, he is taught to throw the spear, to use the stone tomahawk, shield, and club. He learns how to climb trees and how to employ the net for fishing. He is trained to follow the tracks of animals and to recognize by the faintest indications the near presence of birds and reptiles. Thus he gains in the open air and by constant practice the field craft indispensable for the life he leads. In like manner an Australian girl learns how to build huts, to collect gum, to gather rushes

and weave them into baskets, to twist the woolly hair of the opossum into a kind of yarn (Smyth, *op. cit.*, Vol. I, pp. 49 sq.). Torres Straits children very early in life were expected to collect shellfish and other edible animals found on the reefs at low tide. Every boy had a small bow and arrows with which he shot birds, and little pronged spears for transfixing fish. As soon as he could manipulate the digging-stick, he was considered able to cater for himself (Haddon, in *Jour. Anthropol. Inst.*, Vol. XIX, p. 359). The training of Andamanese boys followed similar lines. They were provided with miniature weapons suitable to their age, and were instructed in the use of them. As they grew older they accompanied the men on hunting and fishing expeditions, and soon gained sufficient skill to be very helpful (Man, *ibid.*, Vol. XII, p. 329). New Guinea children help their mothers in tilling the fields, serve as drivers in boar hunts, assist in fishing, and attend to the laborious task of grinding and polishing stone implements (Van der Sande, *op. cit.*, pp. 155, 167, 175 sq.). A Samoan girl is taught by her mother to draw water, gather shellfish, make mats and native cloth. The boy, under his father's training, soon becomes useful in planting, fishing, housebuilding, and all kinds of manual labor (George Turner, *Nineteen Years in Polynesia*, London, 1861, p. 177). Kafir parents wisely allow their children to regard much of the work they do as a sort of play. The girls carry babies on their backs, "the nurse frequently being but little larger than the baby" (Kidd, *The Essential Kafir*, London, 1901, p. 17). They fetch wood and water, look after the weeding of the gardens, help in reaping the crop, winnow the grain, grind it and cook it. The chief occupation of the boys consists in herding the cattle which are kept at night in the kraal and driven out to pasturage in the morning. During the months when the corn is ripening, all the children of both sexes are sent into the fields to scare away the birds. This is the chief occasion on which boys and girls mix, and the first work to which they are set (Kidd, *Savage Childhood*, pp. 187, 206 sq., 214). Among the Unyamwezi, "as soon as the boy can walk he tends the flocks, after the age of ten he drives the cattle to pasture, and considering himself independent of his father he plants a tobacco plot and aspires to build a hut for himself. There is not a boy 'which cannot earn his own meat'" (R. F. Burton, *The Lake Regions of Central Africa*, New York, 1860, p. 205). The Torata of Brazil, an aboriginal tribe, send their children to the *bahito*, or men's house, as soon as they are weaned, an event which does not take place before their fifth or even their seventh year. The *bahito* is "a public school where the children are taught spinning, weaving, the manufacture of weapons, and above all singing, upon per-

PRIMITIVE PEOPLES

fection in which is centered the ambition of all those who wish to become chieftains" (Frie and Radin, in *Jour. Anthropol. Inst.*, Vol XXXVI, p. 388). Pueblo children are taught to work as soon as they can be at all helpful to their parents. Thus little girls of five or six years assist in caring for the younger children, fetch wood and water, and even help to prepare the clay for the pottery and the materials for basket weaving. As the children grow older they take gradually a larger share in the occupations of the men and women (Spencer, *op. cit.*, pp 77 sq.)

Moral. - In addition to this training in practical arts, there is, not infrequently, an effort to impart during the earlier years of childhood the elements of a code of morals. Thus, for example, Théri elders in their leisure moments will instruct the younger men in the laws of the tribe, "impressing on them modesty of behavior and propriety of conduct as they understand it, and pointing out to them the heinousness of incest" (A. W. Howitt, *The Native Tribes of South East Australia*, London, 1904, p. 300). Every Pima child receives careful oral instruction in moral, religious, and other matters. The boy has to sit up very straight and pay strict attention while his father or guardian tells him of the conduct befitting a Pima warrior and gentleman. "If he was not fully awake and paid indifferent heed to what was told him, the father's stiffened middle finger would suddenly strike the side of his nose, bringing his face around until he looked straight into his father's eyes" (Russell in *Twenty-sixth Ann. Rep. Bur. Amer. Ethnology*, p. 100). Where initiatory ceremonies are found in a primitive community moral instruction of this sort holds a very prominent place.

Initiation Ceremonies - Until the age of puberty, a period which arrives somewhat earlier among nature-peoples than among civilized races, the child's care and training centers naturally in the family. But on the approach of puberty this preliminary preparation for the duties and responsibilities of life is often supplemented by various ceremonies initiatory to manhood. These rites, in the lower stages of culture, are most commonly in charge of the elders of the community who employ a period of awakening mental and emotional life for the acculturation of useful lessons, practical, moral, and religious. Such initiation rites are found amongst peoples considered the lowest of mankind, as the Australians, Andaman Islanders, Hottentots, and Fuegians; and they exist in various forms amongst many other peoples who have passed from savagery to barbarism. It is probable that in their origin they go back to certain very widespread ideas of contagion regarded by the savage mind as especially threatening at a great functional crisis like puberty. On this theory the puberty ceremonies are intended to ward

PRIMITIVE PEOPLES

off or neutralize the evil influences manifest at such a time. In their practical operation, however, the initiatory rites, as they exist to-day, are chiefly significant as providing a systematic course of instruction for the youth of both sexes in those matters deemed of highest importance to the community. Initiation is the savage school.

Although there is wide variation in details, the leading features of the puberty rites reproduce themselves with substantial uniformity throughout the uncivilized world. On the arrival of puberty, boys, and often girls, are carefully secluded from the community at large, and, as a rule, are confined for a lengthy period in some special abode, remote from the settlement. They are debarred from all intercourse with the opposite sex. They undergo various ceremonies of a purificatory character. They are obliged to fast - either total abstinence from food for a time or partial abstinence from certain customary articles of diet and much-prized dainties. Almost universally, the rites include a mimic representation of the death and resurrection of the novice. They have now "died" to the old life of irresponsible childhood and to their childish ways. Usually they receive at this time a new name and learn an exoteric speech, both known only to the initiated. In the course of initiation the candidates are subjected to a number of ordeals, frequently of a brutal or disgusting sort. Such bodily mutilations as the knocking out of teeth, scarification, and tattooing leave permanent records on the body of the novice and serve to indicate his reception into the ranks of initiated men. Another very common rite is circumcision. Still other ordeals seem to have no other reason *d'être* than the mere desire to test the manly qualities of the candidate and to strengthen him in the endurance of pain and privation. Sometimes they are so severe as to ruin the health, and even to cause the death, of the weaker novices. Those who succumb are thought unfit for manhood, and for them there are few regrets. The "fittest" are those individuals who can face the greatest hardships with Spartan fortitude. Unwillingness to submit to these ordeals and inability to withstand them are not common. The savage had realized that an uninitiated man is a pariah who, if he be not expelled from the tribe, is subject to constant ridicule and abuse. The arrival of puberty finds him, therefore, only too anxious for initiation. However painful may be the trials and restrictions imposed on him, the candidate is ready to fulfill them with the most scrupulous care.

Educational Value of the Initiation at Puberty. - The instruction received by the candidates during their initiatory seclusion embraces a wide range of topics. In Australia it is at this time that the boys are taught the very complicated rules relating to the mar-

riago system. They become familiar with the sacred traditions and lore of the tribe, the boundaries of the tribal territory, and the reasons for the feuds with neighboring communities. They learn how to play the native games, to sing the sacred songs, and to dance certain "corroborees," which neither the women nor the uninitiated men are permitted to practice. Boys of the Kurnai tribe, after initiation, spend months in the bush as probationers. They are under the watchful care of guardians, "gaining their own living, learning lessons of self-control, and being instructed in the manly duties of the Kurnai, until the old men are satisfied that they are sufficiently broken in to obedience, and may be trusted to return to the community" (Howitt, *op. cit.*, p. 337). The boys are told to obey the elders, to live peaceably with their friends and share all they have with them, to avoid interfering with the girls and married women, and to observe various food restrictions. In Africa the Bawenda, a Bantu tribe of the Transvaal, isolate their children for three or four months. During this time the lads are under the charge of responsible headmen who spend much effort in teaching the boys sound principles for their future guidance. "They are warned against certain wrong and vicious habits, and encouraged to be faithful and loyal subjects to their chief, and to be good husbands and fathers. The gathering is known among the natives as 'School,' a term probably adopted since the advent among them of missionaries" (Grant, in *Jour. Anthrop. Inst.*, Vol. XXXV, p. 203). Novices belonging to Lako Nyasan tribes are harangued by the elders, bards, and magicians. "They are now men, and men's work is to be theirs. Hording, hoeing, reaping, and all domestic duties in which they assisted their mothers, they have no longer any concern with. War, hunting, and hearing causes must now occupy their thoughts, for they are to take the place of the fathers, and on them will depend the defense of the tribe and the maintaining of its honor" (Macdonald, *ibid.*, Vol. XXII, pp. 100 sq.). The Yno initiatory rite called *unyago* is especially elaborate. During the months spent in the bush the novices receive instruction from teachers, of whom every boy has one. "They watch over their pupils through the painful weeks of the *unyago*, teach them what is fitting and unfitting, and remain responsible for their welfare even after they have left their boyhood far behind" (Karl Weule, *Native Life in East Africa*, London, 1900, p. 188). Vay boys in Liberia during a year's seclusion receive instruction in war, hunting, fishing, and other manly arts. They are trained to withstand hunger and thirst, to fight bravely, and in all cases to redress wrongs and protect the weak. Especially are they taught how to form judgments on matters of tribal importance, in order later to be able as men to take part in

the deliberations of the council-house (J. Büttkofer, *Reisebilder aus Liberia*, Leiden, 1890, Vol. II, p. 305). Girls belonging to the same Liberian people go into retirement when ten years old and remain under instruction until of marriageable age. Various womanly duties — the care of children, cooking, making of nets — besides dances, games, and songs are taught them (Penick, in *Jour. Amer. Folk-Lore*, Vol. IX, pp. 220-221). While the Fuegian youth were confined in the kina or lodge, their elder brothers, their uncles, and older cousins urged them to be industrious, generous, and sincere, warning them that they would be unhappy if they did wrong (*Mission scientifique du Cap Horn*, Vol. VII, p. 376). At the initiation rites of the Diegueño Indians of Southern California the boys "were instructed in their future duties as members of the tribe and participants in the ceremonies, and were threatened with dire punishment if they should prove recalcitrant" (Miss Dubois, in *Amer. Anthropologist*, N. S., Vol. VII, p. 523).

In addition to practical arts and moral duties the curriculum of these savage schools often includes specific religious teachings. Especially does this appear to be true in Australia. There the mysteries possess a sacred character and enshrine the inner faith of the people. The initiatory rites are believed to have been instituted by the tribal gods who still watch over them. At the ceremonies novices are shown their images, rude affairs of sticks and mud, are taught to pronounce their secret names, and are further instructed in all the legends relating to them. According to Mr. Howitt, these ceremonies provide "a rude form of religion, which is taught to the youthful Australian savage in a manner and under circumstances which leave an indelible impression on his after life" (*Report of the Australian Association for the Advancement of Science*, Vol. III, p. 349). In North America, Mr. Hoffman remarks that the Ojibwa traditions "of Indian genealogy and cosmogony and the ritual of initiation into the Society of the *Mide* constitute what is to them a religion, even more powerful and impressive than the Christian religion is to the average civilized man" (*Seventh Ann. Rep. Bur. Ethnology*, p. 161).

It must not be supposed that these teachings are exclusively theoretical in character. Savage ingenuity, indeed, exhausts itself in devising methods for working on the curiosity and awe of the novices. Some of the initiatory rites are even of a painful nature, intended to teach the children in most vivid fashion what things they must henceforth avoid. In some Australian performances the guardians of the candidates talk to each other in inverted language so that the real meaning of their words is just the opposite of what they say. The lads are told that this is to

PRIMITIVE PEOPLES

teach them to speak the straightforward truth. Various offenses against morality are exhibited, and the guardians warn the novices against repeating the actions they have just seen. In one ceremony "two old men sat down on the ground, in front of the novices, and proceeded, with most ludicrous antics, to make a 'dirt-pile,' after the manner of children, while the men danced round them. The guardians told their charges that this was to show them that they must no longer consort with children and play at childish games, but for the future act as men" (Howitt, in *Jour. Anthropol. Inst.*, Vol. XIII, p. 448). Such "homosopathic" performances as these must make a lively appeal to the imagination of the novices. They constitute, in fact, the elements of an impressive morality play.

Conclusions.—The foregoing examples suffice, perhaps, to indicate the wide diffusion of initiatory rites and the general character of the instruction received by novices. Such rites, together with the instruction given in the earlier years of childhood, may be said to constitute primitive education. This educational system is *inclusive*, since it embraces not only economic pursuits, hunting, fishing, agriculture, and industry, but also the customs, etiquette, legends, art, morals, and religion of the community. It is a system *essentially social* in character. It has little concern with the upbuilding of the individual. Its sub-*boletes* are not culture, or self-realization, or mental discipline, but the solidarity of the group. In general, its method is that of *imitation*; the learner follows more or less blindly the procedure and patterns as set forth by his elders or superiors. By constant practice he acquires the dexterity required to do things as they have been done century after century before him. Finally, primitive education is distinctly *unprogressive*, serving rather to perpetuate existing conditions than to introduce an element of unrest and progress. The initiatory rites, in particular, are a chief means for preserving that uniformity and unchangeableness of custom which is a leading trait of primitive society. They tend not to encourage, but to repress, every favorable intellectual variation, and to keep all the members of the tribe on one monotonous level of adherence to the tribal traditions.

At the same time it is obvious that from the native standpoint the educational system outlined here is by no means a failure. It does what it is intended to do. On the practical side it assures the preservation of the learning and occupations of the past, and sets a standard, however low, which all must reach. Such a system makes for social stability. On the moral side there can be no question as to its effectiveness. The initiatory training, in particular, has lasting results on the character of the novices. Impressions conveyed in so striking a fashion lead to something more

PRINCETON SEMINARY

than a temporary "conversion"; the boys become indeed "men" and are now ready to accept the responsibilities and duties of adult life. It is not easy to imagine a surer method for a rapid but thorough training. The absence of any counterpart of the puberty rites in modern secular life indicates a serious failure in correlating our own systems of education with the great crisis of physical and psychic development.

PRINCETON THEOLOGICAL SEMINARY, PRINCETON, N.J.—Established in 1812 by the General Assembly of the Presbyterian Church in the United States of America, the work of instruction beginning in August of that year. Three students were present at the opening, and eleven more were admitted during the session. In the course of one hundred years 5907 students have been matriculated, coming from nearly every state of the Union and from foreign countries. The enrollment in 1911-1912 was 185. Of the matriculants 390 have entered upon foreign mission work. More than 3000 of the former students are now living. The faculty at present numbers twelve professors and four instructors. The library contains 92,000 bound volumes and 32,000 pamphlets. The faculty conducts a quarterly, bearing the title

PRINCETON UNIVERSITY

The Princeton Theological Review. The seminary grants no degree on the completion of the curriculum. The degree of Bachelor of Divinity is conferred for advanced work only, and only upon graduates of theology from this seminary or other theological school who hold the degree of Bachelor or Master of Arts or a similar certificate. J. D. D.

PRINCETON UNIVERSITY, PRINCETON, N.J.—*Historical Sketch.*—Princeton University was originally chartered as the College of New Jersey on Oct. 22, 1740, and the college was opened at Elizabethtown (now Elizabeth) in May, 1747, under the presidency of the Rev. Jonathan Dickinson. The original charter proving inadequate, a second charter was obtained, which passed the seal of the Province of New Jersey on Sept. 14, 1749. Upon the death of President Dickinson, in October, 1747, the Rev. Aaron Burr was elected president, and with his accession the college was transferred temporarily to Newark. The choice of a permanent location lay between New Brunswick and Princeton, the selection of Princeton being decided upon because of the generosity of the residents of the town, who offered 1000 pounds proclamation money, two hundred acres of woodland, and ten acres of cleared land for the establishment of the college. The new college building, which was completed in 1750, was at the time the largest college building in the colonies. It was named Nassau Hall, in honor of King William III of England, a member of the House of Nassau, at the suggestion of Governor Belcher of New Jersey, who modestly declined the request of the Trustees that he allow the college to be named after him. The college was opened at Princeton in the fall of 1750. President Burr died in September, 1757, and was succeeded by the Rev. Jonathan Edwards of Stockbridge, Mass., who lived only a few months after arriving at Princeton.

The College of New Jersey attained much prominence during the War of the Revolution. Its President, John Witherspoon, took a very active part throughout the struggle, and was one of the signers of the Declaration of Independence. Among the students of the college who became leading figures in the war and in the solution of the constitutional problems which the successful outcome of the war produced were James Madison, Aaron Burr, Gunning Bedford, William Bradford, Philip Freneau, Henry Broekholst Livingston, Hugh Henry Brackenridge, Morgan Lewis, and Henry Lee. During the war the course of instruction was interrupted by the presence at different times of both armies, Nassau Hall was wrecked, and the library of the college scattered and destroyed. Nassau Hall has been twice partially destroyed by fire, in 1802 and 1854; but it was rebuilt each time, and the original outer walls of the building are still intact.

PRINCETON UNIVERSITY

The growth of the college was slow throughout the first half of the nineteenth century. In 1834 there were six professors, two assistant professors, and four tutors, and 247 students. In 1868, however, when James McCosh was elected President, a new era began. During his administration gifts of upwards of \$3,000,000 were received, fourteen buildings were erected, the faculty was increased from ten professors and seven tutors to thirty-one professors, four assistant professors, and five instructors and tutors, and the number of students increased from 281 to 603. At this time the system of elective studies was introduced, the John C. Green School of Science was established, offering courses leading to the degree of Bachelor of Science, Civil Engineer, and Master of Science; and the Graduate Department was instituted. The development and growth of Princeton has been chiefly along collegiate lines rather than in the establishment of professional schools, the only professional courses offered at present being in civil and electrical engineering. On the 150th anniversary of the signing of the first charter, Oct. 22, 1890, the title of the corporation was changed from the College of New Jersey to Princeton University.

Government.—The government of the University is in the hands of a Board of Trustees, consisting of twenty-five life members who are elected by the Board itself, and five alumni members who are elected by the alumni. The alumni trustees are elected one each year, to serve for five years, and are eligible for re-election. The Governor of the State of New Jersey is *ex officio* President of the Board of Trustees. While Princeton's foundation was due largely to Presbyterian interest, and Presbyterians have always been greatly concerned in its welfare, the charter and administration of the University are absolutely unsectarian, and the personnel of the Board of Trustees is not confined to any one denomination nor is it predominantly clerical. The work of the Board is done largely through standing committees, the more important committees being on finance, grounds and buildings, curriculum, graduate school, library and apparatus, and honorary degrees. The President of the University is *ex officio* a member of the Board of Trustees. He is in general charge of the administration of the University, and there are associated with him several deans who administer certain departments, i.e. the Dean of the Faculty, who is next in authority to the President and who has especial charge of matters relating to examinations and standing; the Dean of the Graduate School; the Dean of the Departments of Science; and the Dean of the College, whose especial field is that of discipline. The faculty is technically divided into two sections: the Academic Faculty and the School of Science Faculty, but these faculties seldom meet

PRINCETON UNIVERSITY.

PRINCETON UNIVERSITY

separately, and the faculty *business* of the University is transacted in the meetings of the University Faculty, which comprises the professors and assistant professors in both the academic and *scientific* divisions. The instructors have the privilege of attending faculty meetings, but do not have a vote. The faculty is also organized according to departments, with a chairman or head over each who presides over the meetings of his department and reports to the President on departmental matters.

Educational Features.— Admission to the freshman class at Princeton is by examination only. A candidate must pass either the examinations set by the University or those set by the College Entrance Examination Board (C. E. B.). There are four undergraduate courses, leading to the degrees of A. B., Litt. B., B. S., and C. E. A student who has taken part of his undergraduate course at another institution may be admitted to Princeton and given credit for the studies of the Princeton curriculum which he has taken elsewhere.

In the nonprofessional undergraduate courses the work of the freshman and sophomore years consists almost entirely in prescribed studies of a rudimentary and fundamental character. In the junior and senior years a student is required to concentrate his work largely in one main department of study. In every case, however, he is obliged to take one course outside of his department and is free to elect one course as he pleases.

One of the distinctive features of Princeton's undergraduate educational program is the so-called "Preceptorial System." Instruction in what may be called the reading departments, philosophy, history and politics, art and archaeology, and the languages is given chiefly by means of informal conferences on the reading assigned. A "course" consists, not of the lectures given in connection with it or of the study of a particular textbook relied on by the lecturer, but of a prescribed body of reading to which the lectures given are supplementary. Each student is made responsible to a particular preceptor for his reading, and reports to him at least once a week in each course for conference. He reports to the same preceptor throughout for all his reading in the several courses of the special department in which he has chosen to concentrate his work, and for his reading in the courses outside his special department to the lecturer in that course or to the instructor who has charge of its formal conduct in the classroom. At each conference the preceptor usually meets from three to six of the men assigned to him. The methods of conference differ, of course, with the character of the subject, but are always informal, being intended, not as quiz or recitation or drill, not as a method of concluding, but, so far as the preceptor is concerned, as a means of finding out how thoroughly and

PRINCETON UNIVERSITY

intelligently the student has done his reading and, so far as the student is concerned, as a means of stimulation and enlightenment with regard to the study in hand. His work is explained to him where it is obscure, and its scope and implications are extended out of the wider reading and maturer scholarship of the preceptor, whose real function is to serve him as a "guide, philosopher, and friend." Study centers upon these conferences, as in the scientific departments it centers upon the laboratory. They are meant to supply to study the life which it cannot have in the formal exercises of the classroom and to bring the students into an intimate contact with their teachers which is hardly possible in other methods of instruction. All members of the faculty do "preceptorial" work; those who lecture or conduct the formal class exercises acting as preceptors in so far as their other duties will allow, as well as those who bear the special title of Preceptor. The preceptorial system was established in 1903, in the presidency of Woodrow Wilson, and has had a notable success. There are some fifty preceptors in the Princeton faculty. They bear the rank and title of assistant professor. The establishment of this system increased the budget of the University by about \$100,000 per year. It is largely supported by contributions from the alumni.

The Graduate School grants the degrees of Master of Arts and Doctor of Philosophy. It offers graduate instruction in philosophy, history, politics, economics, art and archaeology, classics, Romance languages, Germanic languages, English, mathematics, astronomy, physics, chemistry, biology, and geology. A handsome group of residential buildings, known as the Graduate College, is now in process of erection and will be completed in 1913. These buildings will provide a comfortable and attractive residence for some eighty graduate students and surroundings which are expected to prove very attractive to the students and conducive to scholarly work. The University also maintains a School of Electrical Engineering with a two years' course of graduate work leading to the degree of Electrical Engineer.

Grounds and Buildings.— The University campus consists roughly of three tracts of land, adjoining each other, and comprising about 340 acres of land. The main college buildings are on the central portion, while the new buildings of the Graduate College are being erected on the western portion. The eastern portion contains a large tract of woodland and extends from the campus proper to Carnegie Lake. There are, all told, fifty-three University buildings; Nassau Hall, completed in 1756, is the oldest and historically the most interesting building on college property. It is now used as an administrative building. The University Library contains about 280,000 volumes. There are sixteen dormitories

PRINCIPAL

which house about 85 per cent of the undergraduates. The architecture of all of the recent buildings is collegiate Gothic.

Student Life.—Because of its location in a small town at a distance from the large cities, the student life of Princeton escapes the undesirable distractions of city life, and has naturally acquired a tone of frank simplicity and youthful enthusiasm. The undergraduates are thrown for their recreations upon their own resources and those of a generous outdoor world, their life together is closely knit, and their friendships are strong and intimate. One of the leading factors in the democracy of Princeton's undergraduate life has always been the fact that most of the undergraduates live in the dormitories. It is the desire of the university authorities to provide rooms for all of the students on the campus. The freshmen and sophomores are required to board at the University commons, while eating accommodations are also provided there for as many upperclassmen as desire to use them. Most of the juniors and seniors, however, are members of and dine at the so-called "Upper Class Clubs." There are at present fifteen such clubs, each having an undergraduate membership of about thirty men.

Registration.—The total student enrollment for the current year (1911-1912) in 1543, classified as follows: Graduate School, 143; School of Electrical Engineering, 8; Seniors, 312; Juniors, 206; Sophomores, 208; Freshmen, 308; students qualifying for regular standing, 85; specials, 5. The teaching staff consists of 72 professors; 53 assistant professors or preceptors; four lecturers; and 53 instructors and assistants. John Grier Hibben, Ph.D., LL.D., was elected President in January, 1912, succeeding Woodrow Wilson, Ph.D., LL.D., who resigned in October, 1910.
G. F. C.

PRINCIPAL.—The chief educational officer in responsible charge of a school. When a principal is assigned to the supervision of several schools in the same neighborhood, he is called a supervising principal. H. S.
See SUPERVISION.

PRINCIPLE.—See GENERALIZATION; LAW.

PRINCIPLES OF EDUCATION.—A term in frequent use in American institutions to indicate the general field often designated as the science or philosophy of education. The term is used to avoid the use of the term "pedagogy," somewhat in disrepute, and of philosophy of education, as having a metaphysical connotation. The usual approach to the subject is through an attempt to formulate biological, psychological, and sociological as well as philosophical "principles." The entire subject, however, is discussed, as it may properly be, under the caption of

PRISON

PRISCIAN or PRISCIANUS CÆSARIENSIS—A Latin grammarian who lived the latter part of the fifth and the early part of the sixth centuries. He taught at Constantinople and published about 520 A.D. his *Institutiones Grammaticæ*. This is a most elaborate systematic treatise on Latin grammar, which continued thereafter to dominate the subject as an authority, much as Justinian's *Institutes* did Roman Law. It formed the basis of all subsequent treatises on Grammar such as those of Brice, Alcuin, Rabanus Maurus, and following the simple treatise of Donatus (qv) it was the text generally used. It is far more extensive than Donatus; in fact, is twice as long as Quintilian's *Institutes of Oratory*. It yet exists in about a thousand manuscript copies and is among the most numerous of early printed books. The *Priscianus Major* consists of the first sixteen books on Accidence; the *Priscianus Minor* of the two following books on Syntax. Sometimes, though not often, they appear together. The most important feature of the work is the constant practice of the author of quoting extensively from a wide range of Latin authors to illustrate definition, rule, examples, and exceptions. In all, more than 250 authors are quoted, many of them more than one hundred times. Vergil's *Æneid* is quoted more than 700 times. Among the authors frequently quoted are Aristophanes, Aristotle, Cæsar, Cato, Cicero, Demosthenes, Herodotus, Homer, Horace, Juvenal, Lucretius, Ovid, Sallust, Terence, and Vergil. It is from this source that the Middle Ages derived much of its knowledge of the classical authors. Priscian also wrote *De Nomine, Pronomine, et Verbo*, an abbreviated form of the Grammar. In *Partitiones XII Versuum Æneidos Principatum* he sketches a grammar lesson on the first twelve lines of the *Æneid*.

PRITCHETT COLLEGE

PRITCHETT COLLEGE, GLASGOW, MO. — A degree-granting institution, founded in 1860 and chartered as a college in 1897. The faculty of nine members includes four instructors of music and art. A preparatory department is also conducted.

PRIVAT DOCENT — See **DOCENT**.

PRIVATE INSTRUCTION — See **ADULT EDUCATION**; **CORRESPONDENCE SCHOOLS**; **HOME STUDY**; **SELF-CULTURE**.

PRIVATE vs PUBLIC EDUCATION — See **PUBLIC SCHOOLS**; **PRIVATE SCHOOLS**; **PUBLIC SCHOOLS, FREE SCHOOLS**; **FEES**; and **STATE AND COMMUNITY**.

PRIVATE SCHOOLS — **History.** — The question as to the relative value of public and private education goes back to antiquity. In the *Oratorical Institutes*, Quintilian informs us that the most eminent states had settled the matter in favor of sending the pupil, ordinarily, to the school in which there was a large number of pupils under public teachers. The main objection to the public school was held to be the corruption of morals by the bringing together of a number of children. Quintilian answers that schools are no more immoral than homes. It will be seen, therefore, that with him the argument is with regard to the relative value of public education and domestic education, not that of schools under public direction of the State and of publicly appointed governors, or managers, and the school instituted and maintained by private enterprise. In the latter sense of the term the private school can hardly be said to have been a noticeable institution till the time of the Reformation, since throughout the medieval ages, the instruction was either strictly ecclesiastical, under the direction of the Church, or strictly tutorial and domestic. The *Abedarinn* (*q.v.*) or petty school, however, is probably of similar antiquity. But the private school of a somewhat higher grade, which afterwards was of sufficient importance to invite the supervision of the Church, may be said to have begun at the Reformation period when the children of two or more families joined together to engage the services of one tutor. The most outstanding instance of the private school at the time of the Reformation was the *Schola Privata* of Philip Melancthon, which he held in his own house. Students came with insufficient preparation for the University work at Wittenberg, about the year 1524, and to meet this need Melancthon started a preparatory boarding school. He engaged teachers to assist him, and the school, though not large, was renowned and became the model for further schools—ordinarily public schools—in Germany.

The introduction of the Protestant form of faith in the public schools led to the with-

PRIVATE SCHOOLS

drawal of children of Catholic parents from public schools and the employment of tutors who taught privately. In England in 1580 the Lords of the Privy Council issued letters to the Archbishop of Canterbury requiring him to look into the religion of all schoolmasters, and in the same year the Archbishop made inquisition into the dioceses, inquiring for every parish the names of schoolmasters who taught "publicly or privately within any man's house within your parish," and "if any such schoolmaster is reported, known, or suspected to be backward in the religion now established by the laws of the realm" or any way "secretly hinderers thereof." "Private" schools of Catholics, on account of religion, were thus suppressed. This policy was further emphasized by the necessity of the possession by the schoolmaster of the bishop's license. A necessary part of such license was the undertaking to attend church with his scholars and to teach them *Deum Novell's Catechism*. (See **TEACHERS, LICENSING OF**; **CHURCH ATTENDANCE OF SCHOLARS**.)

There are indications that the subscription to the recognized position of the Elizabethan Church affected the question of the establishment of private schools with Puritans as well as with Catholics. Thus Eusebius Pagit, a "lame, quiet, learned" man, was forced to leave his living in 1592, and established a private school in London. "I taught a few children that I might get a little bread for me and mine to eat." In Oxford there are notices of the well-known private school of Edward Sylvester, c. 1620. William Chillingworth is stated to have probably received his education at Sylvester's school which was in All Saints parish. So, too, were Francis Cheynell and Thomas Willis, the most famous physician of the age. Another famous pupil was John Wilkins. Sylvester was a noted Grecian and acted as the interpreter to Metrophanes Critopylus, a Greek, when he came over to Oxford to be instructed in the doctrines and disciplines of the Church. Thomas Ingmethorp, rector of Great Stainton in Durham, was a private schoolmaster, eminent for his knowledge of Hebrew "and for his admirable methods in pedagogy." He held school in his private house, where he taught twelve or fourteen boys. He translated the catechism into Hebrew. But the most famous private grammar schools were undoubtedly those of John Milton (*q.v.*), 1630-1640, "that wonder-working Academy," and that of Thomas Farnaby (*q.v.*) in London, c. 1630. Farnaby was one of the most honored classicists of his time in Europe.

In Queen Elizabeth's reign separate schools sprang up for the teaching of arithmetic and writing. These were all private schools. In 1502 appeared Humphrey Baker's *Wellspring of Sciences* (an Arithmetic) and this contains at the end of the treatise the first known prospectus of a private school in Eng-

land. Gentlemen are invited to send "their children or servants" for instruction in arithmetic and similar arts, to Humphrey Baker, "for a reasonable consideration," and arrangements are announced for children boarding with him. Possibly Hugh Oldenale may have had such a private school yet earlier (viz. in 1543) for the teaching of bookkeeping. John Mellis had such a school in 1607, Henry Lyto in 1610, John Speidell in 1628, Robert Hartwell in 1630. In 1650 John Kersey's mathematical private school was well known. Charles Hoole tells us in 1680, in his *New Discovery of the Old Art of Teaching School* (and it must be remembered his was a "private grammar school"), that he had sent his boys for the last twelve years, after his own school hours, to Mr. James Hodder to learn writing and arithmetic. Another such private schoolmaster for writing and arithmetic was Noah Bridges. He says in 1653, dating from Putney, that in his school he taught writing and arithmetic, merchants' accounts, geometry, trigonometry, algebra, and also the Greek and Latin tongues. It may therefore be safely said that in Bridges' school there was a more comprehensive curriculum than in any public grammar school. The private school, therefore, inaugurated the teaching of the modern subjects, and, after the Commonwealth, led to the teaching of English as a recognized subject, even to the detriment of the classical languages. Still, there were private schools which followed, on the whole, the subjects and methods of the grammar schools.

The objection of the ministers of religion under the Act of Uniformity, 1662, greatly intensified the development of private schools. In many of these cases the direct sources are seen of the establishment of the important Dissenters' Academies (q.v.). They began as private schools in which both secular and religious subjects were studied. They took in pupils of very different ages. They were, for instance, the training ground of the next generation of dissenting ministers. The transition to the constitution and organization of the more or less public institutions of Dissenters' Academies was thus simple.

The history of private tutors is a branch of educational history as yet unwritten. But one of the origins of the private school is to be seen in a remark, in the biography of the Elizabethan Archbishop Parker, in a description of whose early education it is remarked, "It was usual in England at this time for the sons of the better classes to have private tutors, a class of boy friends being sometimes formed." This movement must have been in progress in the first half of the sixteenth century, for Erasmus and Vives, and other Renaissance writers, advocates for the royal and noble pupils that the tutor should have other children joined for joint instruction, as indeed was the practice, for instance, of Vittorino da Feltra.

It is difficult to trace the history of the girls' private school. (See WOMAN, HIGHER EDUCATION OF.) But there can be little doubt that its development is substantially the same as for the boys, viz. that it is an extension of the work of the private tutor or governess by the addition of further pupils from a second or third family. It is quite clear that there was a private school for young girls in Antwerp conducted by men. The well-known practice of the employment of a man as tutor in a family to noble girls led, in this case, to the conduct of a girls' school by men. (See the writer's *Lives and the Renaissance Education of Women*, p. xv.) In Stryppe's *Life of Whitgift*, Vol. III, p. 383, there is a protest against girls being taught within the precincts of the church, "especially seeing they may have instruction by women in the town." One of the earliest examples of a fully organized private school for girls is that kept by Mrs. Perwick in Hackney in 1643 — where as many as 800 girls had been educated. That there were other well-known private schools at Hackney, one of which was kept by Mrs. Salmon, 1647-1654, and at Chelsea is clear from Pepys and others. In 1618 there was a girls' private boarding school at Manchester kept by a Mrs. Ainger. The most famous of these private schools for girls was that of Mrs. Bathusa Makin (q.v.), who had been the governess to the daughter of King Charles I. A little later Hannah Woolley kept a private school and wrote *The Gentleman's Companion*, 1675. (See also ASHLEY, MARY.)

A quickening influence in the growth of the private school is to be traced in the establishment of private schools for the teaching of modern languages (a subject altogether neglected in the public schools). The earliest of these was that of Pierre du Bois, who wrote a textbook for French in 1553. Claude Holyband (q.v.), who taught French and Italian, was teaching in London by 1560 and established a most important private school. About 1580 John Florio (q.v.) was teaching privately in Oxford. For a full account of these modern language private teachers, see the present writer's *Religious Refugees and English Education* (in the Huguenot Society's *Proceedings*, 1911). It should be noted that in 1592 G. N. de la Mothe was already teaching privately girl pupils, and foreign teachers soon afterwards begin to be named as teaching in ladies' private schools. After the Restoration in 1660, private schools began to multiply so as to supply an education in which the basis should be the English language and modern subjects. This change may be marked by the publication of books like that of Brightland's *Grammar of the English tongue . . . making a complete system of English education for the use of schools of Great Britain and Ireland* in 1712. The growth of private schools and academies both for young gentlemen and for ladies in the eighteenth cen-

tury was remarkable. Some of these private schools have important histories, e.g. Chesham School in Surrey. Founded in 1686, when a master brought his scholars away from London to avoid the Great Plague, the school was at first carried on in the church belfry. The schoolmaster then took a house, and settled his school in the town. This school was taken over by a Huguenot refugee, a Mr. Bannay, and remained in the family till it was purchased by William Gilpin (*q.v.*), the well-known lover of and writer on British scenery. Another famous proprietor was Dr Mayo (*q.v.*), who made the school the center of the Pestalozzian influence in England.

The College of Preceptors (founded 1816) in Bloomsbury Square, London, was founded almost entirely by English private schoolmasters, and has played a significant part in the development of educational movements in England. The Association of Private Schoolmasters of Great Britain was founded in 1881. It aims to safeguard the interests of private schools and to secure their efficiency. At present the Association is concerned to check the establishment of new schools or the compulsory purchase of private schools through competition by the local authorities acting under the act of 1902 to establish secondary schools. Since 1902 many private schools have in this way been converted into public schools or have been put out of existence altogether.

F. W.

Characteristics of Private Schools.—A working definition of the words private school would be generally given and generally accepted in some such form as this. That while public schools are supported and controlled by the state government, private schools are self-supported and free of government control. As a corollary they are not open to all comers, but tend to be schools attended by a group or class. More is made in them of questions of personality and of special aim.

The self-support characteristic of private schools may take either one of two forms. A private school may be a commercial venture supported by direct payments to the manager or "owner," or it may be supported by subscription or endowment, so that the element of profit is more or less eliminated. The first form has comprehended, perhaps, the larger part of the private school group. Its characteristics are of course well known, and the sentiment of Socrates against it generally prevails. Commercial processes introduce self-advertising, often cunningly concealed but often very blatant; commercial attitudes of bargain and hicker encourage mutual hostilities and the taking of advantages on both sides. These things are unwholesome between teacher and taught. Moreover, commercial patronage is hardly the attitude for a true seeker of instruction. Yet these dangers are in practice not so great as they seem. In the first place,

there are saving and antiseptic influences in the occupation itself which meet and repel these infections. Just as, in the modern world, the publication of books and newspapers, or the production of art and music is left solely to the support and judgment of the market, so churches, museums, schools, theaters may and do appeal to private patronage without ruinous results. And there are also many counteracting advantages in this form of organization. Private venture schools are always very close to the true demand of the public; what people want, they know. They tend, moreover, to collect about interesting and effective personalities. Private schools get more than their share of good as well as of bad teachers. The relation between teacher and taught, being a matter of free choice and not controlled by a system of appointment, tends to be personal and endearing. Probably the most permanent service of private schools, since they are thus flexible, lies in their utility as experimental schools (*q.v.*) Their experiences serve as models or warnings to the community. Among what may be called the "marginal activities" of the school organization, private effort will always play a valued part; for no step to advance in education has ever been taken without the leadership of private schools. They are not only the home of lost causes and impossible loyalties; they work in advance of the main body. (See DEFECTIVES, SCHOOLS FOR; KINDERGARTEN; COMMERCIAL SCHOOLS; AGRICULTURAL EDUCATION; INDUSTRIAL EDUCATION; BOARDING SCHOOLS; DEUTSCHE LANDESKINDERHEIME; ÉCOLE DES ROCHES; EXPERIMENTAL SCHOOLS; etc.)

But though at present all lists of private schools are dominated by private venture, yet the endowed schools seem to be increasing and are perhaps destined to play a leading rôle among private schools in the future. They are more permanent than private venture schools, they have longer and riper tradition, they have generally more capital and resources, and they harmonize with the modern tendencies, to combination and to large enterprises. The endowed private school may be a stately institution, indistinguishable in structure and character from a large public school. It may have a long-descended pedigree; it may represent a religious tradition, or a much loved social tradition; it may have an honorable history of educational attainment. It is by its permanence emancipated from dangerous commercial traits, while on the other hand it is free to follow, without confusion or control, its special task or special aim. (See ENDOWMENTS.) Like a voluntary religious organization, such schools "enjoy the immense advantages of freedom of association, of personal initiative, of individual growth." They are important beyond their number. (See PUBLIC SCHOOLS.)

Private Elementary Schools.—Self-support, personal freedom, and personal care, flexibility

of organization, and prompt adjustments being the virtues of the private school, it will soon appear that the private school counts much more in some parts of the educational field than in others. It is not too much to say that in all elementary education, in comparison with the public school, the argument for the private school amounts to very little, and the tendency of modern educational evolution is all against it. In the *Report of the United States Commissioner of Education for 1910* it is stated 93 per cent of all children attending school in the United States are attending elementary schools, and that 92.6 per cent of them are in public schools. The same observation might be made of Germany or France. To find any considerable amount of private elementary work one must look to the more or less tolerated religious schools. But even in countries where this kind of school (see *PAROCIAL SCHOOL SYSTEM*) exists, as a significant part of the public system of elementary education, it is more and more coming under government control. This is the only important type of private elementary school.

Other motives for private elementary work produce little result. One motive may be found in the philanthropic schools, especially of large cities, corporate or private ventures, dealing with children unable, through poverty or other defect, to reach the public schools. Another, less significant, is found in private experimental schools (*q.v.*) engaged in trying new methods of elementary work. The private kindergarten still hold a large mass of work. Of course there are many more absentees from the public schools than this accounts for. A certain number of children are supposed to be picking up their elementary education in family conditions, or with tutors or governesses, or in "dame schools." Some of these children, chiefly of the rich and well-to-do, staying out of school, are getting a bad elementary education for want of system. Again, a large number of children in some places are losing their elementary education by going to work prematurely. But, allowing for all this absence, it remains true that nearly the whole of modern elementary education belongs to public schools and is conducted by them, so definitely do the two things, public school and elementary education, belong together.

Private Secondary Schools. — Far different is the case with the secondary schools. A brief survey of the field of education will show that this is the special home of the private school. Among private schools originated every form of what is now known as high-school work in America. A large fraction of it is still done by them, probably from a fifth to a quarter. Nearly the whole of secondary education in England up to 1902 was of the private school type. Even in Germany and France, the secondary schools,

though under strict government control, are class schools, receiving fees, and belonging to the *bourgeoisie* in type.

In Denmark and Norway, in Sweden and Finland the private schools are of special importance and influence, more particularly as regards secondary education. In all these countries the state leaving examination which is passed at or about the age of eighteen, is the only portal to the university. Candidates are prepared for it either (1) in state schools, in municipal schools, and in recognized private schools, or (2) in schools which have not gained or perhaps have not sought recognition, in private courses, and by private tuition. In the latter cases they are called *privatists*, and are subjected to a somewhat severer test.

These two leaving examinations are the medium by which the recognition of private schools is effected. If, in buildings and equipment, in curriculum, efficiency of staff, and salaries, a school reach a satisfactory standard, it is allowed to hold the leaving examination within its walls, just like a state school, and its masters, in the presence and under the guidance of a government-appointed censor from outside, conduct the *visa voce* part of the examination (a specially interesting and important feature in all these countries), whereas *privatists* have their examinations, both written and oral, conducted by an examination board who are strangers to the candidates. Such private recognized schools are regarded as helping to make up the national provision of secondary education, their statistics are found alongside those of the state schools; masters or mistresses from the one kind of school easily pass into service of the other — from the private school to the public or (less frequently) from the public to the private, — and not unfrequently a teacher may be found engaged in both kinds of schools at the same time. Teachers from a public school are as often as not found acting as government censors at the examinations in a private school; and just as often teachers at a private school act as government censors at a public school. Thus the two kinds of school are perpetually acting and reacting on one another, to the good of both; each tends to impart to the other its characteristic virtues and excellences; and the two, by varying methods, work harmoniously and effectively towards the same goal — are, indeed, so far as it is desirable, welded into one. (See DENMARK; FINLAND; NORWAY; SWEDEN.)

Even if in time more of our American work goes to the public high schools, still there are some legitimate demands for variety in secondary school life which various forms of private school must always be called upon to satisfy. Some things the public high schools would not do, if they could, or could not, if they would. Some of these demands will necessar-

PRIVATE SCHOOLS

only create private schools. And at any rate, looking at the matter from another angle, as long as there are private schools, for any reason, the larger part, the stronger part, and the best part of them will be secondary schools. (See HIGH SCHOOLS IN THE UNITED STATES.)

Vocational Schools.—The needs of the adolescent are various to infinity. The possibilities of secondary work are therefore legion. They may be roughly classed as vital, i. e. concerned with the development of personality, or vocational, i. e. concerned with the conservation of that personality to its life work. Of these, to the children, the most conscious, the most imperative, the most educating are the vocational preoccupations. But these have been, however, for several generations in our public schools strangely misunderstood, misapprehended, and neglected. Children have been obliged to seek their vocational training in America out of school. The effect is naturally the well-known early departure of American children from schools of the state. Only 3 per cent of the school population is reported to the Commissioner in 1900-1910, as attending public high schools.

Now private vocational schools not so reported have made up for a large amount of this neglected work. For example, the "business colleges" and schools have accomplished much good vocational work. (See CONVENTIONAL EDUCATION.) Generally they have been private ventures, originating spontaneously out of the pressing need. Most of these are still of this sort. But there are beginning to be private endowed schools which promise still more in the future. And the college and university courses of this sort must soon be reckoned with. Other occupations are represented in the community by private schools. The schools of music and other arts, whose names fill up the educational directories of our cities, are mainly such (see ART SCHOOLS; MUSIC SCHOOLS). They originate in the demands of the locality and are private ventures, though there are some private endowments, and some are affiliated with colleges and schools with endowments not under government control. They are exceedingly numerous and well attended. Handicrafts are taught in this way in an increasing number of schools, e. g. schools of telegraphy, dressmaking, cooking, pharmacy, and schools with a more comprehensive sweep like "mothercraft" and "philanthropy." There are advanced schools, under private management, but growing in publicity. We find the vocational trade schools and manual training schools of a general type, originating in private endowment and charging fees, but of great public power and value. We find great schools connected with special industries (see INDUSTRIAL EDUCATION). We find trade schools connected with churches. The whole field of secondary training is filled with vocational private

PRIVATE SCHOOLS

schools, setting an example to the public schools, nowadays gravitating themselves toward the public school system, but to be reckoned distinctly as part of the creditable result of the American individuality in education which would be seriously missed, if lost in the future, and which is embodied in private schools.

Among the vocational occupations of secondary schools is preparation of candidates for entrance not directly into the markets of life but into higher institutions of learning. In this class one might reckon candidates for government service and other occupations protected by examination or certification. No public school system can cover this ground completely. Army, navy, civil service, professional and technical schools, scientific work, have so many varying needs as to create a large body to give private preparation. Special dexterities imply special schooling. Hence the need here of private schools. (See INDUSTRIAL EDUCATION.)

Preparation for College.—A most significant group of schools in America, called "preparatory schools," or "fitting schools," has originated in the need of previous preparation for the college and universities, until recently themselves private schools. These schools have many special intellectual and social ideals; but their work, though actually, for historical reasons, rather specially linguistic and theoretical, has been accepted as representing several essential requirements for secondary culture. They have thus enjoyed a great prestige; and have been used to determine the course of public as well as private secondary education. They have been discussed and standardized by committees and other bodies appointed for this purpose, and doubtless exercise a great and wholesome influence over American education.

The participation of the public high schools developed in the last fifty years in the work of the preparatory or fitting schools of America has been of great service to education, in the standardization of college requirements, and in the move for uniformity as against the somewhat capricious and confused diversity of different college demands. Private and public schools have worked side by side, and the massive power of the public school has made itself felt. In the immediate future public schools may be even more useful in a similar way; speaking in the name of the general public, they can assure the colleges and universities, as private schools cannot, that they may now safely admit to their work, without too much distinction among subjects prepared in school, any person of suitable intellectual stature and competency. But great as are the hopes for the public school, nevertheless, as far as special preparation demanded by higher institutions is concerned, this will probably in the end remain a factor most stimulating to the creation of appro-

private private schools, as it is now a leading interest among them. (See COLLEGE REQUIREMENTS FOR ADMISSION.)

Another form of usefulness of the preparatory schools has been collateral among the groups of secondary schools in general. Not only is their work in their own task a significant part of the sum total of secondary education; but they have also influenced the theory and practice of all other secondary schools about them. This influence counts among the services of private schools to the country. Even where the public high schools have outdone their models, the private schools have after all many times set the fashion.

Military Schools. — Another special form of training deserves mention by itself, among the activities of private schools. In Europe the educational effects of universal military service have often been favorably commented upon. Even where, however, this service is universal and compulsory, there are special schools for vocational training of officers. In England, with certain brilliant exceptions, this work is left to volunteer effort. In America we have always had West Point, and Annapolis, our only special schools, to look up to for models and leadership. But, with some exceptions in the matter of drill and organization, the private schools in this country have taken over this matter entirely. The military schools of this country are private schools. Like all private schools they vary in efficiency; but the best of them show the great effects of a vocational ideal of a high code pursued with devotion. It is maintained in a recent article (*Military Service Institution Journal*, May, 1912) that the military situation in the United States is distinctly benefited by these military schools. Whether this belief be justified or not, the effects on the schools and pupils of this training are justly valued. The only criticism offered against them has been their tendency, owing to the superior efficiency of their moral training, to collect difficult cases in them, a criticism which has been made also of boarding schools, small colleges, and all private schools. (See MILITARY EDUCATION.)

Denominational Schools. — The forms of private school hitherto considered contemptible school chiefly as preparation for life. This ideal, however, does not contain the whole case. There must be motives for the creation of schools in which vocational preparation plays a less prominent part. School years are branches of the Tree of Life not less than of the Tree of Knowledge, and in their ethical and spiritual experiences ideals of great influence and worth must be reflected. There is, for example, the religious life, very hard to provide for in governmental schools. Governments can in modern times recognize no religious body above another; the religious experience must be left to church and home. There is

a most powerful and apparently most permanent argument for the creation of private schools. All religious bodies feel this impulse. Of the private high schools dealt with in the *Report of the Commissioners of Education*, two thirds are conducted by religious bodies. A large part of the colleges and universities in the United States are either under direct control of some religious body or in close affiliation with it. The Catholic Education Association, for example, has on its roll 67 colleges, 10 seminaries, 980 schools. The Protestant denominations are not backward. There are even schools intended not merely to be nonsectarian but carefully to diminish religion as life experience. All this is necessarily private school work. Modern government schools must apparently be secular.

Social Selection. — But there are other life experiences than religion which governmental schools cannot formally recognize except as incidents and by-products of their history. Among them are the experiences, the ideals, the habits associated with family life and the life of social groups. On the basis of social selection there are reared the most famous and perhaps the best of the private schools. The great English schools represent a social class. There are such schools, though closely under government supervision in France and Germany, representing social distinction as well as religion. In America, while we recognize that our ideals, our ethics, even our manners and customs, must in the main be such as to fit us to belong to the great public family of which we are all proud, yet even here there are family groups of a more private character, which seek for separateness and distinction, especially in education. How valuable such things may be is a matter of some dispute. The doctrinaire democrat is apt to denounce such ambitions; the parent face to face with the problem of his son's life is perhaps apt to overvalue exactly such distinctions as are cherished in private schools in some quarters.

The discreet American need not take sides. He will remember the federal constitution and the country's motto. At any rate, in the obbing tide of family life, especially in the great cities, artificial family experiences seem now called for in school life; in many situations, public schools may and do efficiently perform this function, yet there are situations, unsolvable by schools open to all comers, which must be met by schools of private effort. Many schools, even in America, must exist which intend no more and profess nothing else than social and domestic privacy. These schools are not necessarily objectionable or of no service to the state. "We begin," says Burke, "our public affections in our families." We certainly may begin them in such a private and secluded school, which is after all full of corporate spirit. There is no evidence that the academics of the eighteenth century, or

PRIVATE SCHOOLS

the boarding schools, or private day schools of our own time have not produced their share of public servants. (See **BOARDING SCHOOLS**; **ACADEMIES**; **FAMILY EDUCATION**.)

The scouting parties and forlorn hopes in the warfare of the Liberation of Humanity belong to private schools. It should be remembered that there is an ambiguity in the phrase "public service"; it connotes both what is done for the public and what is done by it. The main question about any educational institution therefore is not who pays for it but what it is worth to the common good. "Modern states," says the Commissioner, "shall certainly see to it that any citizen of any age who seeks instruction in any subject shall find instruction provided for him, not necessarily at the public expense, but made actually available for him by ways that are in his reach." In aiding citizens to forms of education not yet or not at all within reach of the public school, the private school has its permanent meaning. J. G. C. and J. R. T.

PRIZES.—See **PUNISHMENTS AND REWARDS**.

PROBABILITY.—See **STATISTICAL METHOD**.

PROBABILITY, THEORY OF.—If the exact conditions which govern a given event cannot be known or subjected to computation, we may nevertheless often ascertain the frequency with which it is likely to occur, or, in other words, its probability. We commonly designate the degree of this probability roughly by distinguishing between the impossible, the possible, the probable, the very likely, and the certain. However, more definite statements of amount of probability are made possible by the use of quantitative methods. There are two methods of calculating probability. The one reasons *a priori* or from a consideration of the very nature of the case, the likelihood of which we are computing. The other is empirical, and bases its results on an actual count of the frequency with which these cases occur.

(1) The simplest cases for an *a priori* calculation of probability are afforded by games of chance. In the tossing of a coin, for example, it would seem that the chances are even that it will fall heads. In stating the degree of probability of such cases a fraction is used, of which the total number of possible alternatives constitutes the denominator. The number of these alternatives which represent instances of the case the probability of which we are stating furnishes the numerator. Thus the chances of a throw of heads is said to be one half. The chances that the throw of a die will give, for example, a four are one sixth. If two dice are used, the chances of throwing a four are two sixths, or one third. The chances of throwing two fours are one thirty-sixth; for thirty-six combinations of the numbers on the dice are possible, and only one of these combinations is double four.

It is evident that this sort of a determination of probability is possible only where from the nature of the case the number of alternatives can definitely be known, and where the likelihood of each is presumed to be approximately equal. The combination of conditions that

actually determines the appearance of any given alternative is of course such as to make it necessary. But the conditions are so numerous and so variable as to render any particular combination just as likely as any other. *Per contra*, if a given alternative persists in occurring more frequently than its inherent probability would seem to indicate, one might suspect that the combination of conditions that produces it is for some hidden reason more likely than any other. For example, if four is thrown on an average not once in six throws but once in three, there is good reason to suspect that the die is loaded.

It is to be noted that the chances that a given case will appear will not increase because it has in a number of trials not appeared; nor will they decrease because the case has appeared once or many times. If on thirty-five attempts one has failed to throw double six, it is no more likely to come on the thirty-sixth throw than it was on the first one. Similarly, if one has just thrown double six, he is no less likely to get it on the next throw than on any other.

(2) The empirical determination of the degree of probability consists in gathering data as to the actual frequency of a given case. It is, therefore, a matter of statistics. Indeed, the predictive force of statistical calculations rests essentially upon the theory of probability. (See STATISTICAL METHODS) A reliable average fact can be ascertained only by gathering many cases and finding the average deviation or the probable error. The chances are even that any future measure will not differ from the average by more than the probable error. By studying the curve of distribution (see GAUSSIAN CURVE) one could ascertain the degree of likelihood of any measure. He could determine the measures within which any fraction of the cases would lie. As the number of cases from which the degree of probability of the occurrence of a certain instance is computed increases, the closeness with which this calculated degree of probability approximates to the correct one grows greater. If one found one black sheep in twenty and two in 100, it might be inferred that one fiftieth is nearer the true probability of the occurrence of a black sheep than is one twentieth. When the number of cases gets into the hundred thousands, the estimated probability cannot possibly vary more than a slight amount from the true probability. When the number of cases is not so great, reliability in the calculation of probability is much increased by taking these cases from as great a variety of conditions as is possible. Our data thus constitute a better example of a very large number of cases. If one wished to calculate the percentage of pupils that are eliminated from our schools yearly, and could not get complete records, he should gather the data he uses from as great a variety of places and school conditions as possible.

It is evident that in a field where the conditions are so complicated as they are in education, nearly all conclusions must be treated from the point of view of the theory of probability. Educational methods are often attacked because they sometimes fail. Standards are discredited because they prove unreliable in special cases. It is certain, however, that we possess little or nothing in the way of methods of teaching, standards for determining fitness either in teachers or pupils, devices of administration, etc., which can be infallibly relied on to yield only desirable results. It follows that excellence is a relative matter, and we must choose that alternative, the probability of the success of which is greatest. A realization of this fact would free the work of the school from much shrewd but ill-grounded criticism. E. N. H.

PROBATION, PROBEJAHR—A probationary year was introduced as part of the preliminary preparation of secondary schools in Prussia in 1820 and has been continued ever since. After passing the state examination candidates for the higher teaching profession are assigned to a seminar attached to a secondary school for a year for their theoretical training. This is followed by the probationary year of practice work. The candidates are assigned to their schools by the Provincial School Board and are placed under the director, who must arrange for them to teach in different grades and in several subjects. Both the director and specially assigned teachers must supervise the work of probationers. At the end of the year the candidates must make a written report of their year's experience to the directors. Where probationers have proved themselves in any way incompetent, the Provincial School Board has power to extend the period of probation. On the satisfactory completion of the year of probation, candidates are certificated and are eligible for appointment. For elementary teachers there is in Prussia a period of probation extending from two to five years, and teachers are not definitely appointed until they have passed a second examination, which may be taken not less than two nor more than five years after the first examination. (See GERMANY, EDUCATION IN.)

In France tutors in the *lycees* who have not the master's degree are appointed on probation for a year. They receive their appointment from the Rector, and, if satisfactory, are appointed by the Minister. In the elementary schools teachers are appointed on probation as *stagiaires* for two years, at the

PROBATION OFFICERS

and of which they may take the examination for the *certificat d'aptitude pédagogique*, and receive permanent appointment as *titulaires*. (See FRANCE, EDUCATION IN.)

PROBLEM.—Every conscious situation involving reflection presents a distinction between certain given conditions and something to be done with them; the possibility of a change. This contrast and connection of the given and the possible confers a certain problematic, uncertain aspect, upon those situations that evoke thought. "There is an element, which may be slight or which may be intense, of perplexity, of difficulty, of confusion. The need of clearing up confusion, of straightening out an ambiguity, of overcoming an obstacle, of covering the gap between things as they are and as they may be when transformed, is, in germ, a problem. It does not follow, however, that this problematic aspect must be consciously recognized as a problem; it may operate without its being formulated so as to direct the course of thinking and endeavor. (See METHOD.)

The primary position of problems with reference to stimulating and guiding thought—the problem fixing the beginning of reflective inquiry and a solution its end—accounts for the prominent place occupied by the asking of questions and setting of problems in educational practice. There are, however, two common and allied errors regarding the nature of the problem. When it is overlooked that the problematic factor may be implicit in the situation, rather than existing as a separate factor, the necessity of a natural inclusive situation of experience will be ignored; it will be assumed that the mere asking of a question in words, or the setting of a task, constitutes a problem. But in reality, all that the question as formulated in language can do is to suggest some difficulty arising within the pupil's own experience. It cannot create the problem, nor can it even serve to remind the pupil of a genuine problem unless especial pains are taken to use it simply as a stimulus to focus some problem occurring quite independently. This suggests the second error: supposing that what is a genuine problem for one person, such as the teacher, is necessarily a problem or the same problem for

PROBLEM

another. As matter of fact, the conditions in experience, the context, determine whether a matter is or is not a problem and what sort of a problem it is. J. D.

PROBLEM.—In Mathematics.—The word "problem" is rather loosely used in mathematics. A problem is really a question proposed for solution, from the Greek *πρόβλημα*, which has this meaning. The roots of the word are *πρό* (before) and *βάλλειν* (throw), so that a problem was something put forward for discussion or solution. In geometry the problem is distinguished from the theorem as being a proposition requiring some construction to be effected, while the theorem required some assertion to be proved. It is evident that the distinction is not scientifically very significant, for the statement "An equilateral triangle can be constructed" is a theorem, while "To construct an equilateral triangle" is a problem, although the mathematics of each would be essentially the same. In algebra and arithmetic certain writers have used the word "example" to cover all problems to be solved, and some have used "problem" to refer only to concrete exercises, or as the Germans call them, "clothed problems."

The educational interest attaching to the word relates chiefly to the nature of the concrete (clothed, applied) problem, and to the balance to be maintained between this type of proposition and the abstract (naked, pure) problem. In connection with the former there is ever a controversy over the inherited problem that has ceased to have, if it ever had, any immediate application to current conditions, and the modern problem of the artisan of the present time. Problems of this latter type have been called "real problems,"—an unfortunate nomenclature, since "real" is chronologically and geographically a relative term. What is real in one place or at one time may be very unreal in another place or at a later period. The term is not, however, of so much consequence as the idea connoted, and this idea is one to be considered.

The applied problem in the mathematics of the elementary and secondary school relates chiefly to arithmetic or algebra, including the work in simple mensuration. The questions of special significance relate to their origin, their development, their value, and their present status.

The earliest problems of the race were those relating to common life,—the increase of flocks, the records of granaries, and, much later, the exchange of money. Many problems of this kind are recorded on the cylinders of Babylon, and a few appear in the remains of early Egypt. Their use in the childhood of the race suggests their use in the childhood of the individual, and teachers recognize this fact by making all of the early applied problems of arithmetic relate to the child's immediate

PROBLEM

interests. With the development of a leisure class, and notably the priesthood, another type of problem appeared, one that partook more of the nature of a puzzle, although generally clothed in language that was at least related to the affairs of life. As time went on these problems became more numerous, and finally they led to a higher mathematics, the mathematics of the philosopher of the early days of culture. They are found in all countries and in all historic periods; they formed part of the medieval training in mathematics, and in the same way they enter into algebra to-day; they were looked upon as wit sharpeners for thousands of years, and probably with some justification; and they form a considerable part of the inherited problem material that is found in the schools at present. The attempt to justify this puzzle type is not by any means modern; it is found in various epochs, the question of the value of the puzzle having been raised from generation to generation from time immemorial. The Hebrew writers sought at times to correlate the puzzle with religion, as in the story the Talmudic writers tell of Rabbi Huna. While Rabbi Huna ate one portion, Rabbi Pappa ate four, but when Rabbi Huna dined with Rabina, he finished one portion while Rabina finished eight. Then said Rabbi Huna, "I had rather eat with a hundred Pappas than with one Rabina." The problem is to justify the remark of Rabbi Huna. The Christian writers also sought to justify useless computations by reference to the Bible, as when Wentzel (1599) demanded of his pupils that they should find the number of minutes from the creation of the world (3907 B.C., as he gave it) to the year 1598. Moralists sought to be relieved of the odium of apparently useless computation by introducing problems about the pernicious effects of vice, as in Johann Albert's work of 1534: "Item | Wenn einer alle tag 2cl in gebrandten Wein verzecht | Wo viel hat er verzecht im jar lang?" This movement reached its zenith in Schmidt's *Biblischer Mathematicus* (1736). The early arithmeticians of the Renaissance recognized the difficulty of justifying the presence of the problems of this type in the body of the text, and placed such questions in a special chapter towards the end of the book. Thus Rudolf (1526) has a chapter on *Schimpfrechnung*, a term that Thiersfelder (1587) defines in these terms: "*Schimpf Rechnung. Was sind Schimpf-Rechnung? Pflene | Künstliche Fragen damit man die Schuler | vnd andere diser | Kunst Liebhaber | erlustiget | Noyss vñ miltio | dise Kunst zu lernen | anzuwenden.*" In other words, it was clearly recognized that many absurd problems had a value in that they were amusing and therefore were calculated to interest a pupil in computation where a real business problem might fail. Problems of this type, consciously introduced for the purpose mentioned,

PROBLEM

are found in many works and in various countries. Thus Trenchant (1566) has a chapter "*De diuers leux & passeiens par nombres*", Baker (1568) states that "The 16 chapter treateth of sports and pastime, done by number." Tartaglia (1556) remarks, "*Ponamo anchora, per acuir l'ingegno di dilettanti*"; and the early Dutch writers have their chapters on "*Vermakelijcke Vraghen*." By the seventeenth century enough of these puzzle problems had developed to justify Claude-Gaspard Bachet Sier de Méziriac (1615) to publish the first noteworthy treatise on the subject, after which numerous works on mathematical recreations appeared.

The historical facts above given show that a problem that appears at present as useless may have originally been an excellent "real problem"; that "real" has merely a local and temporary significance; that much that appears as original in problem making is really the working over of old material, clothing it in new phraseology, — a rule that applies to practically all of the problems to be met in current textbooks; and that a type prevails if it is interesting, whether it has lost its practical significance or not, constantly supplanting more practical types that have no immediate interest for the learner. It is this question of interest that has kept hundreds of problems, in spite of the dictum of the educator that they ought not to be interesting. The rule of experience has been that a problem remains if it appeals to the learner as interesting, and if it illustrates some process, even though its subject matter has no direct bearing upon present life.

Considering the question now from the point of view of the demands of to-day, there is everywhere in the leading countries of the world an apparent effort to frame problems that shall represent modern conditions and at the same time be generally interesting. The former is much easier than the latter, for if problems involve the technical language of some particular industry, they fail to have interest for those who are not familiar with that special field of activity. Thus shop problems in carpentry have little interest for one who is working in forging, and those in metal work do not seem particularly real to one whose tastes are agricultural. Where a school or a class is closely related to some special industry, the solution is not difficult; but in the general type of public school, where children are being trained for various occupations, the specialized problem is not so satisfactory as the modernized problem of the traditional character. Such a problem should state modern conditions as to customs, prices, and terminology, but it fails of its purpose if it becomes too technical.

In algebra there have been successful efforts made to introduce problems in mensuration and applied arithmetic early in the course,

PROCESS

for the purpose of adding interest to the work. Efforts to find commercial or scientific applications of topics like factoring, quadratics, and radicals have not been very successful, and the immediate interest in these subjects must be found in the mathematics involved, in the game element, and in the assurance that the work is a necessary preparation for both pure and applied mathematics. In elementary geometry there are numerous applications that have some semblance to reality and that add a little temporary interest to the subject, especially with beginners. Where a course is given in geometric drawing, before or early in the high school, a little work in the study of Gothic windows and formal patterns may profitably find place. When a pupil once gets into the spirit of the subject, however, the pure science has always been found to be more attractive and to afford the only substantial basis for satisfactory work in either pure or applied geometry.

In trigonometry the range of applied problems is so great as to extend into the fields generally reserved for engineers, astronomers, and students of mechanics. The pupil has now enough maturity so that the supply of problems is practically unlimited. On the other hand, since this subject is generally elective, mathematics is studied for its own sake, and not only are fictitious applications out of place, but even real problems are not so important for the maintaining of the interest as they are in the lower branches. D. E. B.

PROCESS. -- With the development of dynamic conceptions of the world, mind, and society, it became necessary to express the idea of a succession of changes in which, in spite of changes, an identity of character is maintained, especially if the series of changes manifests a characteristic unity of result. *Process* is the term in most general use to designate this idea. In recent educational literature, we find, for example, such phrases as "educative process," "learning process," and "teaching process." In each case there is a complex series of changes tending toward a single, effective result. J. D.

See **ACTIVITY**; **FUNCTION**.

PROCLUS (c. 410-485). -- The most important of the later Neoplatonists, born at Constantinople and brought up at Xanthus in Lycia. He later moved to Athens, where he became professor of philosophy. His chief work was to systematize the whole *Parmenides*, *Republic*, *Timæus*, and *Cratylus*, and two theological works, *Περὶ τῆς κατὰ Πλάτωνα θεολογίας* (*On Theology according to Plato*), and *Στοιχεῖα θεολογική* (*Institutes of Theology*), giving an account of Neoplatonism. He was the author of a number of hymns to the Greek deities, of astronomical works (*Τεσσάρων τῶν ἀστρονομικῶν ὑποθέσεων*, *Outline of Astronomical Hypotheses*;

vat. v — B

PRODIGY

and a paraphrase of Ptolemy's *Tetrabiblos*), and mathematical works (*Περὶ σφαίρας*, *On the Sphere*; and a commentary on the first book of Euclid). Proclus is also supposed by some authorities to have been the author of a number of grammatical works, including commentaries on Hesiod's *Works and Ways*, scholia on Homer, a treatise on epistolary style, and a grammatical chrestomathy (*Χρηστομαθία γραμματική*). According to Suidas, he also wrote *Ἐνixeirῆματα κατὰ χριστιανῶν*, or *Animadversions against the Christians*, who opposed Proclus as the strong supporter of pagan religions and as a "hierophant of all the world."

PROCURATOR. -- See **UNIVERSITIES**.

PRODIGY, MENTAL. -- A person, especially a child, who is capable, usually with little or no training, of mental performances out of the ordinary. Such ability usually takes the direction of proficiency in some particular mental direction such as mathematics or music. The mathematical prodigy is able to give the result of what to the ordinary person is necessarily a long series of calculations almost immediately and without much calculation. Some of these mathematical prodigies, e.g., have been known to be able to tell the day of the week of any date in the past and future by simple mental calculations. Musical prodigies begin to play various instruments at early ages and without previous training. Such cases are to be sharply distinguished from the merely precocious child. Frequently this ability in directions other than that in which they show such marked proficiency is not great, and in some cases it is subnormal. The precocious child, however, is apt to be advanced to a greater degree than the normal in general mental capacity. To what extent precocity of this sort is the result of training, to what extent of native endowment, and to what extent it should be encouraged or suppressed are important educational questions. In many cases precocity has been present in children whose training has been out of the ordinary. Investigations such as those of Sully and Galton into the relation between precocity and genius seem to show that the view that precocity is usually connected with later mental weakness or even physical breakdown is incorrect. A large proportion of those who have ranked as geniuses in later life have been precocious in their mental

PROFESSIONAL EDUCATION

development. Precocity, therefore, is to be apparently welcomed, except in so far as it may militate against bodily development.

PROFESSIONAL EDUCATION — A term which includes in its broadest outline all that education which has direct value as preparation for professional calling or employment in life. It is differentiated on the one hand from the vocational education which relates to those employments of social grade not recognized as professions (see INDUSTRIAL EDUCATION), and on the other hand from the general or so-called "liberal education" which has no specific practical application in view. This latter phase of the subject is discussed under the caption LIBERAL EDUCATION. It is often argued that the "liberal education" of the old-time curriculum college was in reality a professional education for the few professions recognized as "liberal," i.e. the ministry, medicine, and law. This question is discussed in certain of its aspects in the article on the COLLEGE, AMERICAN. Even in the earlier period, the centuries immediately following the Renaissance, the education that was recognized as liberal was organized for certain classes alone, and in a sense was a professional education for a "gentleman." The entire theoretical or sociological aspect of the subject is discussed under the captions CULTURE, EDUCATION.

During the nineteenth century the scope of the "professions" was broadened by the development of modern sciences and the demand for an education which would prepare for the technical or "professional" careers based on them. Hence the various lines of engineering or technical education must be added to the more restricted "learned professions" of a few generations earlier. This breaking down of the lines of restriction, hedging the older learned professions, has had much to do with broadening the entire conception of education in recent times, for it has been necessary to recognize as liberal any education which would prepare for these lines of social service which demand broad educational preparation. Hence the conception of culture or of liberal learning as the service of learning to social needs has replaced the narrower conception that restricted it to the lines which did not deal directly with material things.

The entire subject of professional education thus falls into a variety of fields treated, each

PROFESSOR

under its proper heading, it being no longer possible to consider it either theoretically or practically as a unified phase to be differentiated from all others, or as merely the application of one type of education to one learned group, as that of the ministry. These various aspects are treated under LAW, EDUCATION FOR; MEDICAL EDUCATION; TECHNICAL EDUCATION; THEOLOGICAL EDUCATION. Various other special phases of education are also to be included, perhaps as subsidiary to these main groups. Among these are AGRICULTURAL EDUCATION; DENTAL EDUCATION, EDUCATION, ACADEMIC STUDY OF; PHARMACEUTICAL EDUCATION; etc.

PROFESSIONAL ETHICS. — See TEACHING AS A PROFESSION.

PROFESSOR — The incumbent of a chair, endowed or otherwise established and maintained, in a particular subject in a university or college. The use of the title is of late introduction in the history of universities. In the medieval period the terms Master, Doctor, and Professor were synonymous, but distinctions in their use were gradually made. So at Paris *magister* was used in the faculties of theology, medicine and arts, professor frequently, and doctor rarely. At Bologna the teachers of law affected the title, *doctores*, and sometimes *professores* or *domini*, rarely *magistra*, and this usage was transferred to Paris, where a *doctor* meant as a rule a doctor of canon law. A similar distinction was made at Oxford in the fifteenth century, the title *doctor* being used in the superior faculties, and *magister* in arts and grammar. In Germany and Scotland subjects went in rotation or by lot to the Regent masters until particular subjects began to be restricted to specialist teachers — a development reached in Germany by the governmental endowment of chairs for public lectures, and in Scotland in the eighteenth century through the growing extent and scope of each subject. At Oxford Lady Margaret, mother of Henry VII, in 1407 endowed the first chair, the Margaret Professorship of Divinity. This was followed by the endowment of Regius professorships at each of the Universities of Oxford and Cambridge in divinity, civil law, physic, Hebrew and Greek. It is probable that a further extension of the term to chairs in other faculties resulted from these endowments. There is as a rule but one professorship in each subject at Oxford and Cambridge, and subordinate instructors in subjects in which there is already a professor or in subjects which are not regarded as of sufficient importance for a special chair have the title of readers or lecturers. A similar practice prevails in the newer universities, where there is usually but one professor in each subject, other teachers being called lecturers. The custom in France is much the same.

PROGRAM

In Germany and France the title of professor is also given to some teachers in secondary schools and sometimes in normal schools. Such a title is as a rule in Germany merely bestowed by courtesy. In Italy and Spain teachers of elementary schools, both men and women, are called professors. In Great Britain and Ireland the title is invariably restricted to the holders of university chairs, except for its gratuitous use by teachers and performers of popular arts such as juggling, phrenology, boxing, dancing, etc.

Nowhere, perhaps, is the title of professor more loosely used than in the United States, and this abuse has been largely encouraged by numbers of educational institutions which desire to lay claim to a higher status than they deserve. In some parts of the country the title is popularly applied to any man connected with education work of any kind or grade. While the arrogation of the title to elementary and secondary schools is merely a popular usage, it is in many cases officially adopted by normal schools. And it perhaps follows, naturally, from the loose use of the term college or university, that the number of so-called professorships, paying in many cases salaries lower than elementary schools, is increased. Coming to the recognized institutions for higher education the most striking features in nomenclature of the instructing staff are the gradations within the rank of professor. These vary from the simple assistant professor and professor to assistant, adjunct, associate, acting, and regular professor and lecturers with the title of professor. There is a growing tendency to reduce the number of grades and not to make salary dependent on promotion and grade, provided efficient work as a scholar, teacher, or administrator is being done.

PROGRAM, DAILY. — See SCHOOL MANAGEMENT.

PROGRAM MAKING. — See SCHOOL MANAGEMENT.

PROGRAM OF STUDIES — The technical term used to designate all the studies offered in a given school to be distinguished from (1) the curriculum, meaning the group of studies systematically arranged for any pupil or group of pupils; and (2) the course of study, meaning the quantity, quality, and method of work in any given subject of instruction. This differentiation of terms was adopted by the Committee on College Entrance Requirements of the National Education Association in 1899.

PROGRESS

See COLLEGE REQUIREMENTS FOR ADMISSION; SCHOOL MANAGEMENT.

PROGRAM, SCHOOL. — See SCHOOL MANAGEMENT.

PROGRESS. — The conception of progress may perhaps be best defined through comparison with such terms as development, evolution, growth (*q.v.*). Like them it involves the idea of a series of changes which have a cumulative direction, in which the earlier members do not merely surrender their place to the later but have a certain continuity with them, so that all taken together form the history of one character or subject. The idea of progress differs in explicitly connoting change toward a more desirable state of affairs, something higher, better, more perfect. It also suggests, if it does not explicitly affirm, that conscious intention and effort play some part in bringing about the improved condition. Ancient Greek philosophy was familiar with the conception of evolution as applied both to organic life and to the world in general. It lacked, however, the idea of progress. Changes were conceived either as forming an endless cyclical round of passage away from and return to the same state of affairs; or as evidence of a certain falling away from true, or eternal, being, with possibly some attempt to return to the more perfect state from which a lapse had occurred. But this improvement was not progress but recovery of a prior state. Medieval thought was too dominated by the conception of the fall of man, of a recovery or redemption effected through supernatural agencies and involving an ultimate violent destruction of all things, to entertain the conception of progress.

A great part of the permanent significance of Francis Bacon is the clearness and force with which he asserted both the need and the possibility of progress, to be brought about through a scientific knowledge of natural conditions and taking effect in inventions directed toward anchoring the lot of man. The result was a radical change in the conception of the meaning of wants and of the power of knowledge. Wants in the static philosophy had always been treated as evidence of deficiency and imperfection, mere absence of true being. Now they were increasingly treated as the dynamic, motive forces of progress — a point of view which found a classic expression first in the social philosophy of Adam Smith and then of the utilitarian school. The object of knowledge was no longer taken to be the final cause (*q.v.*), a static perfection, but productive or efficient causes, a knowledge of which would enable provision of and adaptation to future conditions and, in many cases, deliberate control of the means of reaching ends. The mechanical point of view of modern science is thus partly the offspring, partly the source, of the growing importance of the notion

PROGYMNASIUM

of progress. The philosophy of the eighteenth century enlightenment was animated throughout by conceptions of the prospect of the indefinite perfectibility of man. Conditions that had previously been regarded as inevitable accompaniments of the human lot, political despotism, subjection of masses to intellectual authority, sloth and poverty were regarded as due to man's ignorance and lack of freedom, and as sure to pass away with the growth of science, and with economic and political freedom. While one result was an outbreak of utopias and millennial schemes of all kinds, anarchistic, communistic and socialistic, nevertheless we owe to this movement of the eighteenth century our present almost religious faith in the need of progress and in the possibility of making it the ruling principle of human affairs. The reflex effect of the idea of continual amelioration upon education has been very great. The materials and methods required in a progressive society differ profoundly from those appropriate to a stationary society. Since progress is not automatic but requires trained intelligence and forceful character, progressive societies depend for their very existence upon educational resources. Moreover, the conditions that are favorable to progress are also favorable to the release of energy from the restrictions of customs and convention; and only through education can the forces thus set free be safeguarded against undirected and destructive manifestation. J. D.

PROGYMNASIUM.—The incomplete or six-year classical school of the German States. See GERMANY, EDUCATION IN.

PROMOTION.—See GRADING AND PROMOTION.

PROMOTION BY SUBJECT.—A method of promotion devised to avoid the retardation of bright pupils by the mechanical organization of graded schools, especially when promotion is by full classes only at definite periods.

See GRADING AND PROMOTION.

PROMOTION OF TEACHERS.—See TEACHERS, TRAINING OF, IN SERVICE.

PROMOTIONAL EXAMINATIONS.—A form of test instituted in an attempt to determine the salary of teachers on some other basis than that of length of service, so common in our American cities, and the so-called "classroom efficiency." Such tests, or examinations, are attempts to add to both length of service and classroom efficiency a test of professional growth, as measured by a written or oral examination, or both, or the preparation of a short essay or thesis, on some pedagogical question or book. Such examinations have been instituted in Boston; Paterson, N.J.; Chicago; Kansas City, Missouri; New York

PRONUNCIATION

City; Lincoln, Nebraska; Saginaw, Michigan; Springfield, Ohio; and Washington, D.C., among larger cities, and also in a number of smaller cities. These examinations are always in addition to the usual service, years, and classroom supervision reports, and commonly include examinations in English, sometimes in other academic subjects, and usually in professional reading, observation, or study. Many superintendents feel that they have rendered valuable service, but the teachers in the cities where these tests have been instituted have generally looked upon them with but little favor, and in some cities they have openly and vigorously opposed them. E. P. C.

PRONUNCIATION, ENGLISH.—Differences in pronunciation are inevitable; their degree depends upon the degree of separation in time, place, and circumstances of any two speakers. No two persons pronounce exactly alike. When divergences associate themselves with some locality (provincialisms), or depart from recognized educated usage (vulgariisms), they become unacceptable. Among any group of people where intercourse is constant, a high degree of uniformity will result, and thus a standard of pronunciation will be established. Such a standard, arising among educated people, will be recorded as authoritative.

But English is spoken in too wide a territory for any one center of culture, in present conditions of intercourse, to extend its influence over the whole, and hence there can be no one authoritative standard of pronunciation for all English-speaking people. Even in England, relatively small as the country is, phoneticians find some difficulty in choosing which, of varying value, shall be accepted as the normal vowel in certain words. In the United States New England influence was formerly dominant; but, with the filling up of the Mississippi basin and the Far West, the weight of population and of influence has shifted westward, and standard American English now is rather a usage from the pronounced peculiarities of any one section.

In England, South English (SEng) usage (with which New England usage in the main agrees) is generally assumed to be the standard. Some differences between SEng and prevailing American (largely also North English) pronunciation are these: (1) A more marked diphthongization in SEng of the long front and back vowels, i: o: a: u: (symbols from the International Phonetic Alphabet);

PRONUNCIATION

e.g. *made* = *meid*, *note* = *nant*, etc. (2) In SEng, *o* before *r* is generally "open" (as in *lord*); e.g. *port*, *glory*, *more*, etc., become in SEng *pɔː*, *lɔː*, *glɔː*, *rɔː*, *mɔː*, etc., whereas in America, in these and many words like them, a "close" *o* (as in *note*) is the usual sound. (3) In SEng there is loss of *r* before a consonant or a pause (common in New England and the South also); e.g. *haː* *d*, *pɔː* *l* = *hard*, *port*. Generally in America a neutral *o* and often a trace of *r* appear, as *hɑːd*, *pɔːrt*. (4) *Not*, *odd*, *what*, *water*, represent a large class of words that in SEng have a vowel close to the *au* in *August*, but the majority of people in America make the sound *a*, with no difference between *a* and *o* in *father* and *bother*. American dictionaries, however, still assign to the vowel of these words the SEng value. (5) In SEng the vowel of *pass*, *past*, *bath*, *half*, *aunt*, *grant*, *chance*, etc., is *a* as in *father*. In America the usual sound is *ɔː* as in *bad*; in New England *a* is heard, but not universally. Some speakers in both countries, wishing to avoid both *a* and *ɔː*, sound the words with an intermediate vowel, near that of French *patte*, but long. This pronunciation, though distinctly artificial in origin, and not widespread, is supported by American dictionaries. (6) In SEng, *bare*, *air*, *there*, etc., have a very open *a*, a sound between the vowel of *bed* and that of *bad*, followed by neutral *ɜː*: *bɛː*, *ɛː*, *θɛː*, etc. The sound is heard in New England also, and of course from New England-born speakers elsewhere; the more usual American pronunciation is that with the vowel of *bad*, but longer, as *bɛː*, *ɛː*, *θɛː*, etc.

In all these cases SEng usage may in time spread over all England; but some of the extreme SEng peculiarities, such as the "long open *o*" (3), the vowel of *loud* set forth by some English phoneticians as the "standard" English vowel in *pure*, *aure*, *lure*, etc. (as if the words were *pyaw*, *shaw*, *lyaw*), are not likely to become established outside of England. Their English acceptance would only widen the divergence of usage in England from that of other English-speaking countries.

Common to normal English everywhere is the reduction of all unstressed vowels to either the neutral *ə*, or (more rarely) a lowered "short *i*." Enclitic words may suffer further reduction; e.g. *has* may be heard as *həz*, *hoz*, *əz*, or *-z*. Recognition of the constant presence of these so-called "obscure" vowels is not general, however, because most people are hypnotized by the conventional spelling into thinking that they give the vowels some individual quality; they think they may fortune (*fortunate*), propriatorz (*proprietors*), when they really say *fəʊntən*, *prəˈpraɪətəz*. The pronunciation of individual words is materially affected by the style of delivery, which varies from that of rapid familiar conversation to that of the professional "elocutionist." Neither furnishes standard English;

PRONUNCIATION

the standard should be sought in the careful conversational style of educated people. The pedantic should be avoided with the slovenly.

At present hardly more than incidental attention is given to the teaching of English pronunciation in the schools. There is more or less work in what is called "phonics," but the basis of this work is rarely phonetic. The attempt is made generally with ordinary spellings, and combines spelling with pronunciation. The current reform in modern language teaching, which throughout Europe is basing all living language study upon preliminary mastering of speech-sounds on a phonetic basis, is beginning to affect methods in kindergarten and primary instruction in English. The Dale method in England has aroused interest; and similar work in Australia is described by John Smyth in *A Guide to a Modern Infant Room* (Melbourne). The usual method in American schools is the so-called "family" word method, exemplified in numerous textbooks. The chief need is thorough training of kindergarten and primary teachers by means of adequate courses in phonetics, as at present required in all Scotch and urged in all English training schools for teachers. Very little of such work is as yet attempted in the United States. Thorough work of this kind, especially if a precise and clear phonetic alphabet is employed, will do more than anything else to bring about an approximately uniform standard pronunciation of English.

With the growing importance of phonetics as the basis of language instruction, it seems only a question of time when a scientific phonetic alphabet, such as the International or some similar alphabet, will be in general use in all English-speaking countries, as already on the continent of Europe, for purposes of phonetic study and as a pronunciation key. In some larger dictionaries for general use, as *The Oxford Dictionary* in England and the *Standard Dictionary* in America, a scientific representation of pronunciation will be found.

Authoritative statement of the present facts of English pronunciation appears in books varying from the somewhat advanced treatment of Sweet to the conservative view of Storm. American English is described by C. I. Grandgent in *Die Neueren Sprachen*, II (1895) H. C. P.

PROPORTION.—See RATIO AND PROPORTION

PROPOSITION.—According to one school, a proposition is the linguistic form in which the logical function of judgment is embodied. According to another school, it is the logical form in which the psychological function of judging acquires an objective logical status. In either case, a proposition is regarded as occupying the position of the primary complete unit of knowledge, lying between the term or concept, on one hand, and reasoning or consecutive discourse, on the other. A proposition is the assertion of a relation, positive or negative, between objects, it making no difference as to the logical character of the proposition whether these objects are physical, mental, or mathematical elements, or complex social and historical events. In the traditional Aristotelian scheme, every proposition consists of a subject, that about which something is asserted, and a predicate which affirms or denies something of the subject. Modern logicians generally agree that the subject-predicate form is not essential to a proposition, marking a peculiarity of the Aryan group of languages rather than a fundamental logical property. In all existential propositions, however, as distinct from those which assert simply a universal connection of elements without reference to whether the elements connected are themselves taken to exist, it may be said that there must always be a logical subject, namely, the existence denoted by the relation asserted in the proposition. This subject, however, need not be either the psychological or the grammatical subject, and need not even appear in the proposition as a linguistic form. Predication is then the entire qualification which is referred to the existence in question. Aside from the distinction of affirmative and negative propositions, the most important distinctions are the universal and the particular, the former being hypothetical, asserting a relation between conditions irrespective of the existence at any time or place of the conditions so related, and the latter asserting one or more things to which the relation applies.

For educational purposes, the interest attaching to the topic of propositions has to do with the importance for thought and knowledge of explicit statement and formulation. All thinking involves abstraction, but this abstraction evaporates into vagueness and ambiguity unless fixed and held before the mind by means of a term (*q.v.*) so that it may be re-

PROVERBS

ferred to some situation, that is to say, made concrete through application. It is the function of a proposition thus to fix and apply ideas otherwise vague and fluctuating. While the importance of propositions or formal statements has been often wrongly understood, through failing to see the need of an empirical situation out of which a meaning or idea emerges and to which it is applied, it is none the less true that the stating, the holding and defining, function is absolutely indispensable to any adequate acquisition of knowledge. While the particular form of words in which the act of holding and stating is expressed may be more or less arbitrary, the function of reviewing, summarizing, and holding together is indispensable, even to the earliest and crudest operations of knowing. J. D.

PROTAGORAS (c. 485–411 B.C.).—The first and greatest of the Sophists, who won a high reputation as a teacher and philosopher at Athens and in Sicily. His instructions were so highly valued as a preparation for public life that princely fees were paid for them. Although the work of Protagoras and the Sophists has been severely criticized, it ranks in importance along with that of the Humanists and the Encyclopedists. His philosophy was agnostic and its effect was to destroy the intellectual foundation of polytheism and prepare the way for the teachings of Heraclitus and the Stoics. He has been regarded as the originator of the sciences of logic, philology, and grammar, and the distinction of genders and moods is attributed to him. His chief works, of which only a few fragments remain, were *On Truth* and *On the Gods*. W. R.

PROTESTANTISM.—See REFORMATION AND EDUCATION.

PROVERBS.—The educational importance of proverbs after the time of the Renaissance was based on their use by ancient writers, *cp.* Aristotle, Chrysippus, Cleanthes, Plutarch, Theophrastus, Suidas, Plato, King Solomon, "the greatest seaports, the greatest emperors, the inspired pen-men of sacred oracles." Finally, the example of Christ was cited. Thus for subject matter the proverb was regarded as a type of precept, and the virtue of this kind of teaching *Vives* says is that "everybody can soon con them and bear them in mind." The educational importance attached to proverbs may be judged by the large number of editions of Erasmus' (*qv.*) *Adagia* and *Apophthegmata*. In 1502 John Heywood composed a popular work entitled *A Dialogue containing*

PROVISIONAL APPOINTMENT

the number of effectuell proverbes in the English tongue, and in his Preface, he states their use; "And their sentences include so good a reach, That almost in all things good lessons they teach." The most important school textbook of proverbs was that of John Clarke (*q.v.*), in 1630. It is founded avowedly on Erasmus' *Adagia*, but Clarke not only dwells upon the preceptual value of proverbs, but also regards them as "especially profitable" to scholars for attaining "elegance, sublimity and variety of the best expressions." It was on this ground that Charles Hoole (*q.v.*) recommended their use, in his *New Discovery of the Old Art of Teaching School*. Besides Erasmus, Reuener's *Symbula* and Lycosthenes' *Apophthegmata* (1555) were widely used for Latin, and for Greek the collection by Possehus (1505) (See ORATION, SCHOOL.) Clarke states the pedagogical use of proverbs to be, "for the master to cause his scholars every day to repeat a head or two and interpret them and appose his scholars therein; or cause one boy on a form to appose and ask another. This will both teach and remind them of all learning, history, and antiquity; and be a synopsis of most useful and delightful passages in their whole life." He affirms that the benefit of such practice will soon be found to be "meredibly great." The number of collections of proverbs for purposes of the school or scholars was enormous, and in the teaching of all languages (*i.e.* not merely Latin and Greek) the proverb played a great part in the sixteenth and seventeenth centuries. Haron spoke of the high value of collections of acute short sentences, and Cowley (*q.v.*), in his scheme for the *Advancement of Learning*, thinks that the progress of natural science would be helped by the collection of scattered little proverbs amongst the ancient poets. F. W.

PROVISIONAL APPOINTMENT.—See TEACHERS, APPOINTMENT OF, PROBATION.

PROVOST (Lat. *Propositus*).—An official term of very early use, *e.g.* for the rector of a manor (*cf.* the *Prévoit des Marchands* at Paris), for the abbot of a Premonstratensian monastery, etc. Thence naturally transferred to the head of certain colleges at different universities, *e.g.* Oriel at Oxford, King's at Cambridge, etc. The term is occasionally

PSYCHASTHENIA

used in America to designate the chief executive of a university, as at Pennsylvania (*q.v.*) or more recently, as revived at Columbia, to designate an office between that of president and that of dean.

PRUDENTIUS, AURELIUS CLEMENS

(348-c. 410).—The chief early Christian poet, born, as it is supposed, at Saragossa. He held a court appointment which he gave up on becoming a Christian. He went to Rome, and the sight of the Catacombs and stories of the martyrs made a deep impression on him. He retained his love for ancient Rome, joined with enthusiasm for Christianity. His chief work from the educational point of view is the *Psychomachia*, which Mr. Glover interestingly translates as the *Holy War* (recalling Bunyan's work). This work was one of the most popular of medieval writings and is of importance in connection with the development of medieval art; it certainly exercised a greater educational influence than any other of Prudentius's writings, which persisted even into the sixteenth century. Thus Dean Colet in his Statutes for St. Paul's School (1518) prescribed Prudentius, and as late as 1583 Archbishop Grindall named Prudentius as one of the Latin verse authors to be read in the Free Grammar School of St. Bees in Cumberland.

The *Psychomachia* was a didactic allegory written in Latin hexameters, in which the Christ-given virtues fight against the vices which threaten the soul. Linguistically, Prudentius, whilst copying old classical models, introduces new words for church purposes, together with archaic forms on the one hand and contemporary terms on the other. In his work, *Against Symmachus*, Prudentius appeals for the abolition of gladiatorial shows. F. W.

PSEUDOSCOPE—An instrument which reverses the relations of the stereoscope (*q.v.*). The image which would naturally fall on the right eye is thrown into the left eye, and the image which would naturally fall on the left eye is thrown into the right eye. The result is that objects which would normally be perceived as solid are seen as hollow, and, conversely, objects which are normally hollow are seen as solid. Remote objects are seen in the foreground, and objects in the foreground are projected to a distance. C. H. J.

See PSYCHOLOGICAL LABORATORY, EQUIPMENT OF.

PSYCHASTHENIA—A mental disease with symptoms similar to many of those

found in neurasthenia (*q.v.*), and by some authors considered to be the mental counterpart of the latter. This disease commonly begins in childhood during the years of growth or at the adolescent period, and, without appropriate treatment, it continues for years with periods of exacerbation and betterment. It is found to arise particularly in those children who are timid, impulsive, irritable, moodish, scrupulous, suspicious, passionate, or awkward.

When the disease becomes fully developed, the symptoms are of great variety, including tics (*q.v.*), impulsions, phobias (*q.v.*), simple manias (e.g. dipsomania, etc.), obsessions (*q.v.*), and impulsions which are irresistible: kleptomania, pyromania, etc. The patient is anxious and there is often agitation, which may be purely mental, composed of such processes as continued interrogations, a tendency to counting (counters or arithmomanias), or it may result in attempts at expiation for certain (true or supposed) acts, which are judged to be wrong. The agitation may also lead to the formation of one or numerous phobias which may be fixed or may be shifting in character.

With these purely mental symptoms there may be vague feelings of discomfort or there may be exaggerations in the form of neuralgias; the vasomotor system may be disordered and the individual sweat at the least provocation. After, and sometimes before, puberty the genital sense is often altered, and it is common to find lessened sexual ability. The questionings and scruples and feelings of expiation may lead to sexual perversion, to the performance of sexual acts in unnatural ways (see SEXUAL ANOMALIES), and as an effect of the feelings of need of expiation there may result an automutilation.

The attention is affected; it becomes lessened; sometimes it is impossible for the individual to attend to things even for short periods of time. With this there may be a consequent memory defect and a disturbance in thought sequence or in normal associations. Feelings of incompleteness and of insufficiency arise and lead to troubles of the will. Movements become maladroit; walking may become slow and otherwise abnormal, and there may be an aboulia. All these lead to what Janet has described as a difficulty of adaptation of mental operations to external conditions.

Some of the symptoms in this disease have, in later life, been analyzed and have been found to be dependent upon mental traumata or accidents in childhood. This is true for the obsessions, phobias, impulsions, etc. Freud considers the state of anxiety to be a special form of psychoneuroses, and calls it anxiety neurosis, but in this he is not supported by many others who have given close study to the disease. The important fact, however, which has been demonstrated by Freud is that many of the states of anxiety, even though they be

without any mental content of a sexual nature, are due to sexual traumata at an early age. It should be noted that the term sexual in this connection has not the same connotation as is usually given it in English; the term being here used in the German sense. In all the conditions, whether due to sexual or other accidents, the individual attempts to escape from the thoughts and impulses which arise, and a substitution takes place which leads to acts not in harmony with the external conditions. It is because of this substitution or replacement that abnormal modes of reaction arise, the individual often being unconscious of the reason for the particular acts or mental processes. This is the underlying condition in the "complex" which may attain such a magnitude or degree that the thoughts and actions appear like those of the insane.

Psychasthenia is on the whole a curable disease, the possibility of cure depending upon the ability to discover the causative factors. Rest is not indicated here as it is in neurasthenia, and, in fact, enforced rest may lead to asthenia or aboulia, in which condition the patient is worse than before. Spontaneous recoveries occur, but usually the psychasthenic state is progressive until the cause is removed. Because of its origin (in childhood) and of its cause (mental traumata in childhood), the disease commonly begins during the school period, and it is influenced in many ways by school work. Since treatment does not depend upon rest, the child should be kept at school work, and attempts on the part of the teacher to bring about orderly sequence of thought and proper adjustments may be beneficial. S. I. F.

PSYCHIATRY.—Literally the cure of the mind, but used as a general term for the study of mental diseases. While all mental abnormalities are included under this term, the psychiatrist deals mostly with those which require treatment in the hospitals for the insane or for the feeble-minded.

Mental diseases have been studied in a variety of ways, and attempts have been made from time to time to classify all of the various types of the disorders symptomatically, i.e. according to similarities of symptoms; e.g. any kind of excitement was called mania, all kinds of mental depression were called melancholia, etc. But any symptomatic classification must necessarily be inadequate unless there be many cross classifications, e.g. melancholia associated with motor excitement, etc.

PSYCHIC

A similar symptomatic arrangement was made by classifying mental diseases according to cerebral localization, known or supposed, e.g. those showing increases or decreases in motility or in ideation (Wernicke). Again, numerous attempts have been made to group various forms of insanity in accordance with etiology, and this led to the grouping of cases which outwardly show very diverse symptoms, but which superficially appear to have a single cause, e.g. insanities from accident, childbirth, alcohol, etc. Recently, however, there has been an effort to group the insanities according to no single criterion, but in accordance with the cause, course, and outcome, the work chiefly of Kraepelin. When the three criteria are taken all together as evidences of particular diseases, various forms of insanity may be grouped into about ten general classes. In addition there are many subheadings, e.g. in the group toxic-psychoses are found all forms of intoxication due to extraneous causes (See INTOXICATION; ALCOHOL, THE USE AND PSYCHOLOGICAL EFFECT OF.)

The results of the investigations of brain diseases are of special interest to the teacher, for they show unmistakably that the origin of many disorders is to be found in childhood, even as early as the fifth year. The abnormalities are slight at first, but they gradually increase until they lead to commitment to an institution. But by proper treatment in early years slight abnormalities might be aborted or replaced by normal ideas and actions. It is because the psychiatrist usually sees the result of a disease of many years' standing that he is often unable to deal with it in any curative manner and that he is often compelled to be a caretaker of the insane rather than a physician. S. I. P.

PSYCHIC.—An adjective which is used as a synonym of "mental." It refers to all

PSYCHICAL RESEARCH

of the activities of the mind (Greek *psyche*). The longer form of the adjective, psychical, has in recent usage been employed for the most part to refer to spiritualistic phenomena.

C. H. J.

PSYCHICAL RESEARCH.—When this term is defined as the "examination of the amount of truth contained in world-wide superstitions" (Andrew Lang), the definition is based upon the unity of interest and attitude which the term represents in the *Proceedings of the Society for Psychical Research* (S.P.R.), founded in 1882. The definition may be supplemented by adding to it: the interpretation, by the aid of psychological principles and theories, of the phenomena investigated. Yet the testing and warrant of the supernormal has determined the current of the movement, and has in so far aroused the critical skepticism of the guardians of the scientific interests of psychology. The program of "psychical research" as the examination of the questionable but traditionally or fallaciously accredited in the realm of mind is largely open to the preferences of shifting interest. Of the subjects assigned to the original committee—sufficiently suggested by the terms telepathy, hypnosis, apparitions, spiritualism, premonitions, etc.—those possibly evidential of supernormal, extrahuman, or rare and irregular powers and forces, have attracted largest attention and built up a voluminous literature. These outlying phenomena, when substantiated, may be incorporated into the borderland of psychology, and thus yield additional data illustrative of psychological relations; or they may resist such incorporation and be accepted by those convinced of their validity as subversive of or demanding an extension of the limits of psychological science. Since the content of "psychical research" tends to drift away from the former and towards the latter position, it traverses obliquely and irregularly the developing trends of psychology. The resulting detachment from psychology is the issue of a diversity of interest as well as of a general perspective of procedure, purpose, and value.

The question of telepathy has been a leading one in psychical research. It is capable of experimental test; but the results thus reached (unless entirely negative) may be interpreted to indicate that telepathic action is obscurely limited by conditions and by the psychological state or endowment of rare individuals. The hypothesis is largely used to account for, and is also regarded as supported by, the spontaneous transfer of appearances (phantasms), warnings, information, etc., in critical situations, from a distant agent to an interested percipient. The "vivid" nature of such appearances or messages, at times approaching the status of a prediction anticipating a corroboration by ordinary channels, forms

the crux of the problem. To eliminate chance, plausible anticipation on the basis of acquired knowledge, subconsciously assimilated information and shrewd emotional logic, is most difficult, and the establishment of a negative can hardly exhaust the possibilities of the case. The hypothesis once entertained or accepted offers endless extensions to account for revelations, premonitions, etc. That this entire body of evidence has been critically reviewed with reference to its incorporation within the accredited range of psychological processes is set forth in the article on telepathy (p. 5).

The phenomena associated with *mediums* and *spiritualism* form a second large division of psychical research. The physical phenomena relate primarily to the behavior of inanimate objects in the presence of the medium in apparent defiance of physical laws. The levitation of tables and movement of objects remote from the medium are typical. Here again the essential logical step is to establish the negative that the movements are not due to the undetected efforts of the medium or of sympathetic participants (table turning; see *SUBCONSCIOUS*). If mediums were willing to accept conditions proscribed by physical science, the claims could be definitely and promptly tested. They invariably impose their own conditions, yielding on irrelevant details; so that the investigation becomes a contest of shrewd observation on the part of handicapped investigators to detect a *modus operandi* concealed by darkness, by the regulations of the séance, and by the prescribed repertoire of the medium, and the rejection of crucial variations in the tests. The large amount of fraud detected in detail, the yet larger suggestion of suspicious circumstances, give to this branch of investigations a fairly conclusive presumption of a negative issue; at the same time a laxity of caution, an unfitness for the rôle of detective, and a variable credulity contribute to the accounts of such physical sciences an element of extravagant marvel. The other division of "mediumistic" phenomena relates to the revelation on the part of the medium (by trance utterances, automatic writing, answers to questions, etc.) of facts, events, utterances, confidences, etc., presumably inaccessible through ordinary channels. The conclusion that such revelation of private details requires the belief in the "control" of the medium's mind by a departed spirit constitutes the hypothesis of spiritualism. It is equally open to conclude that returning spirits are responsible for the physical manipulations. The evidence offered in support of this view is endless and of great variety, but most difficult to appraise. The case of spiritualism has been concentrated upon the more critical examination of the revelations of a few mediums, under conditions apparently incompatible with intentional fraud. If such mediums are un-

willing and unable to coöperate by revealing what they know of their own methods, progress seems blocked and the situation baffling. The very large allowance to be made for skillful "faking" on the part of the medium, for unintentional prompting on the part of the sitters, and for the general neglect of significant detail, for malobservation, for unwitting shaping and exaggeration of personally disturbing incidents into marvels, must remain as a substantial discount of all such records. The further development of these phenomena in evidence of ghosts, haunted houses, etc., forms a point of historical connection with ancient and popular beliefs. Their reurrection is dependent upon the standing to be assigned to the mediumistic revelations recorded in the *Proceedings of the S.P.R.*

A field illustrating the manner in which the interest in psychical research cuts across the differently motivated pursuit of psychological analysis, and does so in part profitably with an enlargement of insight, is that of the investigation of abnormal states, of hypnosis, automatism, crystal gazing, etc. The possible relation of the telepathic or clairvoyant power to the altered mental condition of the hypnotic subject has led to the use of hypnosis as a means of studying such powers. It has also led to the general conception of a subconscious phase or organization of personality, "subliminal self," which in turn is called upon to support apparently supernormal operations and impugn the adequacy of the conception of consciousness in accredited psychology. Accordingly the mediumistic revelations may be subliminal; but the endowment of the subliminal self with powers transcending in type and scope those of the accredited conscious self again forms a parting of the ways for psychical research and for abnormal psychology. The bearing of cases of dual personality upon the interpretation of trance states has been acknowledged and availed of on both sides. (See *SUBCONSCIOUS*.)

The miscellaneous group of investigations supported by the psychical research interest adds little to its content, but sustains its relation to current beliefs and practices. Their study has contributed to the history and anthropology of the belief habits of mankind. There may be mentioned the study of the divining rod, of other types of "sensitives," of "poltergeists" and haunted houses, of collective hallucinations, of theosophical and similar marvels. Of different temper is the very valuable study of the sources of error in reports of and beliefs in supernormal phenomena,—the psychology of the sitter in the séance, of deception, of prepossession, of credulity, of fraud, and of fanaticism.

While the net issue of this vast labor seems proportionately slight and the supporting interest detracts from the sturdier and more systematic pursuit of psychology, and while

Fig. 7.

APPARATUS FOR THE PSYCHOLOGICAL LABORATORY.

PSYCHOANALYSIS

the eager straining for results corroborative of traditional beliefs seem to many equally illogical and undesirable, the indirect service performed by psychical research should be recognized even though the untoward tendencies are deplored. The division of opinion in point of view, interpretation, and conclusion appears conspicuously in the literature, both among the contributors to psychical research and among academic psychologists. PSYCHOANALYSIS — A method used in the investigation of mental disorders, depending upon the arousing of associations (*q.v.*) which have been dormant, and upon the discovery of the beginnings of the abnormal mental state. Many of the disorders of mind (see INSANITY) are known to arise from fright and other emotional excitations in childhood. These lead to altered reactions, and by psychoanalysis attempts are made to trace the genesis of the disorders. The method has a psychotherapeutic value in that the analysis leads to explanations and reconstruction, which in turn produce better views of life and more normal reactions (see PSYCHOTHERAPY). B. I. F.

PSYCHOLOGICAL LABORATORY, EQUIPMENT OF. — The psychological laboratory usually consists of a series of rooms rather than a single large room, isolation being an important factor in psychological experimentation. Of these rooms it is desirable that one should be dark, for purposes of experiments in vision, and that another should be soundproof for experiments in hearing. All rooms should be furnished with the electric current and with some means of readily reducing and varying the current. Various methods of varying the current are used. The most satisfactory method, apart from the expense involved, is the use of a sufficient number of transformers. A less expensive initial

PSYCHOLOGICAL LABORATORY

outlay is required for the Scriptura lamp batteries, Fig. 1. In these the current is made to pass through the lamps at A before being drawn off at C, thus reducing the current. The small lamp B, placed in parallel with the apparatus, serves to eliminate the spark when the apparatus circuit is broken. (See Judd's *Laboratory Equipment for Psychological Experiments*, pp. 4-5.) Another simple form of resistance is described in Titchener's *Experimental Psychology, Students' Manual, Quantitative*, p. 128. It is also desirable that a psychological laboratory should have a compressed air supply, running water, and gas. A dark room for photographic purposes and a workshop equipped with lathe and other machines for working in metal and wood are valuable adjuncts to the laboratory.

The following is a description of some of the most important pieces of apparatus and of the uses to which they are put. —

Kymograph (Fig. 2). This is a clockwork device for revolving a brass cylinder or drum. The apparatus is usually so constructed as to make it possible to use the drum in either the horizontal or the vertical position. The speed at which the drum revolves may be varied to suit the needs of the experiment. The drum, which is detachable, is covered with a band of glazed paper and revolved over a gas or other flame, which leaves a deposit of soot upon its surface. This makes a convenient surface for all sorts of graphic records. After the record is made, it may be preserved by passing it through a solution of shellac which hardens the surface. If a longer record is desired, a second drum, mounted on a carriage, may be used, and a belt of glazed paper of any desired length may be stretched between this and the drum of the kymograph. Under such conditions the shellac is applied to the inner side of the paper.

The tambour (Fig. 3) is an instrument for making records of movements upon smoked surfaces such as have been described. The hollow bowl is covered by a thin piece of rubber and communicates by means of a piece of rubber tubing with a similar bowl detached from the rest of the apparatus. Any movement in the rubber surface of the latter is communicated to the rubber surface of the former. This surface is attached to a light lever at a point not far from the fulcrum, and a metallic point at the other end records the movement thus magnified upon the smoked surface of a drum. A single tambour may be used in conjunction with the sphygmograph (Fig. 4), which in the form represented in the figure is merely a special kind of tambour for registering the movements of the radial pulse.

The plethysmograph (Fig. 5), which registers changes in the volume of blood in the arm, is also used in conjunction with a tambour. The arm, covered with a rubber sleeve, is inserted in the cylindrical chamber, and the

rubber sleeve is fitted over the end of the cylinder so as to make it watertight. The chamber is then filled with water, which rises in the glass tube to any desired height. The glass tube is connected with a tambour. The height of the water in the tube varies with changes in the volume of the arm, and these changes are thus registered by the tambour.

The pneumograph (Fig. 6) is a steel spring covered with rubber, thus making an expandible air chamber. When bound around the chest or abdomen, the breathing movements may be recorded with the aid of a tambour.

More complicated forms of apparatus make use of the principle of the tambour for the recording of movements. Figure 7 shows such an apparatus designed to record finger movements in three dimensions. Figure 8 shows a similar device for head movements.

The planchette is an instrument for recording involuntary arm movements. It consists of a narrow board, suspended by cords and adjustable to any required height, upon which the arm rests. One end of the board is provided with a steel pen which is allowed free play through a hole in the board and writes upon the surface of the paper below, thus recording all horizontal movements of the arm.

Various forms of apparatus are used for measuring work. The simplest form is the dynamometer shown in Fig. 9, which consists of a steel bow which is placed in the hand and compressed. The amount of pressure is indicated on the graduated disk.

The best known form of ergograph, or work measurer, is that of Mosso, shown in Fig. 10. A string passing over a pulley holds the weights and is attached at the other end to the finger of the subject to be tested. The remaining fingers and arm are securely fastened to the arm rest so as to isolate the work of the one finger. A recording point moves with the string over the surface of a revolving drum. The amount of work done is computed by multiplying the total height of these movements by the weight lifted.

The time relations of various processes may be measured by the use of an electrically driven tuning fork (Fig. 11). These forks are made with any desired frequencies, e.g. 100 vibrations per second. The fork is mounted upon a wooden base and a magnet is placed between the prongs of the fork. One of the prongs of the fork is provided with a spring with a platinum point, which rests against an adjustable button. An electric current is passed through the fork by attaching the wires from the source of supply to two binding posts, only one of which is shown in the figure. The current passes through the prong of the fork to the spring and button, thence through the coils of the magnet, and out at a second binding post. When the current passes through the magnet, the prongs of the fork are drawn inward and the contact of the platinum point

with the button is momentarily broken, thus interrupting the current through the magnet and allowing the release of the prongs outward, thereby affording a second connection between the spring and button, when the process is repeated in a similar manner. In this way there is a continuous breaking and making of the current, and the fork is made to vibrate continuously at its proper rate. By adjusting the fork in such a way that the recording point at the end of the prong of the fork moves upon the smoked surface of a revolving drum, a time record is obtained in the form of curves, each of which indicates a time period of the same duration as one vibration of the fork. The time of any process recorded simultaneously with the vibrating fork upon the drum may thus be obtained. The lower curve of Fig. 12 is such a time line, the upper curve being a pneumograph record taken simultaneously. Other means of obtaining a standard time record are the Jaquet chronometer and the electric contact clock. The former (Fig. 13) is essentially a stop watch with a recording point beating seconds. By a different adjustment it may be made to beat at the rate of five per second. The electric clock (Fig. 14) makes and breaks an electric current at a rate which varies from once a second to once in twenty-four hours, according to the adjustment.

In all cases where the time record is obtained from the making and breaking of an electric current it is convenient to use an electric marker (Fig. 15). This instrument consists of a pair of bar magnets, which are placed close to a spring. The spring is pulled towards the magnets at any moment when the current passes through them. As soon as the current is broken, the spring is released and pulled away from the magnets. The moving spring is attached to a recording lever. Such a marker, when placed in circuit with an electric fork or any other electric current which is made and broken at a known rate, serves as a convenient means of making a time record upon the smoked surface of a drum. The electric marker is also used in many other connections, as, for example, in the reaction experiment, where it is necessary to know the exact moment when a certain activity takes place. In the reaction experiment an electric contact key, of the type shown in Fig. 16 is used. When the finger presses down the spring of the key, the current is made. The moment the finger releases the spring, however, the current is broken. Such a key, when placed in the same circuit with an electric marker, gives a method of recording the moment at which the finger movement takes place.

Figure 17 shows a form of apparatus the principle of which is useful in the measurement of a number of the optical illusions. The figure shows the form used in connection with the Müller-Lyer illusion. The drawing of the lines is made upon two separate pieces of cardboard

APPARATUS FOR THE PSYCHOLOGICAL LABORATORY.

which, when placed together, one overlapping the other as in the cut, form the Müller-Lyer figure. One of these cards, *D*, is fastened to the immovable base of the apparatus. The other is attached to the slide *C*. The subject adjusts the slide so as to make the two horizontal lines appear equal. The amount of error, i.e. of the illusion, may be directly measured or it may be recorded upon the tape *T* and measured later.

Figure 18 is a color mixer. Colored disks may be slit and placed together so as to show any desired proportion of the various colors to be mixed. (See Fig. 19.) When these are fastened to the arbor and the wheel is revolved, the speed of revolution is so greatly increased as to cause fusion of the colors, giving rise to the phenomenon of color mixture. A more convenient form of color mixer consists of an electric motor capable of a speed rapid enough to produce fusion of the colors.

Several forms of the stereoscope are to be found in psychological laboratories. The drawing of Fig. 20 shows the construction of the Wheatstone mirror stereoscope. Two mirrors (*3* and *4*) are placed together at an angular position which may be varied to meet the needs of the experiment. The pictures or drawings to be fused are placed upon the upright boards (*1* and *2*), the distance of which from the mirrors is also adjustable. The apparent position of these pictures is behind the mirrors. The lens stereoscope is so well known as to need no description here. The stereoscope may also be used for the demonstration of retinal rivalry.

Figure 21 shows the principle and construction of a simple form of pseudoscope. It consists of a box with three openings at *A*, *B*, and *L*. In front of *B* is a mirror, *M*, placed at an angle of forty-five degrees with the side of the box. Parallel to this mirror is another mirror *M'* in the corner of the box next to *A*. If the left and right eyes are placed at *A* and *B*, respectively, the left eye sees any object such as *D* straight ahead, while the right eye will have an object occupying a position such as *O* reflected to it by the two mirrors. The relation between the two eyes is thus reversed and a pseudoscopic effect produced, i.e. solid objects appear hollow, and hollow objects, solid. If the openings *B* and *L* are used for the left and right eyes respectively, it has the same effect as if the eyes were at a much greater distance apart than is actually the case. When used in this way, the instrument is known as a telestereoscope.

The stroboscope (Fig. 22) consists of a cylindrical device with slits through which the observer looks at pictures of successive phases of a scene involving movement of any kind. When the stroboscope is revolved rapidly, the pictures are exposed in rapid succession and fused so as to give the perception of movement.

The color perimeter (Fig. 23) is for the pur-

pose of testing the character of indirect vision. The subject seated at the center of the arc gazes directly in front of him with one eye, the other being covered, and notes the qualities of colors appearing at various points of the arc. Under these conditions the colors fall upon the non-foveal regions of the retina, any point of which may thus be tested as to its sensitivity to the particular color used.

The tachistoscope (Fig. 24) is an apparatus for making short exposures of words, figures, etc. A falling slide is released by a magnet, thus momentarily revealing the exposure field. The time of exposure may be regulated by the height of fall of the slide.

Figure 25 represents the auditory cage, which is used for investigating the properties of auditory space. The subject is seated within the cage, the two ears being at equal distance from the rim *A* and at the same height. Some source of sounds, such as a telephone, is attached to the rim and may be moved any desired distance by revolving the apparatus. The distance may be read off at *R*. Two telephones may also be used, and the effect of fusion when they are placed at various distances from the ears may be thus determined.

The simplest method of producing tones is by means of tuning forks and resonators. Figure 26 represents two forks of the same pitch, one of which, however, is adjustable in pitch by means of weights which can be placed at varying distances from the end of the prongs. By comparing the tones of the forks just noticeable differences in pitch may be tested. Another simple means of tone production is by the use of a set of Quincke's tubes (Fig. 27), consisting of two glass tubes held together by a wire. The tube *B* is the mouthpiece and *S* is the sounder, the latter being closed by a cork. The highest audible tone is determined by Galton's whistle (Fig. 28). By pressing the rubber bulb the air is forced into the small tube *D* and against the tip of *E*. The length of the air column in *E* is regulated by the graduated screws *G* and *F*, and the rate of vibration is determined by the amount of turning of these screws. The lowest audible sound may be found by the use of simple rods held firmly in a vise and lengthened until the limit of audibility is reached.

The apparatus shown in Fig. 20 is designed to determine the threshold of just perceptible difference in sound. Two pendulums with hard rubber balls at their ends may be dropped from any desired height against the obony block at the base of the apparatus. The distance may be read off from the graduated area. The pendulums are set in motion successively from slightly different positions, the distances being varied until the point at which the just noticeable difference of the two sounds is reached.

Figure 30 represents the aesthesiometer, for

determining the spatial threshold of the skin. The hard rubber points may be separated at any distance, which can be read off on the scale. The shortest distance at which these points may be placed apart and yet be distinguished as two rather than one is regarded as the spatial threshold for the region tested. Blunt metallic points are used for exploring the skin for warm and cold spots. The sensitivity of the skin to touch may be tested by an instrument like that in Fig. 31, which employs a hair the length of which is capable of being varied. The shorter the hair the stiffer it is, and hence the greater the pressure exerted.

PSYCHOLOGICAL TENDENCY IN EDUCATION

—The term recently applied to that general tendency in education during the nineteenth century which stressed the importance of the knowledge of the child rather than a knowledge of the subject-matter as the basis of all teaching. The movement began with Rousseau (*q.v.*), who promulgated the doctrine that the child is the center of education. It was made more definite and reduced to schoolroom procedure by Pestalozzi (*q.v.*), who showed that education is a natural evolution of the child's nature. It was given a scientific formulation by Herbart (*q.v.*), and a philosophical by Froebel (*q.v.*). Both Herbart and Froebel had also tremendous practical influence on school work,—an influence which was in all its details but a practical exemplification of the fundamental belief given common expression by this term "psychological tendency." The latest phase of this tendency is seen in child psychology and the applications of experimental psychology to education. For the details the reader is referred to these various articles, on CHILD STUDY, CHILD PSYCHOLOGY; also OBJECT TEACHING; PSYCHOLOGY, EDUCATIONAL; FROEBEL; HERBART; PESTALOZZI; ROUSSEAU; TEACHERS, TRAINING OF.

PSYCHOLOGY. — **History.** — Psychology as a science is of relatively recent date. The earlier treatments of the subjects that are now included in psychology were of a metaphysical and speculative type. Thus the Greeks were always interested in the nature of the mind, in its origin, and in its relations to the world, but their treatments of these topics were of a broad speculative type. They described the mind as perpetual in its existence. Plato, for example, held that human conscious-

ness in its present form is merely a carrying over of certain types of existence that have appeared in other forms in earlier ages, and will appear again in other forms in subsequent worlds. Again, the question of the distinction between mental reality and material reality was vigorously discussed during this earlier period. During the medieval or later speculative period the interests were chiefly theological and related to the soul and its functions. The immortality of the soul was very fully discussed, its unity and its relation to the world were also topics of engrossing attention.

During these earlier periods there are to be found at times descriptive accounts of consciousness which foreshadow the later developments of scientific psychology. Thus to cite a single conspicuous example, Aristotle wrote on memory, and by his accurate account of its operations laid the foundation for the later doctrine of the association of ideas. He described very fully the processes of memory which depend upon similarity, contiguity, etc.

With the beginning of the modern period, the metaphysical interest merged at times with purely scientific discussions. Thus, Descartes while writing upon the nature of reality was led to discuss the relation between the physiological organism and conscious processes. He gave an account of the nature of the reflex process, and discussed the question of the presence of consciousness in animals. Descartes developed the doctrine that the soul because of its unity must be seated at some point in the central nervous system which is not bilateral in its structure. He found such a point in the pineal gland, and was led therefore to regard this as the seat of the soul.

Scientific interests eventually superseded the metaphysical interests and led to the development of an independent science. Three major lines of development have contributed to psychology in its present scientific form. First, descriptive accounts of conscious processes became more numerous and exact with the development of modern thought on the subject of consciousness and its elements. The English school of psychologists has made a very large contribution to this type of psychology. Beginning with John Locke (*q.v.*), a whole group of psychologists described in detail the experience through which they passed in the perception of objects, and in the formation of ideas. This English school laid great emphasis upon the laws of association and has sometimes been described as the English Association School. In Germany a group of writers following upon Christian Wolff (*q.v.*), who wrote in 1732 his *Psychologia Empirica*, and in 1734 his *Psychologia Rationalis*, gave a very great impetus to a detailed description and discussion of mental processes. Tetens (1776-1777) furnished a classification of mental processes which has long done ser-

ice in psychology. This classification became current through its adoption by Kant. It distinguished the processes of knowledge, feeling, and volition. This classification of mental activities continues to be used in all of our current discussions, and is very satisfactory as a first descriptive classification of the facts of mental life.

A second general type of scientific development, which has contributed to modern psychology, appeared at first as physiology of the senses and central nervous system. In the first half of the nineteenth century, a number of writers became interested in the detailed examination of the various senses. E. H. Weber published a series of treatises on the skin sensations and organic feelings, dealing with the problem from the point of view of the practical student of physiology and medicine. Indeed, the motive which Weber had for his investigation was the desire to develop a method of diagnosis through the measurement of the sensitivity of the skin. (See Wenzel's Law.) Later, Lotze published a volume entitled *Medizinische Psychologie oder Physiologie der Seele* (1852) in which he attempted to account for mental phenomena, especially abnormal mental phenomena, by a study of the physiological organism, and the relation between the activities of this organism and the mind. These earlier contributions were brought into systematic form by Wundt in his great work *Grundzüge der physiologischen Psychologie*, the first edition of which appeared in 1874. In 1887 Ladd's *Elements of Physiological Psychology* appeared in English, and marked a departure from the traditional form of psychology that had been current in this country before. The earlier psychologies had conformed very closely to the English association type of thinking, and had included many of the speculative metaphysical and theological discussions of the earlier period. Even Ladd's book contains many philosophical passages.

The third general type of scientific investigation which contributed to modern psychology is very closely related to the physiological studies above described. It arose from the development of experimental methods in psychology. Certain early experiments were undertaken in astronomy for the purpose of determining the personal equation. In 1795 the British Astronomer Royal found that his own records did not agree with those of others in the Observatory. He is said to have attributed the discrepancies between his own observations, and those of others, to errors on the part of his assistants. It was not until later, in 1820, that Bessel noted that his own observations differed in time from those of other equally competent observers. He undertook some experiments to determine the exact amount of these personal differences in observations. Such exact determinations of reactions opened up a field for experimental investigation

which was very fully cultivated by the early students of experimental psychology in the last two decades of the nineteenth century. A great number of reaction time experiments (*q.v.*) under various conditions were worked out by these experimentalists.

A somewhat different type of experimental investigation was undertaken by G. T. Fechner, who reported in his *Elemente der Psychophysik*, 1860, his measurements on the differences between sensation intensities and their relation to external stimuli. He also worked out elaborate mathematical calculations in conjunction with these measurements (See WENZEL'S LAW). In the meantime, Wundt was working on certain experimental measurements of the accuracy of space perception which he published in his *Beiträge zur Theorie der Sinneswahrnehmung*, 1862. Helmholtz had also made extended investigations upon optics and sound sensations, which included both experimental work and physiological studies. His *Physiologische Optik* and his *Lehr von den Tonempfindungen* appeared before 1862. These various investigations made it perfectly clear that accurate knowledge of mental processes, and the relation of mental processes to physical and physiological facts, can be secured only through careful and systematic observations carried on under well-controlled conditions.

The enthusiasm for physiological and experimental investigations in psychology was at first so great that a certain antagonism between these investigations and the older types of descriptive psychology seemed to develop. Many writers held that descriptive psychology was entirely superseded by physiological and experimental investigations. Psychological laboratories were established in German universities and in this country, the first being Wundt's laboratory in the University of Leipzig, established in 1878. Definite reaction against the subdivision of psychology has, however, in recent years made itself apparent. The descriptive writings of the earlier workers have been appealed to for much of the material which is to-day employed in suggesting and carrying out psychological experiments. The experimental methods, on the other hand, have been utilized to refine in all directions the observations of mental processes, and the physiological facts have been drawn upon very freely to supplement and support psychological studies. A general science of psychology strictly empirical in type and scientific in its method has emerged from the conflicting tendencies of the latter part of the nineteenth century.

No mention has yet been made of one of the writers who is of great importance in education, namely, Herbart (*q.v.*). Herbart's place in psychology is by no means as important as his place in education. His psychology was an effort to throw the descriptive accounts of

his predecessors into the form of a series of mathematical equations. He explicitly attempted to develop a system of mechanics of the mind. This he did without experimental or physiological investigations, and the result was merely a series of abstract symbols expressing in obscure formulas the observations which had been set down by his predecessors in much more available descriptive terms. Furthermore, Herbart's psychology was based upon certain philosophical assumptions which are wholly unproductive for the empirical science. When Herbart discussed pedagogical problems, he showed a degree of familiarity with descriptive psychology which is only inadequately reflected in the abstract system which appears in his books on psychology proper. He undoubtedly did psychology and education the great service of bringing these two sciences into closer relation to each other, but he made no vital contribution to the science of psychology itself, except as he promoted the general descriptive movement and added enthusiasm for scientific method.

Present-day American psychology owes much to German influences. Wundt has trained many of the leading Americans now at work in this field. One American psychologist who deserves to be mentioned as a leading contributor to the modern sciences is William James (*qv*). In 1890 there appeared two large volumes entitled *Principles of Psychology* from this writer, which contained new and stimulating discussions of habit, emotion, instinct, and various phases of sense perception and thought. So stimulating are the general discussions by James that he must be recognized as the leading influence in current American psychological discussions. His emphasis upon activity as one of the major conditions of mental development, his conceptions of the nature of emotion and habit, are among the leading doctrines which he contributed to education. His small volume, *Talks to Teachers on Psychology*, has had a very wide recognition, and lays great stress upon behavior as the fundamental conception in any treatment of educational psychology.

A movement which at one time promised to be of the greatest importance in educational psychology was the Child Study movement, largely initiated by C. Stanley Hall. (See CHILD STUDY and PSYCHOLOGY, GENETIC.) This movement lacked for the most part in definite guiding principles, and while it led to the collection of a large amount of material with regard to children's habits and activities, it has never developed into a system of educational psychology. It does not, at the present time, give promise of any separate existence as a branch of psychology. The current tendency is to work out the problems of education by experimentation and description, and to subordinate educational psychology to the general science.

Numerous efforts have been made to epitomize psychology for the use of teachers, or to make special applications of certain leading principles. The general literature of psychology can be found in the *Psychological Index* published annually by the *Psychological Review*. This reports both the general treatises and the special articles on all of the subjects of this science. The system of classification adopted in the index is one in general use in European publications as well as in this American publication.

The science of psychology may be subdivided in a great variety of ways. Practical interests dictate the separation of animal studies from the studies of human consciousness and human behavior. Further practical motives have emphasized the importance of child study as distinguished from the study of adult consciousness. The result is the appearance of works on animal mental life, child mental life, and adult human life. Abnormality of all sorts is studied in the special subdivision of psychology known as psychiatry. Many of the special social sciences seek a psychological foundation. Thus, there may very properly be an introductory psychological chapter to all studies of language and studies of art. The special psychology of observation as bearing upon the validity of legal evidences is another special topic which has led to a natural subdivision of general psychology. Any social study may, therefore, lead to a subdivision of the subject matter of the science of psychology. The general principles of all social organization may also be brought together under social psychology (*qv*).

The methods of psychology suggest another line of cleavage. Genetic psychology is that phase of the science which deals primarily with mental development and evolution. Experimental psychology, on the other hand, is that phase of the science which elaborates the experimental technique. Experimental psychology studies especially such matters as the rapidity and character of reactions (see REACTION TIME EXPERIMENTS), and various forms of perception (see PERCEPTION, SPACE, TIME) and memory (*qv*). These topics obviously would be held apart if practical interests were consulted, but from the point of view of methodology they are brought together as capable of experimental attack. Descriptive and explanatory psychology are contrasted with genetic psychology and experimental psychology, as types of psychology depending upon the special methods implied in the two names.

The phase of psychology which is most likely to be of interest to educators has usually been designated as educational psychology, and is discussed in a subsequent section.

Genetic Psychology.—That branch of psychology in which mental development and mental evolution are the chief subjects of

treatment. The term has sometimes been used in a restricted sense to cover merely studies of mental development in children. In such a restricted sense, it is the synonym of child study (*q.v.*). In a broader sense, the term should cover animal psychology (*q.v.*) and also those aspects of human psychology which deal with mental change, whether in the child or the adult. The discussion of mental evolution involves the consideration of the nervous system and its evolution. The term genetic psychology may, therefore, very properly cover studies of nervous evolution and development. (See *GENETIC METHOD*.)

The first and most general problem of genetic psychology is to determine whether mental processes differ from each other qualitatively or merely quantitatively. Thus, is human consciousness of the same type as animal consciousness, merely differing in the number of elements and experiences involved, or is there a fundamental difference in type? The latter is undoubtedly the popular view. Man is said to have reason and abstract intelligence, while the animals lack these higher powers. Descartes, as an early exponent of this view, asserts that animals are pure mechanical automata. The bodies of animals are animated, but soulless. Man, on the other hand, has a rational soul, and hence is different from animals. With the rise of the evolutionary doctrine, such a view as that of Descartes became very difficult to accept. The animals have nervous structures like our own, and they have sensory experiences like our own; they seem to learn by experience and to readjust their activities through contact with the world.

It being also in keeping with the general spirit of the evolutionary doctrine to seek continuity in the world, there has been of late a strong tendency to break away from the view of Descartes and the common man, and to assert that human consciousness is of the same type as animal consciousness except that it is more elaborate. A notable exposition of this view is to be found in the work of Ribot (*Evolution of General Ideas*, Chicago, 1899), in which it is held that the germs of all of the higher forms of abstraction are present in the animal perception.

Wundt's position in the matter is set forth in the *Outlines of Psychology* (p. 313) as follows: "If we try to answer the general question of the genetic relation of man to the animals on the ground of a comparison of their psychical attributes, it must be admitted . . . that it is possible that human consciousness has developed from a lower form of animal consciousness . . . Still, we must not overlook the fact that between the psychical attributes of man and those of the animals . . . there are differences much broader than the differences in their physical characteristics."

There can be no doubt that biological continuity of animal evolution has been fully

established on the physical side. There can be no doubt also that there are common elements of mental life in animals and men. Whether the evolutionary relations of consciousness are best set forth by emphasizing continuity may be doubted. Before the doctrine of evolution was formulated there was need of attention to the relationship between man and the animals. The problem now before science is the problem of explaining how man has come to be so different from the brutes. Man has eyes and ears like the animals, but he has a totally different set of ideas and hopes. Man is a creature of ideas, of language, and inventions. He has turned into a new path of evolution, and this new path is the most interesting subject which science has to take up in its study of man. Hobbouse, in his *Mind in Evolution*, has drawn attention to the principle that evolution becomes progressive in the degree in which it brings mental adaptation to the front and substitutes this for purely natural selective change.

The general evolutionary problem outlined above resolves itself into a number of minor problems. Thus we are led to inquire what are the instincts (*q.v.*), and what their origin? What is the relation of instinct to habit (*q.v.*)? What is the origin and evolution of language (*q.v.*)? What is the evolution of the arts, of abstract thought, of systems of science, such as number science? For the student of education, these detailed studies of mental evolution are more directly applicable to the problems of the school than the more general discussion of evolutionary principles. Indeed, the problems may very profitably be subdivided still further. Within the general problem of the development of language, two separate problems, one relating to writing, and one relating to reading, may be worked out with a direct view to answering many of the practical questions of school organization and instruction. This is not the place to summarize in detail the results of such genetic studies, but in order to illustrate further the genetic method, certain general results of such studies may properly be presented.

Mental development does not go forward at a uniform rate, sometimes it is rapid, and at other times it is slow. Thus, one acquires words in learning a foreign language at first very rapidly, and later at a much slower rate. In learning to make a movement, one often improves at first very rapidly, later, more slowly. In mastering certain systems of scientific thought, one progresses at first slowly, until a few fundamentals are mastered, whereupon later progress is more rapid. These examples serve to make clear the necessity of a more complete examination of all the types of mental development with which the school has to deal. If the parts of arithmetic where rapid progress is usually made could be sharply contrasted with the phases of arithmetic in

which progress is slow, then school work could be more economically organized.

A second principle of genetic psychology may be formulated as follows: there are certain hierarchies or levels of mental activity. Before one of the higher types of activity can be perfected, the elementary activities entering into it must be perfected (see LEANING). Thus mathematical manipulations involve certain elementary processes, such as addition, subtraction, etc. The mastery to some degree of the elementary processes is essential to the perfect development of the higher process. Here, again, there is a rich field for educational research. It is not obvious in certain types of mental activity, as, for example, reading, what are the lower elements. It was assumed at one time that the letters must be completely mastered in order that one might read fluently. To-day there is much skepticism as to the necessity of learning the alphabet as a preliminary to learning to read. It is a problem of genetic psychology to study reading until the elementary phases of reading can be defined.

A third position which has been stoutly defended in genetic psychology is that which holds that activity is at once the goal and the motive of all mental development. The psychology which existed before the evolutionary doctrine was advanced, described mental life very largely from the point of view of adult introspection. In the adult mind, those experiences are most obvious which arise through meditation and comparison of ideas. The result was that mental life was treated for the most part as an aggregate of ideas and forms of meditation. As soon as psychology was forced to take up the broad study of all levels of mental activity, it became evident that meditation is not the typical, and certainly not the final, stage of conscious activity. All consciousness, even that of a meditative type, issues in behavior. Hence, genetic psychology has put even the more elaborate forms of mental activity in an entirely new light with respect to their origin and development.

A final principle of genetic study, which is of very general importance to education, may be stated thus: Many processes which are present at lower levels of mental development tend to disappear at higher levels. This may be called the principle of negative education. A good physical analogy appears in the fact that an infant's feet are capable at first of movements closely related to the grasping movements of the hands. Later, by virtue of the changes in the structure and control of the feet, these organs become specialized, and give up their powers of activity as organs of prehension. An example of the same type taken from the sphere of sensory experience is seen in the fact that an infant always seeks to become acquainted with new objects by

carrying them to his mouth. Again, he always reaches for bright objects, including the fire. Later, he learns to get his sensory experiences in a more economical way. As a final illustration, one may cite the fact that arithmetical methods are superseded by algebraical. The race has repeatedly given up elaborate methods of thought and procedure in favor of new discoveries. The Roman numerals were given up for the Arabic. These examples suggest the importance of organizing educational processes, so that they shall require as little as possible of abandonment of earlier forms of activity, while at the same time they make it perfectly clear that there must be some negative education.

Functional Psychology.—The term was first brought into prominence by Titchener, who, using the analogy of anatomy and physiology, called attention to the possibility of treating consciousness from either the structural or functional point of view. When one analyzes consciousness into its constituent elements, as, for example, when one analyzes his consciousness of a book into sensations of black, white, color from the background, shadows, etc., the interest is primarily in the structure of mental life. When, on the other hand, leaving this minute analysis, one inquires how a certain conscious state will affect the future behavior of the individual, he is considering the way in which consciousness operates, or its functions. Titchener, in his discussion of the matter, points out that analytical study is purely scientific in its interests and results. Analysis has the foundation for applications, but is not itself practical. If we are to have applied psychology, we must go beyond analysis and understand functional relations. Functional study is, however, a late product in any science, and must, according to Titchener's view, wait upon the completion of structural analysis.

There can be no doubt that Titchener is right in his position that education is in need of a functional psychology before the practical problems of the schoolroom can be solved psychologically. Thus, to take a concrete case: the child who is learning to write has a complex conscious experience into which enter such elements as the following: visual sensations from copy, blank paper, sight of fingers, pen and general surroundings; auditory sensations from the teacher; tactual sensations from his hand and arm; muscle sensations from his fingers, hand, and arm; a mass of bodily sensations, an admixture of feelings, desires, and resolutions. To analyze the child's mental complex into these elements is undoubtedly legitimate scientific procedure. The teacher is left, however, at the end of the analysis with very little practical assistance. Suppose, by way of contrast, we dwell upon the fact that the best way for the child to write is to begin with a study of the visual

pattern, and that later some rapid writing will force him to become fluent, if not exact, in his execution; we are dwelling upon principles of behavior rather than upon analyses of structure. Principles of behavior are very often much less exact than the results of analysis, and the explanation of behavior is often much less complete than the statement of the cause of a structural element of consciousness.

If the elements of consciousness are its important factors, then we are grossly neglectful in our common disregard of taste and odors. Indeed, some structuralists have seriously argued that schools should introduce exercises which will train children's noses. Are not the odors which come to us as numerous and varied in quality as our other sensations? Let us cultivate the power of dwelling upon them. To the functionalist, this is absurd. The sensory element is of value only when it guides in behavior. The odors which come to the human nose are of relatively little value as compared with the visual sensations which come to the eye, when behavior is under consideration. Therefore, the functionalist faces with perfect equanimity the common neglect of odors, and the great emphasis upon vision. What is the functional value of an impression? is the functionalist's question. What is the impression? is the structuralist's question.

There can be very little doubt in the mind of the partisan functionalist that one of the reasons why teachers have learned so little from psychology is that this science has been predominantly structural in its interests. The analysis of consciousness into its elements has very little connection with the practical work of guiding mental development. In contrast with mere structural studies, the work of such a writer as James is broad in its interests and illuminating for the educator, as well as for the student of technical psychology.

C. H. J.

Structural Psychology. "The contrast is really between two aspects, in which all mental facts without exception may be taken; their structural aspect, as being subjective, and their functional aspect, as being cognitive. In the former aspect, the highest as well as the lowest is a feeling, a peculiarly tinged segment of the stream. This tingling is its sensitive body, the *un ihm zu Mithel ist*, the way it feels whilst passing. In the latter aspect, the lowest mental fact as well as the highest grasps some bit of universal truth as its content, even though that truth were as relationless a matter as a bare unlocalized and undated quality of pain. From the cognitive point of view, all mental facts are intellects. From the subjective point of view, all are feelings." These sentences, which were written by James in 1881, and in which, so far as the writer is aware, the two "aspects" of mind first receive their current titles, may

serve as text for a discussion of structural psychology, and of its relation to other departments of psychological work.

In commenting upon them, we remark (1) that James identifies functional with cognitive psychology: the restriction, however, seems to be due to context and not to deliberate purpose. Structural psychology is, in fact, to be distinguished, on the one hand, from any form of psychology which posits and explains intrinsic mental function, whether cognitive, intentional, or other; and, on the other hand, from any form of psychology which attributes to mind an extrinsic function, such as that of organic adaptation, of the resolution of "nervous tension," and so forth. For structural psychology, mind does not "act"; it exists in time, or "goes on."

We remark also (2) that the phrases "sensitive body," "the way the mental fact feels whilst passing," are, as they stand, ambiguous. For structural psychology is far removed from a mere phenomenology that should take consciousness, so to say, at its face value. The task of structural psychology is exact description; and description implies analysis and synthesis, the passing experience is held up, repeated, cleared of entanglements, in order that its elementary components may be teased out, and the pattern of their arrangement noted. A distrust of conscious appearances, and a systematic recourse to experimental methods, thus mark off structural psychology from the "pure psychology" of an earlier day.

In sum, then, structural psychology tries to give an exact description of mind *sub specie aeternitatis*, in contradistinction to psychology which endow mind with objective reference or which regard it as instrumental. The sources of error are of two kinds, external and internal. (1) Structural psychology is closely related on the one hand to functional psychology, and on the other to psychophysics, and there is danger that the results of the neighboring sciences are uncritically accepted. It is all too easy, e.g., to translate a function, or the phase of a function, forthwith into structural terms; and since functional psychology is itself poised between logic (or theory of knowledge) and biology, and sometimes loses its proper balance, a psychology of structure may be affected, indirectly, by those remoter influences. It is tempting, again, to include in structural psychology facts that in strictness belong to psychophysics, such as the stimulus and differential lucens, and if in this case the outcome is less disastrous, the error, in the interest of clear thinking, is no less to be avoided. (2) The internal sources of error are, in the main, of a methodological sort. The method of structural psychology is, of course, direct observation, i.e. introspection; and until we know the mechanism of introspection, its scope, limits, pitfalls, conditions, and what not, we cannot be sure

of the reliability of our results. In certain fields, as in that of sense perception, the mechanism of introspection is fairly well understood; in others, however, there is still a wide difference of opinion as to precisely what is done when the method is employed. The question is now under debate, and its clear formulation is the best guarantee of a satisfactory answer.

If, as Ebbinghaus has done, we seek an analogy to psychology in the sciences of life, we may say that structural psychology corresponds to gross and fine anatomy, only that it is an anatomy of living, not of dead tissue. Its *raison d'être* is that of exact description in science at large, and its relative inimportance will, therefore, be variously estimated according as the individual psychologist lays stress upon description, upon causal explanation, or upon teleological interpretation. For the rest, structural psychology is not incompatible with any other department of mental science. Genetic psychology, *e.g.*, may be either functional or structural, and should rightly be both. Functional psychology stands to structural as physiology stands to morphology; there is no reason for antagonism between them. Structural psychology, again, may seek its explanations in physiology, or in the subconscious, without violation of principle. Indeed, the accepted results of structural psychology are, as all students of psychology know, turned to the most varied account in current psychological systems.

E. B. T.

Teaching of Psychology -- In American Universities -- University courses are usually divided into three grades. (1) an elementary course, (2) special lecture and laboratory courses, and (3) training in research.

The elementary course is ordinarily given in the sophomore year and runs from three to six semester hours. It is one of the most favorite electives. There are two tendencies in mode of approach, namely, the *structural* and the *functional* (*q.v.*); but usually the two methods are combined. The so-called self-psychology (*e.g.* Calkins') has been advocated as a third mode of approach. Lectures, textbooks, and experimental methods are usually combined. The lectures are, as a rule, not primarily informational, but serve rather as a guide and stimulus to the student in obtaining information from other sources. The textbook, though freely employed, is seldom used as the basis for oral recitation. The experimental work takes three forms: (a) the demonstration lecture, (b) individual experiments without technical apparatus, and (c) "class experiments." The tendency in the best teaching is to reduce the demonstration lectures to a minimum on the ground that they do not cultivate self-expression in the student. The attempt to take the student into the technical laboratory for elementary instruction has failed, mainly because the student is confronted with two problems, the

apparatus problem and the psychological problem, and the former usually proves too much of a distraction. The beginner's energies must be conserved for the grasping of the psychological problem by itself. The individual experiment conducted outside of the laboratory by such simple means as may be readily available saves the unfolding of elaborate laboratory equipment, frees the student from concern about difficulties in the manipulation of complicated apparatus, conserves his energy for the grasping of the psychological problem, and saves time. The following requirements are typical. Secure the following conditions: (1) make the experiment intensive, "one thing well"; (2) use only such apparatus as may be at the disposal of the student, or can be supplied freely by the instructor, *e.g.* paper, pins, cards, corks, watches, etc.; (3) supply full and specific directions with the necessary preliminary statements for orientation; and (4) follow each set in the experiment with printed explanation, interpretation, further suggestions, etc. These experiments may be conducted both as class exercises and home assignments; preferably, both combined.

The American Psychological Association has appointed a committee for the purpose of developing and publishing, on some cooperative plan, a series of class experiments which shall comply essentially with the following principles: (1) every individual student shall take an active and responsible part in the experiment; (2) the experiment shall be sufficiently intensive to make it vital; and (3) each step in the experiment shall be explained and interpreted in print.

The technical laboratory course is usually offered only to those who intend to do some advanced work in psychology. It is rather a course in training for research. Advanced lectures and seminar courses are given for intensive treatment of some sections of the subject from some limited point of view. Among the commonest courses are comparative psychology, child psychology, folk psychology, social psychology, psychology of religion, psychology of conduct, and history of psychology.

In the advanced work in psychology, as a rule, very little class work is given to students, who devote their time largely to a research problem. While the doctor's thesis frequently contains a real contribution to knowledge, that work is generally regarded as training for research.

What has been said of the first two groups of courses applies to colleges as well as to the liberal arts course in the university.

In the Secondary Schools Although psychology as a science is not naturally a high school subject, it is taught in many high schools and academies. At present the situation is very unsatisfactory because the curriculum is too crowded, there are no suitable

textbooks for this grade, as a rule the teachers are not adequately prepared, and a wrong notion as to the magnitude and nature of the subject prevails. There are signs of a wholesome tendency in the direction of making it a very broad and practical course which may best be called *mental training*, giving only an outline sketch of mental life as a basis for psychological, ethical, aesthetic, and other help, needed by the young adolescent. Such a course is very desirable, particularly for the large mass of students who do not go beyond the high school. In this way much very wholesome information is given without attempting to teach psychology as a science.

C. E. H.

In *American Normal Schools*. Reports gathered by the Committee of the American Psychological Association from 100 institutions show that in the typical (or average) institution the teacher of psychology has received college training, has had several years' experience in his work, and gives instruction in education or other courses as well as in psychology.

The course in psychology, which combines general and educational psychology, is required and prerequisite for subsequent or concurrent work in education. The class, which will average 107 pupils, meets as one section for forty-five-minute periods, and devotes in all ninety (actual) hours to the work. The content of the course varies widely. It is determined primarily by the textbook in use. In most schools too much time is spent upon the nervous system and sensation, not enough upon habit, the inheritance of capacities, mental deficiency and mental hygiene, retardation and acceleration in mental development, the learning process, and allied topics. The method of presenting psychology is the familiar combination of textbook, recitation, and class discussion, supplemented by outside reading. There are few formal lectures, few demonstrations and few or no experiments performed by the student. Nor is there in the typical institution any psychological or educational laboratory. There may be a few models, charts, or lantern slides of the nervous system, or a few "show-pieces" of apparatus to be demonstrated by the teacher.

This general picture of psychology in the American normal school draws not, of course, represent fairly its status in some of the best institutions. But, save in these few schools, the teaching has not kept pace with the modern development of the science, particularly in the fields of experimentation and application. It remains, rather, the traditional psychology of a generation ago, or it has become a simplified reproduction of college psychology, taught with too little regard to the development of insight into the mental processes of children of school age. While psychology, from logic and tradition, has been

held essential to normal school training, few institutions have sought to measure its actual contribution to the preparation of the teacher. The normal school teachers have persisted in the use of textbooks of psychology that they themselves compiled, and have failed to utilize the opportunity for observation and experimentation afforded by the practice and model schools at their command. Undoubtedly, the preparation and conduct of a course in psychology suited to the needs of the normal school is difficult, both because of the immaturity and meager stock of information of the student, and because of the pressure put upon the institution to do many things in a short time. These difficulties are recognized and normal school instructors are trying to meet them. It would seem that the institutions of higher grade "normal colleges" should lead in the reorganization of the teaching of psychology, and should, furthermore, contribute something to research in applied educational psychology, a phase of work which is practically nonexistent in the ordinary normal school.

PSYCHOLOGY, EDUCATIONAL - Educational psychology in its widest sense is a study of the laws of mental life applicable to educative processes. It would thus include pertinent facts and principles with their applications derived from general, genetic, social, and individual psychology. From this point of view educational psychology represents merely a selection and organization of psychological data that may be of practical service to the teacher. The range and indefiniteness of the field and the wealth of material from which selection may be made have given rise to great diversity in the character, scope, and content of what is called educational psychology and make impossible even an empirical definition based on what is included under it by teachers of the subject.

An inquiry instituted among the colleges and universities in which educational psychology is taught showed that in most institutions it is given as an undergraduate course with general psychology as a prerequisite, in some it may be taken as a first course in education without general psychology, in others general psychology is followed by genetic psychology or mental development, educational psychology being offered as an advanced course. Under such conditions the character and subject matter of the science will of course vary widely. Six types of courses can be distinguished and are indicative of the varying conceptions of the problem and content of the subject: (1) Principles of teaching based on psychology, in which general psychological conceptions are applied to educational practice. Concrete and practical problems arising in school work are interpreted in the light of psychological principles. (2) Psychology of the various school subjects, -- an analysis of the mental processes involved in reading, writing, spelling, arithmetic, etc., with the practical applications to teaching. (3) Selected topics from genetic psychology and child study, with a view to tracing in broad outline natural mental development from childhood to manhood. (4) Selected topics from general psychology which are treated in greater detail than in a general course, with specific application to school practice. This course differs from the first type by the greater emphasis on psychological facts and principles than on their application to the art of instruction. (5) Individual or differential psychology, in which

are studied the nature, distribution, correlations, and causes of individual differences and their significance for education. (6) Psychology of learning, an analysis of the various modes of learning and the factors conditioning the learning process.

This examination raises the question as to whether educational psychology has a distinctive field and a specific problem not covered by other recognized branches of psychology. If education is defined in its simplest terms as the process of bringing an individual from where he is to where he ought to be, its three main problems emerge: (1) Where he ought to be - the ends or aims of education - is the problem of principles of education to be worked out for the various types of schools and curricula and for the various periods into which mental life falls. (2) Where he is - the nature of the individual at every stage of his growth - is the problem of biology, sociology, and psychology, general, genetic, individual, and social. (3) How he is to be brought from where he is to where he ought to be gives the problems of methods of learning, on the one hand, and means and methods of teaching, on the other. Educational psychology seems to be legitimately concerned not with the second problem, but with the third. It is the dynamic psychology of the educative process. Its essential field, hence, is methods of learning, especially during school years and under school conditions.

Educational psychology is, from this point of view, not identical with principles of teaching. Its problem is how to learn, not how to teach, nor does its problem arise in general or genetic psychology. Psychology is a study of mental processes and their development, educational psychology is a study of the laws and conditions of mental work. Psychology studies the natural activity and development of mind; educational psychology the activity and development of mind when it is definitely directed to the attainment of certain prescribed ends. Systematic, constrained mental performance differs essentially from spontaneous, undirected activity both in its methods and in its results. If the essential characteristics of the educative process are guidance and direction to certain ends, then accuracy in results and economy in securing them are the tests by which the process is to be measured. This involves a systematic study of the processes involved and the most economical and effective methods of acquiring and organizing experience, and in particular the acquisition of the tools of knowledge and the essential experience of the race embodied in the school curriculum. Educational psychology thus has a specific problem distinct from and intermediary between psychology, on the one hand, and the art of teaching, on the other. Methods of learning have been left largely to the instincts of children, and they

build up the methods they ultimately come to rely on by trial and error. The adult comes to "know, by experience itself, that it is a marvelous pain, to find out but a short way, by long wandering." The discovery of this "short way" for the purpose of guidance and direction of pupils is the problem of educational psychology.

The sources of a science of this character must be: (1) a general psychological analysis of learning processes from which general principles of learning and consequently of teaching may be derived, (2) an organization of the observations and experiences of educators as to laws of economy in mental work, (3) an application of the results of experimental psychology bearing on educational processes, (4) an experimental study on learning processes in school children under school conditions. Actual school experiments will ultimately be the basis on which educational psychology will rest, if it is to become a science on its own account. Its problems can never be solved by merely taking the results of experimental or other psychology and applying them.

The subject matter of educational psychology, with this dominant point of view, may be indicated either with reference to the different methods and processes of learning with illustrations from and applications to school work or as a psychological analysis of the processes involved in the acquisition of school subjects, or both. An outline of the fields in which psychology has made the most significant contributions to the theory and practice of education and in which the applications to the educational process seem most direct and helpful, is all that can be done in the present stage of development of the science. The basis of learning and the foundation upon which education rests is the native equipment in instincts and impulses. The recognition of this fact and its significance is the notable characteristic of education and psychology during the past two decades. The studies of instincts in animals and children during this time have furnished a wealth of material that is suggestive to the educator. Educational psychology is concerned primarily with the modifiability of instincts and their transformation into habits. The laws governing the acquisition of new stimuli to the various instincts, the elimination of receptiveness to old stimuli, the acquisition of new responses, the suppression of old responses, and the blending of several instincts and their organization with reference to particular objects, still remain to be worked out specifically in usable form. The methods of utilizing or suppressing native tendencies in their application to school situations on a basis of scientific observations or experimental investigations constitute important problems in educational psychology.

The selection from the instinctive and impulsive forms of adjustment and the required

adjustments to which they give rise is made (1) by trial and error, (2) by imitation and play, and (3) by the formation of free ideas. The interrelations, applications, and relative values of these methods in acquiring and interpreting experience is the central problem of educational psychology. Definite and specific principles applicable to school practice are still in the making.

The learning activities with which the teacher is mainly concerned may be studied specifically as mental work involved in forming (1) associations between stimuli and mental states - technique and economy in observation; (2) associations between mental states and mental states - technique and economy in memory and association; (3) associations between mental states and acts - technique and economy in acquisition of skill. Notable contributions have been made in these three fields in recent years and have laid a foundation for a psychology of the educative process and an art of study.

The technique and economy in the acquisition of experience directly through perception and observation, the latter defined as systematic, purposive perception with a view to retention, have been systematically studied. The experiments on description, *Merkfähigkeit* and *Assoziat*, have shown the great inaccuracies in perception and observation, both in children and in adults, and have led to a re-examination of the processes involved, particularly as applied to objective instruction. The causes of inaccuracy - analyzed into the transformation of mental images, the specialization of memories, the lack of system and purpose in observation, inefficiency or defect in sense organs, narrowness of the span of attention or of the memory span, suggestibility, lack of motor activity with reference to what is observed, fluidity and fluctuations of attention, lack of supplementary ideas for interpretation, practice, and training, set specific problems for educational psychology.

The relations of attention and imagery to the learning process are problems that have been studied in their direct bearings on educational processes. Observations by teachers and investigations in the laboratory have thrown light on the conditions in the nature of objects and of the individual that determine attention. The fundamental importance of attention in all processes of mental work makes it a topic of major importance in an educational psychology. Likewise, the significance of imagery and of differences in image types in their bearings on methods of learning and on modes of presentation is of special importance to the teacher.

The experimental study of technique and economy in memory and association in recent years has furnished a body of principles of learning significant for educational theory and practice. While much of the work so far done has been concerned with rote learning, the math-

ods used can be and will be fruitfully applied to logical learning. The definite conclusions on learning by wholes and parts, on distribution of repetitions, on retentive, generative, and effectual inhibition, on relative values of various modes of presentation, on recall in learning, etc., are replacing vague opinions of learning processes based on untested experience and are indications of results that may be expected from further studies of the factors involved in the formation of associations and in retention and reproduction.

The study of the technique and economy in the acquisition of motor control and skill have similarly furnished principles of efficiency in the combination and coordination of motor responses and their development in accuracy, rate, and simplicity. The analysis of the processes and factors involved in learning to legography, typewriting, shorthand, etc., have given laws of habit formation which require to be tested in their relations to the manual activities of the school.

The effects of practice and the transference of practice, mental fatigue, and individual differences are important general factors that affect the educative process. The transference of training and the conditions under which it may occur in school work, the hygiene of mental work in the schoolroom and with school subjects, and the significance of individual differences in capacity to learn and in rate of learning, and the efficacy of equal practice on such differences, are the specific problems of educational psychology with reference to these factors. Satisfactory school experiments on transference of training are still lacking. Reliable methods of determining mental fatigue and valid principles of mental hygiene as applied to school activities are yet to be secured. The application of the known facts on the nature, distribution, range, correlations, and causes of individual differences to school problems has not been satisfactorily made.

Educational psychology of school subjects has centered about three problems: (1) a psychological analysis of the processes involved in learning reading, spelling, writing, arithmetic, etc., (2) the discovery on a basis of comparative tests of the relative values of methods of acquisition and presentation, (3) tests of efficiency or results. The experimental analysis of the factors involved in reading by study of eye movements, tachistoscopic studies of the reading field and reading processes, aphasia, fatigue, and hygiene in reading are illustrations of work done on the first problem. Similar studies have been made of processes in spelling, arithmetic, and writing, and in the acquisition of foreign languages. The investigations of the relative values of different methods of teaching spelling or writing are illustrations of the second problem. The devising of scales for the measurement of educational products in handwriting, arithmetic,

and English writing are illustrations of the third problem.

Important contributions for education are being made in all of the fields of psychology, and ultimately there will emerge a genuine psychology of education. A demonstration of educational from the other branches of psychology that would be universally assented to cannot now be made.

PSYCHOPHYSICS. The term "psychophysics" was coined by Fechner to denote "an exact science of the functional relations, or relations of dependence, between body and mind, more generally, between the bodily and mental, the physical and psychical, world." Natural science, Fechner says, can point to its laws, its methods, its facts, and mental science — psychology and logic — rests, at any rate in good part, upon solid foundations, but the relation of body and mind, of material and mental, has been little more than a topic of philosophical controversy. Yet it should be possible, by a method of concomitant variations, to trace and to quantify the connection of the "physical" of physics and chemistry and the "psychical" of empirical psychology.

Fechner starts out from the simplest and most accessible of "mental states," from sensation. The physical events with which sensation is directly connected are, evidently, "activities in our brain"; and the ultimate aim of psychophysics is accurately to set forth the relations of mind and nervous system. Fechner defines "psychophysical" activities as "physical [i.e. nervous] activities which

from the vehicle or substrate of the psychical, and accordingly stand in direct functional relation to them." It is, however, impossible to begin outright with this "inner" psychophysics; the brain is not "open to immediate experience", and we must, therefore, have recourse, in the first instance, to "outer" psychophysics. We must establish the numerical relations of *stimulus* and sensation, in the hope that, as knowledge advances, we may utilize the more superficial results for our more profound purposes. And we must not, of course, be content to stop short with sensation; we must aim at a psychophysics of perception, of feeling, of action, of attention, and so on. The work, Fechner tells us, will not be intrinsically difficult; patience, perseverance, and strict adherence to observed facts, will carry us through, and the outcome of our researches will be valuable, not only for science, but also for a sound philosophy.

Fechner was, to the end, mildly optimistic. When Wundt established the first psychological laboratory, in 1879, Fechner's note of congratulation warned him that, by thus attempting things on the grand scale, he was hurrying psychophysics to a conclusion, and in a few years would have nothing left to investigate. The prophecy turned out to be unimpaired; and Fechner's own work, despite his vast range of erudition and his increasing industry, was mainly confined to the intensity of sensation. In this field he accomplished four things.

First and foremost, we owe to Fechner the comprehensive development and theoretical interpretation of the "measurement methods," as they are called *par excellence*, the metric methods of psychophysics. These methods are modes of accurate procedure for the obtaining of test-values on numerical constants, i.e., to return to a phrase already used, for the quantifying of the psychophysical relation. Fechner's exposition is the basis not only of the later theoretical studies and of our current laboratory methods but also of the simpler procedures of applied psychology (mental tests, etc.). Secondly, we owe to Fechner the concept of the "just noticeable difference," or, as it is now termed, the differential limen, an invaluable instrument of psychological analysis. Thirdly, he undertook a number of investigations, which are important both for their results and also intrinsically, as planned with overt psychophysical purpose and as illustrating the use of psychophysical methods. Fourthly, Fechner gives us the sole correct idea of mental measurement, the idea of laying off a magnitude, e.g., of sensation in units of its own kind, and of standardizing these units by aid of their correlated stimuli.

Unfortunately, he fell at the same time into certain errors, which have not only dimmed the brilliancy of his actual achievement, but have also hindered the advance of the science which

he founded. In the first place, Fechner was mistaken in his view of the object of direct mental measurement. Instead of regarding the intensive sense-continuum as a finite stretch or distance, and the separate intensive sensations as points or positions upon it, instead, that is, of seeking to measure sensible intensity in terms of unit-difference or unit-distance upon the intensive scale, he considered the single sensation as a measurable magnitude, a mental quantity, and sought to measure the stronger by making it a multiple of the weaker. A high luster, a loud noise, a strong pressure were for him, as sensed, reducible to so many dull lustres, faint noises, weak pressures. Yet it is clear that the more intensive sensations are, to introspection, as single and simple as the less intensive; a loud tone does not, in any psychological sense, "contain," is not "made up of," a number of weak tones, the loud tone is merely the "kind of tone" that lies high up, and the weak tone the "kind of tone" that lies low down, upon the tonal scale or continuum, and all that measurement can do is to quantify the scale-distance which lies between them. Fechner had himself more than an inkling of the truth, but he allowed the parallelism of stimulus and sensation to mislead him.

In the second place, Fechner assumed that the just noticeable difference of sensation is a psychological magnitude, and that all just noticeable differences, from whatever part of the intensive scale they may be taken, are sensibly equal. He assumed, that is, that the perceptive observer can "carry in his hand" the idea of a just noticeable difference, and that this identical difference may be used as the unit of direct mental measurement. Now in fact the observer can no more hold to an unchanging just noticeable difference than he can, e.g., hold to an exactly reproducible millimeter; his idea will vary with circumstances.

In the third place, Fechner supposed that Weber's Law (y/x) was in the strict sense a psychophysical law, a statement of uniform functional relation between mind and body. This mistake led him to exaggerate the importance of the law, its range of validity, and the accuracy with which it can be formulated, it led, also, to a great deal of not very profitable controversy. Fechner made, however, no error of principle; he was always careful to distinguish between Weber's Law as an illustration of his theory of mental measurement and that theory itself. To identify Fechnerian psychophysics with the study of Weber's Law is to fall into a worse mistake than Fechner was ever guilty of.

It has been necessary to speak thus at length of Fechner's work, because the virtues and the faults of that work have alike exerted a decisive influence upon the development of psychophysics. Fechner made mental measurement possible, and he measured wrongly; he gave us the differential limen, and he misunderstood

it; he worked out Weber's Law, and he misinterpreted his results. The positive, in this summary, far outweighs the negative, but the negative has been a real stumblingblock in the path of progress.

What, then, is the present status of "outer" psychophysics? We have, within the Fechnerian lines, a clear understanding of mental measurement, direct and indirect; the metric methods have been rounded off into something like definitive form; and a goodly number of measurements have been made, not only in Fechner's field of sensation, but in many other departments of psychological inquiry. The great majority of these measurements are indirect, so that their full statement is psychophysical; but the fact that, with shift of emphasis, they may be regarded as psychological, shows that the rigorous Fechnerian distinction between the two disciplines is breaking down, — a fact abundantly attested by other evidence. Passing beyond the limits of Fechner's activity, we note that the psychophysical methods are in course of establishment upon a noncommittal mathematical basis, that the same methods have been modified for use in applied psychology and in the study of animal behavior, and that new fields of research — memory, correlation, etc. — have demanded and obtained methods of their own. It is hardly too much to say that practically the whole contents of modern experimental psychology might be claimed, by an extreme Fechnerian, as the extension of an "outer" psychophysics; and it is noteworthy that practically this position is taken in the dedication of Ebbinghaus' *Grundzüge der Psychologie*.

The progress of "inner" psychophysics, of physiological psychology, is less easy to gauge. Our knowledge of the sensory and motor mechanisms of the body and of the various divisions of the nervous system has, no doubt, vastly increased since Fechner's time. It may be doubted, however, whether the increase of physiological knowledge has led to a proportionate advance in psychological theory, to anything more, in fact, than partial and tentative reconstruction. Thus, the more we learn of the organs of sense, the less satisfactory do the traditional "theories" of sensation appear; and the more we learn of the motor mechanisms, the less satisfactory do the older "motor theories" of sense-perception become. This clearing of the ground is, in itself, an advantage, and more has been done than merely to clear the ground; we have von Kries' duplex theory of vision, von Frey's theory of pressure excitation, Stumpf's theory of consonance, — we have revised theories of optical illusion, of space-perception at large, — we have new light on the psychology of reading and of motor skill. At the same time, we have no generally acceptable theories of these things; school is divided from school; if we are on the eve of generalizations, still the generalizations

have not yet emerged. And as for physiological psychology proper, the connection of mental states and processes with the functional activity of cerebral and especially of cortical structures, our situation is even worse. The doctrine of localization has a fourfold rant in experiment, in pathology, in histology, in embryology; yet it remains to a large extent undetermined. Much has been expected from the neurone-theory; and it is not difficult, with neurone-chains at different levels, with cell-bodies as nutritive and nerve-fibers as conductive in function, and with the synapses or cell-boundaries as the loci of psychophysical process, to devise schemata of the neural correlates of feeling, attention, association, even of thought. But then these schemata are, after all, inventions; they are expressions of personal opinion rather than syntheses of observed facts, and it is significant that the two most recent theories of attention both account for the activity of the focal organ, in terms of the hierarchy of neurones, but within these limits in precisely opposite ways. What happens in the brain, topically, electrically, physico-chemically — when that organ is the seat of reproductive tendencies, of determining tendencies, of pre-occupation, when consciousness is recollective, attentive, imaginative, thoughtful, we simply do not know; we can make certain general statements, and we can avoid certain disproved errors, but our intimate knowledge is *in* the dark. Here, as before, to be sure, there is no need of pessimism; the great body of detailed studies now, at any instant, flange up into generalization, but, as things are, it cannot be said that Fechner's hopes for "inner" psychophysics have been fulfilled. PSYCHOPATHOLOGY A general term, including the study of all abnormal mental conditions (see **ABNORMAL**; **DIAGNOSIS**; **MENTAL**; **INSANITY**). It is principally used in contradistinction to psychiatry (*q.v.*) to indicate an emphasis on the mental or psychological aspect of the disorder, and not the clinical. S. I. F.

PSYCHOSIS A term which, within recent years, has been used to designate abnormal mental states, more especially those

PSYCHOTHERAPY

which are functional, i.e. not dependent upon discoverable alterations of the nervous tissues.

S I F

PSYCHOTHERAPY - The treatment of disease (physical or mental) by the use of various methods which act principally upon the mind of the patient. The diseases which are most successfully treated are those of mental origin, e.g. psychasthenia (*q.v.*) and hysteria (*q.v.*). The methods of psychotherapy are numerous. The one most used have been suggestion and persuasion (see HYPNOTISM), but the cathartic suggestion and the mental reconstruction methods are of wide application. These latter methods are of particular value in the treatment of states of anxiety, of phobias (*q.v.*), of obsessions (*q.v.*), and of other psychasthenic conditions. It has been shown that many of the purely mental disorders have their origin in childhood, and the methods of psychoanalysis and of psychotherapy usually lead to an investigation of the early mental life. See PSYCHOANALYSIS.

PTOLEMY (PTOLEMÆUS), CLAUDIUS (fl. 150 A.D.) - Astronomer, mathematician, and geographer, a native of Egypt, who probably resided at Alexandria. As an astronomer he dominated the medieval world until the days of Copernicus, and in geography he became the recognized authority of the Christian Renaissance. The Ptolemaic System of astronomy, based largely on the work of Hipparchus, is contained in the *Μεγάλη ἀνάγκη τῆς διοργανώσεως*, better known by its Arabic name *Almagest*. This work consists of thirteen books, the last five of which contain the essence of the planetary system. The earth is, according to this system, the lowest of the spheres in the center of the universe, and is motionless. Above this are certain zones or heavens, spherical in shape, in each of which a heavenly body revolves around the earth; these are Mercury, Venus, the Sun, Mars, Jupiter, Saturn. This theory of the planets was accepted until it was superseded by the Copernican theory. (See COPERNICUS.) Another original contribution made by Ptolemy deals with the *creation* of the moon. Ptolemy's geographical treatise was the *Γεωγραφικὴ Ὑφήγησις*, which was long used as a textbook and is interesting historically. Other astronomical and astrological works and a treatise on *Optics* are at-

PUBLIC SCHOOL SOCIETIES -- A type of educational organization common in the early part of the nineteenth century in the larger cities of the United States. The aim of these societies was to furnish free education to youth of the poorer classes on education at a moderate expense to those somewhat better to do. In this capacity, they formed an important factor in building up the free public school system. In their control, they were sometimes denominational or inter-denominational, sometimes non-religious altogether. In this and other respects they resembled the British and Foreign School Society, except that they were always local. The most important of these societies was in New York City, and is described in the article on the schools system of that city.

PUBLIC SCHOOLS COMMISSION - See PARLIAMENTARY EDUCATION COMMISSIONS; ENGLAND, EDUCATION IN.

PUBLIC SCHOOLS, ENGLISH -- The term Public School became attached during the early decades of the nineteenth century to

a group of institutions for higher education selected out of a larger body of endowed schools usually called Grammar Schools (*q.v.*). The majority of these grammar schools looked for their supply of pupils from the immediate neighborhood, and if the "Master" received pupils to reside with him, these would usually come from the homes of country residents within a few miles. But from early times, long before the Reformation, the wealthier, aristocratic classes had been accustomed to send their sons, especially the younger sons, designed for the church or the law, to be trained away from home. Winchester, Shrewsbury, and (later) Rugby in the provinces, and Eton, Harrow, Westminster, Charterhouse, St. Paul's and Merchant Taylors' in or near the metropolis were in greatest repute. Hence the use of the term *Public*, as distinguished on the one hand from merely local (Grammar) schools, and on the other hand from private institutions for which in the seventeenth and eighteenth centuries the term "*academy*" had come into use. This last term has now fallen into disuse (except in the case of the famous school at Edinburgh) and schools under private ownership are described simply as "*school*" or "*college*" at the discretion of the owner.

The use of the term *Public School* was emphasized by various inquiries instituted by Government Commissions into educational endowment between 1818 (Brougham's Commission) and 1861 (Taunton Commission). The *Public School* was clearly recognized as an institution of higher rank than the local Grammar School; indeed, a separate inquiry (Clarendon Commission, 1861) was undertaken to report on the nine schools mentioned above, which were described as *Great Public Schools*, and the sequel to this inquiry was the *Public Schools Act* of 1868, regulating the control of seven of these, Merchant Taylors' and St. Paul's being omitted because they had latterly become mainly day schools, being amply filled with London boys residing at home.

These seven schools, however, by no means included all boarding schools to which common repute attached the name "*Public*." The rapid increase of wealth which accompanied the industrial revolution created an immense number of families (especially in the north of England) able to pay high fees for their sons' education and desirous to place them in institutions where a social environment and culture could be procured similar to that enjoyed by those who frequented the "*Great*" *Public Schools*, and the unique influence of Thomas Arnold (*q.v.*) counted for much in impressing upon the laicured class the value of a corporate society highly organized by cultivated schoolmasters. If during the first half of the nineteenth century England had already enjoyed a system of municipal secondary education such as Germany had set on foot, it is probable

that the movement in favor of boarding-school education would not have maintained itself so decisively in public favor. But in the absence of any such system, it is not surprising that the tradition which had made these seven old foundations great and famous should be imitated by new foundations. Incidental circumstances aided such enterprises, facility of travel by railway was a great factor. Then England, in comparison with the Continent, had been for two centuries a fairly safe country for boys to travel about in, war had been unknown since the Reformation, the English race is nogatory by disposition, and families have always been ready to let younger sons leave home at an early age. Thus a variety of causes contributed to multiplicity of boarding-school establishments between 1840 and 1870. The most successful of these became known throughout England and took rank with the famous seven *Public Schools*, many others aspired to such a position but had to be satisfied with a humbler fame. They can be grouped into three classes according to their purpose or origin. First, some local grammar schools successfully followed the example of Rugby, -- Uppingham, Sherborne, Sedburgh, Repton, are perhaps the highest in repute. Secondly, entirely new foundations were created, sometimes by the energy of a schoolmaster, sometimes by a few laymen who desired to have a fine school established in their district. In this group, Marlborough, Chifton, Bradfield, Russell, may be mentioned. Thirdly, a school would be started with a specific bias, *i.e.* to prepare for some profession, thus Osborne and Dartmouth prepared only for the navy, Wellington largely for the army, while Huxleybury at first had a close connection with India. Or, still more important, the foundation would coincide the advantages of "*public school*" training with religious oversight more specific than the connection with the Established Church of England which, as a matter of historical social conformity, is inevitably found in the ordinary *Public School*. Thus Lancing is High Church, Stonyhurst is Roman Catholic, The Leys (Cambridge) is Methodist, and Mill Hill is a Congregational foundation. It should be repeated that for every school in each of these classes which has succeeded in establishing its claim to be ranked as a *Public School* there are dozens which have had aspirations in the same direction, but have to be content with receiving pupils who pay lower fees, and hence cannot command the same resources as their more distinguished rivals. Such schools often find little with success the best qualities of corporate life which are the distinctive boast of *Public School* tradition, but in attempting a classification they can be best grouped as secondary boarding schools. We are now familiar in England with the term *secondary* as including all types of schooling between elementary and

the one hand and college or university on the other, but this phraseology was not familiar to English teachers until all these classes of Public Schools had been well established in national esteem. Matthew Arnold (*q.v.*) was the first educationist to press on English attention (after the example of France and Germany) the importance of secondary schooling as something more comprehensive than anything implied by Grammar or Public School education, but it was only after the labors of the Bryce Commission on Secondary Education (1895) that the popular imagination in England was really attracted to the importance of an extended period of schooling, important for the democracy as well as for the governing and directing classes, in whose interest the Public School and its imitators are designed. Thus, if one desires to view the entire scheme of English school provision, one must place at opposite pole two institutions, to each of which the term "Public" is to be applied. The public elementary schools are local, state controlled and state supported, open to all without fee (with slight exceptions), ranging from infancy to fourteen years of age, limited to the subject of elementary instruction and taught by teachers certificated by the Board of Education. The Public Schools are non-local and boarding (although a few, such as Clifton, welcome day pupils also); they are neither state controlled nor state supported; they are open to all but only on payment of heavy (sometimes extravagant) fees; they receive pupils from the ages of fourteen to thirteen to fourteen, and they impart a secondary curriculum, directed in the later years for vocational training of various types; their teachers are recruited almost wholly from the two ancient universities and a proportion of the *ex* (steadily decreasing) are in Holy Orders, *i.e.* are ordained clergymen of the Established Church of England. It will be readily understood how pointedly the contrast between the public elementary school and the Public School is felt in English national life; the schoolboy and his teachers in each of these institutions bear the distinctive hallmarks of their class and carry with them through life the sympathies and prejudices of their early environment.

The unique quality of the Public School is to be found not in its curriculum, but in the organization of its community life. As regards the curriculum, progress has followed much the same course as may be witnessed in other European countries and in America; the old institutions are conservative, but even they give due place to modern studies and spend their resources freely in equipping laboratories, museums, etc., as well as play fields. Latin and Greek of course hold pride of place, but not more so than in Germany. But whereas in Germany distinctive types of curricula are relegated to distinct schools, the English plan is to comprehend all reasonable

proposals for vocational training in one school, dividing up the scholars into so-called "sides" as, *e.g.* the Classical Side, the Modern Side, or the Engineering Side. The only distinction between the Public School and other secondary schools as regards teaching is that the former, by its more ample financial resources, can provide greater variety of avenues for vocational equipment, but schools which are poorer in wealth often counterbalance this disadvantage by greater professional skill. Since the reforms consequent on the Bryce Commission the ordinary grammar and municipal secondary schools have greatly improved the caliber of their teaching force and are gaining steadily in popular favor on this account at the expense of their wealthier rivals.

What then is the essential feature of corporate life which is the peculiar boast of the English Public School? It is in reality a social organization of the community specifically adapted to the needs of youth in the earlier years of adolescence. A public school boy is a member of two groups: while at lessons he belongs to his class, called a form (*q.v.*), and he usually remains with his classmates in that group for at most one year; teachers and scholars both are regrouped at very short intervals. But when released from lessons he belongs to a "house" — *i.e.* a building where he sleeps and has his meals, to which he belongs during all the years he attends the school, here he finds his special friends, as a youngster he is a "fag" (see *Faggery*), when he reaches the XI form he has authority as monitor or prefect. His house is his special pole, his housemaster is or should be a grown-up friend. The very exclusiveness of this society, where each house is a rival to the others, where every master is personally interested in his young charges, draws out the most intense social energies of the boys, supplying under control an outlet for activities which in the United States have given great concern at times when displayed in high school fraternities (*q.v.*). Naturally the house community have found in athletics (*q.v.*) a strong bond of union ever since the days when "Tom Brown" captained his School House on the 'close' of Rugby. But it would be unjust to describe the house system as merely an athletic organization; all kinds of social activity, in musical and debating clubs for example, fall readily into this social plan. The system was not invented *ad hoc*; it grew up from natural conditions; Arnold and others of his time saw its psychological worth as providing the schoolboy both with personal oversight and with means for individual expression such as the large crowd of the entire school assembly could not offer. The best evidence of the value of the system is proved not only by its adoption in all types of secondary boarding schools, but by the transference of the same idea to secondary day schools. During the last twenty years, many of these

schools have adopted the "house" principle, although the pupils reside at home. The entire community of teachers and pupils is divided into permanent groups of not more than fifty. When a pupil enters the school he is allotted not only to a form for lessons, but to membership in a House; if older brothers have preceded him, he will join the same house to which they belong; if not, he is assigned to a house community on some plan of geographical distribution or other local arrangement; the house, here as in the boarding school, provides him with a small circle of associates throughout his school life. This plan was first tried at Clifton, a Public School which has about one-third day pupils on its school roll. From Clifton it spread to many schools which have no house for boarders, but receive only day pupils.

We have noted above that the Public School usually limits the entrance age of its pupils to thirteen or fourteen, in one or two cases -- Clifton is again an example -- a junior department is maintained for little boys, but usually boys under thirteen are sent by their parents, often at the age of nine, to private schools which have grown up under the shadow of the Public Schools and are known by the distinctive title of Preparatory Schools; the most prosperous reach in numbers to 100, others receive only twenty or thirty little boys. The owners of these schools have almost always been teachers in a Public School, and give close individual attention to the youngsters, being careful to ground them diligently in the rudiments, so that they may successfully pass the written examination which each Public School conducts before a pupil is admitted. These examinations are often a pretty severe test of knowledge, for there is great competition to secure a place in a famous Public School, especially in times when trade is good and wealth abundant. The Public School endeavors to be select not only in the social and material status of its clientele, but by rejecting so far as possible scholars of low intellectual caliber, hence the important rôle played by the Preparatory Schools, of which some hundreds are in existence at present, they have formed a professional organization and publish a journal of good standing. The headmasters of the Public Schools have also organized a sort of association called the Headmasters' Conference, founded by Thring (*q.v.*), but each of them is too much of an autocrat in his own sphere to be prepared for any large measure of coöperative activity, and they usually hold aloof from any form of state inspection or control. Indeed, there is probably no position in English civic life where a single individual exercises such uncontrolled power over others as does the head of a successful Public School; the governing bodies leave him a free hand, knowing that laymen can scarcely interfere with prudence in the details of an adolescent society; the assistants are, of course,

often consulted, and a wise headmaster relies on their judgment, but officially they have no status other than that of assistants to their chief; tradition, however, is a potent force in checking possible excesses of authority, and it is rare that discontent with the system finds public expression. This traditional habit is further fostered by the common training which all the masters, heads, and assistants have received. More than 90 per cent of these masters come from Oxford or Cambridge; a graduate of the newer universities can scarcely intrude into this select academic society. These two universities also maintain connection with the Public Schools by a joint board (*q.v.*) for conducting university entrance examinations and by an elaborate system of valuable scholarships offered by all the colleges at Oxford and Cambridge (*q.v.v.*) The reputation of a Public School is largely gauged by its successes in winning entrance scholarships, and the winners' names are published in the daily press.

It will be seen that the Public School is quite a distinctive English product. The pupils have not only increased, as we have seen, in proportion to the growth of the country in wealth and in social ambitions, but they have found their special métier in the extraordinary demand for men of ability and leadership which characterized the expansion of the British Empire through the nineteenth century. India and all the Crown colonies are practically governed by Public School alumni, and the government departments in London as well as the army are almost wholly staffed from the same source. The growth of the democracy has naturally tended to challenge this dominance, and at the present moment the claims of men bred in elementary or municipal schools are being hotly contested. It is certainly a misfortune that this system of schooling should have emphasized the cleavage that exists between municipal life in our great cities and the imperial interests which center at Whitehall. As a distinctively English growth, the system has hardly found a foothold in Ireland, and Irish parents who wish their sons to gain its advantages send them across the channel to an English school. In Scotland, however, a few schools after the English pattern, such as Fettes, Larbert, Merchiston and Glendalmond, have gained a high reputation. And, since the governing ideas of the system are specially adapted to boys, few efforts have been made to adapt the organization to the needs of the other sex; the important developments since 1880 for the higher education of girls and women have taken a different course.

PUBLIC SCHOOLS, SYSTEM OF FREE. - SEE FREE SCHOOLS, NATIONAL SYSTEMS OF EDUCATION

PUBLIC SERVICE, EDUCATION FOR - *England* - With few exceptions all appointments in the Civil Service are filled by competitive examination. This system was first introduced in connection with the Indian Civil Service. When the charter of the East India Company lapsed in 1851, a special commission under Lord Macaulay recommended the introduction of open competition to select civil servants for India. In 1855 a Civil Service Commission was appointed by an Order in Council. For the home service political nomination was not abolished, but qualifying examinations were conducted by the Civil Service Commissioners. The principle of open competition was not introduced for the home departments until 1870, and this still prevails. It is to be noted, then, that no attempt is made to give any special training for the different branches of the Service. The chief aim is to secure candidates of intellectual ability and good education rather than technical knowledge. The special training is received in the ordinary course of routine work after the candidates successful in the competitive examinations are appointed. The aim is to make the scheme of examinations "conform so far as possible to the course of established education in the several grades." The Civil Service Commissioners do not desire through the examinations to affect the educational system in any way. Consequently, with few exceptions, no information is issued as to "the course of preparation which candidates should follow or the books they should study." Candidates must be guided by the general requirements for the various branches of the service and the examination papers which are usually published. Much criticism has been levelled

PUBLIC SERVICE

late against the examination system, more particularly in connection with the second class service, but no fruitful suggestions have been made of an alternative which will safeguard the interests of the public and eliminate injustice in the method of selection. It is objected in the main that there is a tendency for candidates to repair to the examiner and to leave the secondary schools at too early an age. But this is probably an element incidental to any system of competition. The principle suggested in 1851 by Macaulay is still followed, that "the examinations should be based on such previous preparation that candidates who fail can without difficulty turn to some other occupation." To take an example from present practice the examination for the Home Civil Service (Clerkships I), the Indian Civil Service, and Eastern Cadetships, the age limits for which are twenty-one to twenty-three for the Indian and twenty-two to twenty-four for the Home and Colonial Services, attracts candidates who have been educated in public or grammar schools of good standing and have then pursued a course at one of the universities. As a general rule, all the candidates are graduates in one or other of the faculties. The majority come from Oxford and Cambridge, followed by those from Edinburgh and Dublin. The following figures will, however, indicate the number of successful candidates who were specially prepared for the examination between the years 1890 and 1900 (the last date for which such statistics were drawn up):

SPECIALLY PREPARED			
Not Exceeding 3 months	For more than 3 months	Time not stated	Not specially prepared
11	232	7	156

Both Oxford and Cambridge give special preparation to candidates for the higher division of the civil services, and this practice is followed in a few of the other universities. The majority, however, proceed to a well-known preparatory establishment in London. Since 1906 the tendency in the higher division examination has been to reduce the number of different subjects taken by each candidate so that the actual university course may now perhaps be sufficient preparation. The competition for places in the Home (Clerkship I) and Indian Civil Service and Eastern Cadetships is severe and there are usually three candidates for each vacancy. The following is a list of subjects from which candidates for Clerkships I, the Indian Civil Service, and Eastern Cadetships may select: English composition and the following languages and literatures: English, Latin, Greek, Sanskrit, Arabic, German, French, Italian; mathematics, lower and advanced; natural science (chemistry, physics, geology, botany, zoology, animal physiology); history (Greek, Roman, English, general modern); logic and psy-

chology; political science; Roman law, English law. The marking of papers is so arranged that a deduction is made in order to secure that a candidate be allowed no credit at all for taking a subject in which he is a mere amateur. Candidates for the Indian service must pass a second examination at the end of a year in subjects including Indian Penal Code and Code of Criminal Procedure, a vernacular language; Indian Evidence Act, Hindi or Mohammedan law, Sanskrit, Arabic, Persian, or Burmese.

The competitive examinations for entrance into the Royal Military Institutions indicated, in the years 1898-1900, that 1281 successful candidates came direct from school, while 785 candidates had had private tuition subsequently. But it must be mentioned that most of the large schools have special departments which give preparation for these examinations.

For Second Division Clerkships (age limits eighteen to twenty) which lead to appointments for work of a routine character and involving little administrative responsibility, the subjects of examination include: handwriting, orthography, copying MSS., arithmetic; English composition; prices, bookkeeping and shorthand; geography and physical history, Latin, German, elementary mathematics; inorganic chemistry and elementary physics. Candidates in the period 1898-1900 had had the following preparation: grammar schools 61.7 per cent; elementary schools 43.5 per cent; higher grade schools 9.2 per cent, and private schools 12.3 per cent. Of 195 candidates 101 had received special preparation.

The examinations for Second Division and other lower branches of the civil service have not reacted favorably on education in general. They have called forth an alarming array of civil service examiners, who attract pupils away from the ordinary secondary schools. Every large town has a number of such establishments which aim at nothing but securing a place for their candidates on the list of successes. Unfortunately there are no statistics bearing on this subject, but as an indication of the possibilities it may be mentioned that the Civil Service Commissioners in the year 1908 dealt with 37,450 cases, i.e. candidates for all departments of the civil service. The whole question of examinations and appointment in the civil service is at present being investigated by a specially appointed Civil Service Commission (1912).

I. L. K.

United States.—The civil service system in this country is only gradually recovering from the evil traditions of the "spoils system," introduced early in the nineteenth century. Some measure of reform was introduced in 1883 by the National Civil Law, which introduced competition and probationary service and established a Civil Service Commission. But only about 40 per cent of the civil service

appointments fall under the "classified" service to which alone the reforms apply, the "excepted" appointments still being subject in large measure to the old evils. There is practically no institutional preparation for the civil service, or even for the examination for entrance into the civil service. Such preparation awaits the development of a greater permanence and stability of tenure in the various branches of the governmental service as well as a greater differentiation in this service and more definite technical requirements for qualification. There are evidences, however, of a greater appreciation, on the part of the public, of such needs and a growing demand for a broader and more specific training for all branches of public service. An excellent beginning has been made in the preparation of suitable candidates for the foreign and consular service here described.

Educational Preparation for the Consular Service. In the principal European countries both the diplomatic and consular services have, for a long time past, afforded a definite career, with tenure guaranteed during good behavior, promotion for meritorious service, and usually retirement on a pension. Prior to 1900 neither the diplomatic service nor the consular service of the United States possessed the essential elements of a career; for there was no stability of tenure, and both admission and retention in the service, and to some extent promotion, were dependent upon the measure of political influence possessed.

In 1900, however, great changes were made in the American consular system by the Reorganization Act of April 5, 1900, and the Executive Order of June 27, 1900. Thanks to this legislation and supplementary regulations, the most glaring faults and abuses of the old system have been corrected, and a thorough system of examinations regulating admission into the service has been established, promotions have been based upon relative efficiency shown in actual service, and a reasonable degree of permanence of tenure has been assured.

The entire consular service was reclassified and admission has been restricted to 105 places among the 298 consulates-general and consulates, namely, 60 consulships of Class VIII with a salary of \$2500 and 45 consulships of Class IX at \$2000. Vacancies arising in any position above these two grades are filled exclusively by promotion based upon meritorious service performed in a lower grade.

The examinations, which are conducted by a board of three, consisting of two officers of the Department of State and the Chief Examiner of the Civil Service Commission, are partly oral and partly written, the two counting equally. The oral examination is useful in determining the candidate's alertness, general information, natural fitness, and address. The written examination includes a

modern language—either French, German, or Spanish; international, maritime, and commercial law; political and commercial geography; arithmetic; natural, industrial, and commercial resources and commerce of the United States; political economy; American history, government, and institutions; and modern history (since 1850) of Europe, South America, and the Far East. The successful candidate is required to obtain a general average of at least 80 per cent in the combined examinations. In order to take the examinations, however, candidates must first be designated for appointment subject to examination, and these designations, which take no account of the political affiliations of the candidate, are so made as to secure proportional representation of all the states and territories in the consular service. Similarly all appointments are made in conformity with the same rule.

The establishment by the United States Government of conditions which promise a career for young men in the consular service of the United States has encouraged several prominent universities and colleges in this country to inaugurate and maintain systematic courses of instruction for the training of candidates who are ambitious to enter this field of government service. Two or three enterprising institutions, foreseeing the developments of the last few years, had established, prior to 1900, facilities for fitting young men for the American consular service. Preeminent among these institutions, both as a pioneer and from the viewpoint of thoroughness, is the George Washington University at Washington, which for nearly a decade has offered special facilities for the preparation for government service, both at home and abroad. Since 1906, however, this institution, in its College of Political Sciences, has maintained courses of study which are more complete and responsive to the subjects required in the government examinations for admission to the consular service than are offered elsewhere. These courses include international trade; commercial policies; resources of the United States; political economy; political and commercial geography; international, maritime, and commercial law; American history, government, and institutions; modern history of Europe, South America and the Far East; modern languages; and highly specialized courses on the consular service itself, including the rights, duties, and methods of procedure of consular officers, origin and development of consular establishments, extraterritorial privileges, etc. The requirement for admission to the College of Political Sciences is the completion of two years, or its equivalent, of satisfactory undergraduate work in any college of good standing. The completion of the courses in the political sciences ordinarily requires two years, and for this work the degree of Bachelor of Arts is conferred. The higher

degrees conferred for post-graduate work are Master of Arts (A.M.), Master of Diplomacy (M.Dip.), and Doctor of Philosophy (Ph.D.).

Yale and Columbia universities offer a joint course in preparation for the foreign service, and those who complete it satisfactorily receive a certificate signed by the presidents of the respective universities. The underlying idea in this plan is the desire to avoid the needless duplication of expensive courses in the two universities. Each supplies what the other lacks. Yale is exceptionally strong in geographical and political courses, while Columbia has a wealth of foreign language courses. The joint course is designed to prepare students for practical work in foreign countries, either by entering the service of the United States Government, or in business enterprises, or in missionary or scientific lines. Students who register are expected to have completed successfully at least two years of undergraduate work at a college of good standing, and the preparation for the consular service calls for three years' work and for other foreign service in special fields two years' work. Students are admitted to candidacy for the regular academic degrees under the usual conditions of the two cooperating institutions.

The University of Wisconsin, in its School of Commerce, prepares young men for the consular service and for foreign commerce. It offers a group of studies designed especially for the consular service and pursued during the junior and senior years. These courses embrace modern languages, colonial politics, contemporary international politics, history of diplomacy, international and commercial law, federal administration, and the consular service.

The University of Chicago also advertises courses to prepare men for the consular and foreign commercial service, offering for this purpose courses in the subjects above described, although at this institution the work of training men for the consular service fits in with the general work of the university.

The University of Illinois (Urbana, Ill.) gives a four years' course in commerce and the consular service. The curriculum on the consular service is designed to meet the precise requirements of the consular examination, as already explained.

Harvard University has recently established a Graduate School of Business Administration, which gives all the courses necessary in the preparation for the examinations to enter the consular and insular services of the United States.

The University of Pennsylvania, in its department known as the Wharton School of Finance and Commerce, has for many years maintained courses suitable to fit men for foreign commerce. Very recently a serious effort has been made to adapt these courses to the special requirements of the consular ser-

PUBLIC SERVICE

vice, with the result that this institution must be included among the best facilities of the country.

The State University of Iowa (Iowa City, Iowa) contains a School of Political and Social Science and Commerce, which aims to train candidates for the diplomatic and consular service and for commercial careers.

The University of California (Berkeley, Cal.) contains a College of Commerce, wherein courses are given which appear to meet all the requirements of the consular examinations.

The University of Minnesota, while containing no separate school or department for training men for the foreign service, offers several courses suitable for preparing men for such service. The same is true of the University of Michigan, Cornell, Leland Stanford, and several other higher institutions of learning.

Recently a carefully devised system of examinations of candidates for appointment as secretaries of embassy or legation of the United States has been put into operation in the Department of State, under the direction of a Board composed of four officers of the Department and the Chief Examiner of the Civil Service Commission. These examinations follow quite closely the plan of the consular examinations. This system for entrance into the diplomatic service, supplemented by the present policy of promoting efficient secretaries of embassy or legation to be heads of mission, furnishes further justification for the establishment of collegiate facilities for systematic and thorough preparation for the foreign service of the United States Government. J. B. O.

See CITIZENSHIP, EDUCATION FOR.

Germany.—While the system in general does not differ in Germany from that of England or France, since it is dependent on competition, the regulations for preparatory training are more rigorous. Thus in Prussia candidates for the lower branches of the civil service must have passed the maturity examination (*Reifeprüfung*) after six years of work in a Gymnasium, Realgymnasium, Oberrealschule, or *höhere Bürgerschule*, or promotion into Obersekunda of one of the nine-year secondary schools. A state examination must be passed in addition. The special training is obtained during a probation period of varying duration. For the higher administrative, judicial, and technical positions candidates must in most cases have attended a university or technical institute for at least three years, must pass the academic examination in their respective fields, and then the special state examination.

France.—In no country perhaps are civil service appointments so much sought after as in France. As in England, most of the appointments are dependent upon competitive examinations, while for some, certain prerequisites are imposed, e.g. graduation from a secondary school (*bachelier des lettres*), a law

PUNCTUATION

degree (*baccalé en droit*), or a doctorate in science or medicine, etc. The training is given after appointment, a period, varying in different offices, being spent as supernumerary, auxiliary, auditor, etc. In only a few branches, mainly technical, military, and naval, does the government maintain special schools, e.g. *École Polytechnique*, *École Militaire de St Cyr*, *École d'Etat Major*, *École des Ponts et Chaussées*, *École des Mines*, *École Navale*, *École Normale*, *École Forestière*, etc.

PUGET SOUND, UNIVERSITY OF, TACOMA, WASH.—(Organized in the year 1903) under the auspices of the Methodist Episcopal Church. The school consists of a college of liberal arts, school of home economics, school of commerce, school of law, school of education, school of public speaking, and schools of music and art, together with an academy and junior academy. The institution has seven and one half acres of land in the heart of the city and seven buildings. The faculty consists of twenty professors and fifteen instructors. The school is coeducational, maintaining literary societies, but no Greek letter fraternities. A six-weeks' summer normal school is conducted. During the school year 1910-1911 the entire enrollment consisted of 408 students, of whom about one fourth were in the College of Liberal Arts, the remainder in the Academy and other schools of the institution. J. C. Z.

PUNCTUALITY.—See SCHOOL MANAGEMENT.

PUNCTUATION.—The general theory dealing with this subject will be found under COMPOSITION, and EXPLANATION USAGE. Here only an account of the technical side of the subject is given.

1. The conventional rules to be memorized are, (1) the period after abbreviations, (2) the colon (:) at the end of a sentence intro-

ducing a long quotation indented as a paragraph, (b) before such an enumeration of particulars as requires semicolons between the particulars, (c) at the beginning of a letter after a salutation consisting of two or more parts (but usage permits a comma here); (3) *commas* (a) to divide series of words without conjunctions, (b) before short quotations not indented; (4) points of *exclamation* or *interrogation* standing after a part or after the whole sentence according to whether the part or the whole is exclamatory or asked, and in either case superseding any other punctuation, (5) single marks of *quotation* to indicate a quotation within a quotation, (6) *parentheses*, rarely used except to insert instances in textbooks and reports.

II. The principles of punctuation should be taught in strict relation to sentence-structure. Most of the rules of punctuation, and all its difficulties, arise from considerations of sentence-form. In this primary function of indicating syntax, punctuation may be summarized for teaching as follows: (1) The *period* is used to distinguish sentences from clauses. No one can fail to understand this rule; but so many students fail to apply it that there is need of more careful elementary instruction in the distinction on which it is based. (2) The *colon*, except in the conventional uses noted above, is practically obsolete. In older prose it marked a unit midway between a sentence and a clause. In prose of to-day this unit is no longer generally recognized. (3) The *comma*, in general, is omitted or inserted according as a subordinate part is grammatically necessary or not. Omit the comma between parts which are intended to be taken together as one, insert the comma between parts which are not so intended. The principle applies obviously to all parenthetical expressions, i. e. to words, phrases, or clauses which are not necessary to complete the syntax of the sentence, and also to adverbial clauses of condition, cause, or exception (introduced by *if*, *because*, *unless*, *though*, etc.) whenever, as is usually the case, these are not intended restrictively. A parenthetical expression has a comma after it, before it, or on each side, merely according to whether it stands at the beginning of the sentence, at the end, or in the midst. (a) In particular, a relative clause is or is not set off by a comma according as it is intended to be nonrestrictive or restrictive, i. e. grammatically nonessential or grammatically essential, unnecessary or necessary to complete the meaning attached to its antecedent. Frequent violations of this rule in elementary composition show the importance of learning punctuation in relation to syntax. (4) The *semicolon* is generally confined to separating the parts of compound sentences. Its use being generally to indicate that the parts between which it stands are coordinate, it hardly occurs in complex sentences. But not all compound sentences have semicolons.

The semicolon is typically used to separate parts which have commas within them; or conversely, when the parts of a sentence have commas within them, these parts have a semicolon between them. The office of the semicolon is thus to distinguish the larger divisions of a sentence from the smaller divisions, the coordinate parts from the subordinate parts. Where there are no commas within the parts, a comma is now generally sufficient between them; but many good writers still prefer a semicolon between the parts of all compound sentences in which the grammatical subject of the second part is different from that of the first. The semicolon is also and more generally used in those balanced compound sentences which dispense with a conjunction, but, except in such careful balances as are unusual with young writers, sentences of this sort had better be avoided. Otherwise there is danger of merely running sentences together by using semicolons instead of periods. (5) The *dash* marks a place where the construction is broken, either interrupted or left incomplete. Therefore it should be used very rarely.

III. Details and exceptions should generally be postponed until the principles are established in a student's practice. Of the many manuals one of the most comprehensive and convenient for the teacher's reference is the *Style Book, a Compilation of Rules Governing Executive, Congressional, and Departmental Printing* (Washington, Government Printing Office, 1911), which includes also many useful tables of abbreviations, capitalization, addresses, signatures, spelling, and proof reading. See also DE VINNE, T. L., *Correct Composition* (New York, 1911), and *Manual of Style*, published by the University of Chicago Press.

PUNISHMENT, CORPORAL. — History.

-- *On the Continent.* -- Few educational principles have found such general acceptance throughout the world and in every age as the belief in the necessity of corporal punishment as an effective means of training up the young. Solomon's dictum that "he that spareth the rod hateth his son, but he that loves him chastises him betimes" has found many supporters. It was not until a better study of child life and child development were added to the views of a more humanitarian age that the severity of corporal punishment has been relaxed and its gradual elimination strongly advocated. Among the Greeks there is little mention of corporal punishment at Athens, but at Sparta it was employed not only as a means of correction but as a favorite method of hardening the young. The early Romans were especially severe in the training of children. In contrasting the old education with the new as introduced by the Greeks, Plautus refers to the punishments inflicted for unpunctuality and "for a mistake in a single syllable,

PUNISHMENT, CORPORAL

your skin would be made as spotted as your nurse's gown" (*Dacrydes*); the new education was too indulgent. Horace refers to his teacher, Orbilius, as the "thrasher" (*plagosus*). Mutual complaints of the disturbance caused by the noise of blows from a neighboring school. The instruments of correction used by the Romans have largely become standardized, and deserve some notice. The *scutica* was a strip of leather; the *ferula*, which has had the longest history and the greatest vogue, was a rod; the *flagellum* was of leather in the form of a knot or cat-of-nine-tails, the *virga* was a switch more nearly corresponding to the birch. The flogging was frequently administered on the bare back. "Hoisting" was employed for the better convenience of the teacher. The rod was used for striking the hand (*manum ferula subduzimus*, Juvenal). Succeeding schoolmasters were unable to do more than refine on these instruments for what may be called traditional corporal punishment. Other instruments of torture were, however, added. Quintilian (*q.v.*) strongly objected to the use of corporal punishment for its degrading tendency and because it was fit only for slaves, and advocated modes of training which are more rational and make an appeal which can be continued when pupils have grown up to manhood. Plutarch in his *Treatise on Education* recommends exhortation and appeal to reason rather than blows and stripes.

The medieval period placed a liberal sanction on corporal punishment. Flagellation as a means of penance was widely used in and outside of the monasteries. To this practice was added the doctrine of original sin which justified any means for expelling the devil out of children. Flogging became the regular accompaniment of the school. In medieval carvings and pictures the teacher is represented with a switch in his hand. There was little attempt at an adjustment of punishment to crime. And so to be at school and "to be under the rod" became synonymous. Few scholars could boast that they had been through school without being flogged. In some German Latin schools the punishment was inflicted by a special official known as the "blue man" from the fact that he used to wear a blue coat under which he concealed his instrument. Boys were whipped so long as they remained at school, and no discriminations were made as to age. The German schools introduced the whipping blocks and whipping posts to which offenders might be strapped to receive their correction.

With the Reformation no amelioration appeared. Luther insists on the necessity of the strap to prevent acts of insubordination, impudence, and bad training, for children were childish, weak, and inexperienced and must be molded. On the whole, however, he recommends moderation and refers to the old days when "children were treated so harshly that

PUNISHMENT, CORPORAL

they were called martyrs in school." But the Latin schools continued to retain their severity and afforded a vicious example to the rising elementary schools. The school and church ordinances, it is interesting to note, recommended moderation, but ineffectually.

A German School of the Sixteenth Century.

Thus the Saxon General Articles (1557), Wittenberg Church Ordinance (1559), Lippe Church Ordinances (1571), and the Magdeburg School Ordinance (1554) may be mentioned as examples. And yet the presentation of a rod to a new teacher formed a part of the ceremony of investiture. The type of men who now took to schoolkeeping was not calculated to contribute better methods of maintaining discipline. New forms of torture were added—standing on pens, kneeling on a sharp edge of wood, and the *Sputula* or *Jonathan*. The last was a bathtub with a hole in it, used to strike the hand, and was effective in raising blisters. The punishments were in the majority of cases administered in public. It is recorded (see Southey, R. and C. C., *Life of Rev. Andrew Bell*, Vol. II, p. 623) of a Saxon schoolmaster that during his fifty-one years' superintendence of a large school he had given 944,560 canings, 321 floggings, 209,000 custodes, 136,000 tips with the ruler, 102,000 boxes on the ear, and 22,700 tasks by heart. It was further calculated that he had made 700 boys stand on pens, 6000 kneel on a sharp edge of wood, 5000 wear the fool's cap, and 1700 hold the rod above their heads. In the Jesuit schools flogging was employed and a special Prefect of Discipline was intrusted with its administration. It remained for France to introduce in the eighteenth century a form of solemn ceremonial in connection with flogging which was especially employed in fashionable girls' schools. Offending pupils—of the triviality of the offense mattered little—were compelled to walk up to the teacher and with a bow ask for the punishment, the rod was brought in

PUNISHMENT, CORPORAL

by a servant, the offender was hauled without any regard for modesty, and the correction was inflicted, after which the offender had to kiss the rod and express her gratitude to the teacher. This practice was transported to England and appears in Scotland.

England. The history of physical or corporal punishment in England (and so far as pre-Reformation history is concerned the English conditions may be taken as applying to the continent of Europe in so far as it is coincident with the Western Empire) is extremely important as indicating the lines of development of moral education in Western Europe. We may take it as certain that English and Western education directly inherited corporal punishment, as it inherited so many other vital characteristics, from

The Whipping Stool of the Litchfield (Eng.) Grammar School

Roman Imperial education. Corporal punishment for boys indeed is one of the few cases in which we can trace back into what may be called Romano-British or educational tradition. In the *Indicium Culparum*, a quasi-criminal code belonging to Wales in the sixth century, the period (550-650) when the Welsh Church and the Welsh principalities appear to have emerged in organic form from their Roman-British origin, the following provision on the subject of corporal punishment for boys occurs: *Si quis parvulus usque ad annos XV quodlibet delictum commiserit, nihil sub puerice, nisi disciplinam accipiat; post hanc vero suam utatam, et quod furabitur resti-*

PUNISHMENT, CORPORAL

tuit. (See Haddon and Stubbs' *Concords and Ecclesiastical Documents relating to Great Britain and Ireland*, Vol. I, p. 130.) This canon was not restricted to the old British Church. It was at once adopted by the Roman or Papal Church, which came to England with Augustine, and among the excerpts of Egbert, Archbishop of Canterbury (750 A.D.), it takes a similar form. (See *Excerptiones Egberti Arch. Ebor.*, 750 A.D., 94. *Spelmanii Concilia*, Vol. I, p. 267. Ed. 1639.) Thus we find that at any rate from the sixth century corporal punishment was regarded in principle by the rulers of the Church as the proper discipline for boys under fifteen years of age, and we may be sure that the clerical schoolmasters of that date accepted the principle. The common English and French practice in the mid-twelfth century is to be seen in the case of Hugh of Lincoln, who attended a school at the Monastic House of Vellarbenoti near Grenoble at the age of eight years and was flogged continually. The following sentence is significant: *Sic demum infantile flagella pudagum atterant.* (See *Vita S. Hugonis Lincolnensis*, Rolls Series, p. 8.) A purely English instance occurs a little earlier than this: A master whose children are discovered as "diedynge theyr masytel for fere of correccion." The poor fellow was punished by Providence; but was cured by the prayers of his grateful pupils at the shrine of St. Ermenylde. (See Bradshaw's *Holy Life and History of St. Westburge: Chatham Society*, Vol. XV (185), p. 83.) But a more vivid instance of medieval methods than these is to be found in the discipline of the song school at Westminster Abbey in the thirteenth century. The value of these instances is that they show how frequent a part the rod played in the daily life of these little boarders. The rules for the behavior of these boys are happily extant and have recently been edited and printed by the Provost of King's College, Cambridge (Dr. M. R. James), in his volume on *Westminster Manuscripts*. The rules open with a quaint recital to the effect that "whereas it is proper in every way that boys who are *in statu pupillari* should be polite and graced by distinction of manner, it is right that certain things be set before them for their information." Punishment means the rod. When the dormitory rises each boy must say a certain number of prayers "in perfect quiet and order" or he is to be punished. They must make their beds, wash, and go quietly to church under dread of "severe punishment." The rules for good behavior in church are exact: "Let any one who transgresses the above feel a blow with the fagle without delay" or "immediately incur a blow with the fagle." It may be mentioned in passing that there is an illuminated Ms in the British Museum in which a monk is flogging a boy in church. The same rules applied with respect to the return walk to school. If any boy talked Eng-

PUNISHMENT, CORPORAL

may exercise the right. With this practice has grown up the practice of keeping a record of the punishments inflicted. At the same time there has appeared the tendency to replace the cane or rattan by the Scotch "taws" or leather strap. In the secondary schools corporal punishment is in most cases employed as a last resort and is inflicted by the head master. The cane is the most usual instrument for the purpose. In some schools the parents are informed that their son is to receive punishment, and the cause is given. The teachers of both elementary and secondary schools are subject to common law procedure for assault for any gross violation of due moderation in inflicting punishment, which results in impairment of health or disfigurement.

France. — As in Italy and Belgium corporal punishment is entirely forbidden in all types of schools in France. The rescript for elementary schools was passed in 1887 (Arrêté, Jan. 13, Annexé 20). Bad marks, reprimand, withdrawal of the period of recreation, detention after school, temporary exclusion up to three days, are the penalties which are recognized. Similar provisions were made for secondary schools in 1890 (Arrêté, Juille 5, 1890). The regulation forbidding corporal punishment must be displayed in the elementary schools.

United States. — The tendency to moderate or abandon corporal punishment has already been referred to. In 1900 the regulative principles in cities of 100,000 or over stood as follows, making the classifications somewhat broad. (1) Corporal punishment was entirely forbidden in nine cities (New York, Chicago, Jersey City, Baltimore, Louisville, Ky., Newark, Paterson, N. J., Syracuse, N. Y.). In two others it was retained only to repel violence (St. Paul, Minn.), or in unclassified schools (Cleveland). (2) As a last resort ("must be avoided, if possible," "in extreme cases"), corporal punishment was retained in nineteen cities. (3) No rule, but abandoned by common consent (Philadelphia), and an implicit regulation against corporal punishment is found (Omaha).

Where corporal punishment is retained as a last resort or otherwise, certain restrictions are found to the effect that teachers must keep a record, notify the principal, report to the superintendent, inflict the correction in the presence of others, teachers, principal or superintendent. In some cases the principal or vice-principal alone has the right of administering corporal punishment; in other cases parents must be notified of the intended punishment, and in one case (Kansas City, Mo.) the parents may inflict the punishment instead of the teacher. In St. Louis, Mo., the practice is left to the discretion of the principals without any encouragement by the board of education. Generally the punishment must not be inflicted

PUNISHMENT, HYGIENE OF

in the presence of the other pupils or during the school session. In many instances corporal punishment is limited to male pupils, or pupils below high school (Atlanta, Ga., Boston, New Orleans, La., San Francisco, Cal.) or below grammar grades (Providence, R. I.), where specified means are confined to a strap or rattan, and blows must not be administered on the head or face. I. L. K. and J. E. G. de M.

PUNISHMENT, HYGIENE OF. — First of all the obvious matters in regard to the hygiene of punishment should be mentioned. Severe corporal punishment should never be inflicted, blows on the head, cuffing the ears, severe flogging, standing on one foot or in difficult postures, and the like, and, as a rule, the keeping of children after school to study, the imposing of long tasks like the committing to memory of long passages of literature, the learning or writing of long lists of words, copying the same word 100 times, writing exercises with the left hand, and bizarre and unusual punishments in general, should all be prohibited.

Recent studies have shown the danger of premature or perverted sexual developments as a result of corporal punishment, the danger of developing masochism in the individual punished and sadism in the teacher and other pupils who see the punishment. So many cases have now been reported, that the statement of some hygienists that there is no harm in certain forms of punishment, especially on the posterior parts of the body, seems unpardonable.

Further, the grave results that may come in case of the punishment of nervous and sensitive children have been shown, the danger, for example, of arousing anti-social feelings that may last all through life. Many of the criminals, anarchists, and the like, are thought to owe their hatred of society to unjust punishments in childhood. The study of suicide among children shows that one of the most frequent causes of this is punishment. In the

study of 1152 cases of suicide among children, Dr. Eulenberg found the reason assigned in 336 cases was fear of punishment; and reckoning with this, fear of examination and humiliation at lack of promotion, the number was increased to 423, more than a third of the total number.

The danger to the mental health in more subtle ways, by causing worry, sense of shame, a loss of normal self-assertion and courage on the part of sensitive children, and the development of the habit of antagonism, and perhaps in some cases defiance and disregard for law and hatred of society among the stronger minded children, and withal the probability of developing morbid and unwholesome mental habits, suggest the danger of improper punishment to the mental health.

It is of fundamental importance that punishment should be individualized. Extremely nervous and sensitive children should never be punished. Of course the discipline of such children is important, but this should be given in the form of mental regimen or mental therapeutics, in other words, they should be treated as nervous patients requiring special care and attention and special training, and then punishment should come in the form of deprivations or the like imposed upon them in the interest of hygiene or medicine. Again, children of extremely conscientious character and abnormal sense of justice should be punished by a method adapted not only to their faults but to their temperament.

Punishment should be differentiated according to the age and psychological stage of development. With young children, force and corporal punishment, and deprivation of privileges in the way of dainties and the like may be in place; but with adolescents, any form of punishment that impugns the individual's sense of honor and personal freedom is likely to be unwise. The adolescent is unconventional and has a keen sense of honor, although his motives and actions may be very contradictory. Punishment, if possible, in such cases should be the natural result of the fault committed, not a factitious penalty which degrades and humiliates or in any way reflects upon the individual's character or honor as a person, or upon the individual's motives, imputing an intention of wrongdoing.

Among younger children the crude and more primitive methods of punishment may sometimes be even better than the higher and apparently more civilized forms. A sense of justice and of proper balance between wrongdoing and punishment is often beyond the appreciation of the young child, and some children who resent a punishment as unjust may be quite satisfied when the same punishment is inflicted without any appeal to high ideals, merely because the one who punishes is stronger and places it upon the low level of revenge. But hygiene raises grave doubts

in regard to such punishment after the early years. Corporal punishment should seldom, if ever, be resorted to in the school, and, while there may be a question about the advisability of corporal punishment in case of younger children, at the age of puberty and thereafter there seems no justification for it. A blow is recognized as an insult in case of an adult. The corporal punishment of soldiers is forbidden. No one can maintain, argues Traugott, that discipline in the German army has been decreased since whipping and the like were abolished; on the other hand, the German army since then stands morally higher and is more efficient and trustworthy. If an uncultured underofficer in anger cuffs a soldier on the ears, he is punished for his misconduct. If a cultivated teacher, whether angry or not, cuffs a child on the ears, this is not called mistreatment of children, but a justifiable means of education. "Where is the difference?" W. H. B.

PUNISHMENTS AND REWARDS —

These terms may be used with a wide or a narrow meaning. In the wider sense punishments and rewards are the bad and the good consequences of our acts. Thus for putting his finger in the fire the child is punished with the pain of a burning. He is rewarded for his study with power to read, etc. In the narrower sense punishment is suffering or deprivation intentionally inflicted upon an offender for an infraction of a law. Reward is the unusual possession, privilege, or enjoyment bestowed upon one who has displayed especial excellence in some field approved by the donor. The broader and narrower meanings of these two terms tend to be confused in ordinary thought. Natural consequences are put side by side with artificial penalties and rewards. This is especially true with punitive men and with the child, by both of whom natural events are often regarded as the outcome of wills, or, on the other hand, the rules of society or the commands of individuals treated as though they were the inevitable laws of nature.

If we take punishment and reward in the narrower sense, we note at once that society

PUNISHMENTS AND REWARDS

has relied primarily on punishments to bring about law and order. Similarly the school has usually fallen back on penalties as a means of preserving discipline. The sanction of the law is in jurisprudence the punishment of its violation. Both the state and the school have been interested in the realization and the preservation of a standard type of conduct to which all were expected to conform. The predominance of this conception and method in the school has been seen in the extent to which failure to learn has been penalized. Slowly, however, the idea has made its way that one should not be punished for mental shortcomings, but only for moral offenses. The result has been that penalties have more and more come to be restricted to such conduct as interferes with the work of the school. The more positive appeal of the reward has come to be the main reliance in getting the progress in knowledge and skill which it has been the business of the school to promote.

The school has come not only to employ rewards, or positive incentives, rather than punishment, but it has also reformed the character of both agencies, so as to get better educational results than at first. This may be best shown by studying the varieties of punishment and reward and noting their history.

Types of Punishment.—We may roughly divide punishments into four classes. (1) corporal punishment, (2) confinement and detention, (3) disgrace, (4) deprivation of privileges or rewards.

Corporal Punishment.—Historically, corporal punishment has been so important that a special account of it will be found in the preceding article under PUNISHMENT, CORPORAL.

Confinement and Detention.—These punishments are in general analogous to imprisonment. They vary from actual solitary confinement in a school prison to keeping a pupil in restraint in the schoolroom while others are having a recess, or after they have gone home. The school prison has been employed especially by military schools or those having in part a military régime, and the prison is like the "guard house." When pupils are confined in the schoolroom, usually they are set at some school task. When they are punished for a failure to get certain lessons, the learning of these is the natural penalty. On the other hand, when pupils are detained for disorder, etc., it has usually been the custom to require them to do some additional study not prescribed to others. One of the commonest of such tasks is the memorizing of a certain number of lines of prose or poetry. This penalty comes down from the Middle Ages and was common in English schools, where the learning of lines in Latin or Greek was one of the principal punishments. The custom was also introduced by English masters into some American schools, the prose or verse

PUNISHMENTS AND REWARDS

being sometimes in English instead of in the classical languages.

Disgrace.—In a sense all punishment is disgrace, although where this result is not directly intended a pupil who bears a severe penalty with courageous indifference may be lionized by his comrades. The forms of disgrace range from common scolding to ceremonial public reproof. Notes of complaint to parents, a roll of dishonor displayed publicly, low grade in deportment, are methods much employed in American schools. Ridicule is one of the most potent, as well as most dangerous, forms of disgrace.

Deprivation of Privileges or Rewards.—Here we have a wide range of devices dependent largely upon the organization of the school work. Where pupil associations exist, or any measure of self-government obtains, the penalty of exclusion from or deprivation of certain offices or responsibilities that are held in honor is a most effective penalty. Where certain rewards for good conduct, as holidays, excursions, early release from school, etc., prevail, there the exclusion from them constitutes a penalty. With older children, the extremer punishments of suspension or expulsion from school are employed. It is to be noted that deprivation of privileges almost invariably involves disgrace.

Nature and Function of Punishment.—In discussing the tendencies of the school with reference to the use of these various penalties it may be helpful to consider the theories of the nature and function of punishment. Four principal conceptions exist: (1) retaliation, (2) example, (3) the protection of society, (4) the reformation of the offender. The theory of retaliation is an endeavor to justify punishment on the ground that what you have done to others can with fairness be done to you. By it the instinct of justice, of vengeance, is realized through the interference of society. The individual may be too weak to protect himself, to avenge his wrongs. Society equalizes matters, and those who on account of superior strength or cunning might outrage others with impunity are treated as they have dealt with their fellows. Retaliation constitutes a very simple and easily understood theory of punishment, and one that appeals immediately to the sense of justice of both primitive men and children. It finds, however, little place in the school practice, except where a child has intentionally hurt another, or deprived him of his possessions or privileges. In that event the best penalty is often a retaliatory one. The bully should be whipped, and this is, perhaps, the one case that justifies corporal punishment.

Punishment for the sake of example justifies itself merely on the ground of expediency. It is very common among teachers. It is an attempt to terrify the social group by the spectacle of what awaits the offender. It

often gains a large measure of success. This success is, however, frequently purchased at the expense of the resentment, not only of the one punished, but also of the spectators. Since its aim is to terrify, it is apt to create an antagonism between teacher and pupils. This will be especially likely to happen in case the punishment is made unduly severe, as is the temptation where exemplary effects are sought. Only where the punishment is just in itself is its use as an example either justifiable or safe. In the school, exemplary punishment is apt to do more harm than good.

Punishment for the protection of society consists in restraint upon the offender to prevent a repetition of the offense. (See PENALOGY, EDUCATIONAL ASPECT OF.)

The history of school punishment has shown progress away from mere exemplary or terrifying punishments toward those that are positively educative. The gradual disappearance of corporal punishment has been due especially to the rise of a humanitarian spirit, and to the discovery of the futility of such penalties, but beneath it all there has been a feeling that such treatment is educationally debasing. It teaches the young to regard physical pain as the worst of evils, when the moral judgment of society holds that other inflictions are really more to be dreaded. We do not want to teach children to fear pain, but rather to love righteousness. Similarly, confinement and detention, although they offer opportunity for reflection upon evil conduct and its consequences, are not calculated to reveal in a positive way the desirability of moral excellence. We have seen that detention is apt to be coupled with the requirement of a certain amount of work. Since such work is a penalty, its infliction naturally creates a hatred of it. If, as is common, it is similar to other school work, this dislike is apt to spread. Thus, punishment creates a hatred of that in which it is the business of the school to inspire interest.

That some form of disgrace, such as reproof, must always be a main factor in discipline, we cannot doubt. The penalty is, however, beset with dangers. In the first place, it may become so commonplace as to inspire indifference. On the other hand, when the disgrace is keenly felt, its effect is often to break the spirit. Such a result is educationally bad. The school aims not to humiliate, but to instill self-respect. Finally, of all penalties, disgrace is most apt to inspire resentment, and thus to prevent rather than to secure the reformation of the offender.

The deprivation of privileges or rewards is of all the types of punishment that of most positive value educationally. For it directs attention toward some desirable thing which the school wishes the child to be eager to attain. Hence, while it is plain that at present the penalty is limited to few occasions, we see in it a type of the most desirable discipline both

in life and in the school, a discipline that teaches values rather than disadvantages, and inspires with hope of reward rather than with fear of disgrace or pain. It is evident that in the history of punishment the tendency has been toward those penalties the effect of which is to emphasize positively the ideal good things toward which education is pointing. This tendency carries with it, as we have seen, a drift toward the use of rewards rather than penalties.

Rewards.—Rewards, like punishments, differ greatly in their educational effects. We may classify them as follows: (1) prizes, (2) honors, (3) privileges, (4) honor societies, (5) special advancement. From the educational point of view, it would seem that the best reward would be the one that would most clearly direct attention toward the true aim which the conduct or the study concerned exists to promote. It follows that rewards should be as far as possible the intrinsic results of the school work. These should be in evidence as much as possible, and in order to emphasize them the school may employ to advantage the artificial accentuation of rewards.

Prizes.—These have been used from time immemorial, yet there is constant drift away from them. The reason would seem to be that gifts of this or that material thing are not natural consequences of school work, and fail to cultivate directly a taste for it. Of all prizes, books or other materials used in study seem most nearly to approximate intrinsic rewards for the pursuits of the school. Money prizes, while apt to be highly valued, are, unless they take the form of scholarships or opportunities for study, not especially appropriate as school rewards, and in consequence have not been much employed.

Honors.—Of all the kinds of reward, honors have been most frequently employed by the school. The varieties of honor include incidental commendation, special attention from the teacher, scholarship grades, rolls of honor, positions of precedence in the class, special parts in graduation exercises, and so on. All kinds of rewards carry with them honor. Many prizes, such as medals or the "crown of wild olive," have little or no value except for the distinction of getting them. It might seem, therefore, as though honors are the natural reward for school work. However, two objections may be made against relying entirely or even largely upon them as incentives to excellence: (1) honor as such is not a consequence of good conduct or mental attainment any more than of anything else that is excellent; (2) honors can be given only to a few or they cease to be honors.

Privileges.—The privilege can be extended more widely than the honor. Indeed, there is no reason why privileges accessible to all should not exist. Relief from surveillance as a reward of good conduct, relief from tasks as

PUNISHMENTS AND REWARDS

a reward for scholarship, admission to the use of special books, apparatus, or materials for study or to special forms of enjoyment associated with school life are but a few of the many forms that privilege may take. It is evident that the privilege can be so contrived as to seem a natural and specific consequence of the conduct or effort to which it is attached. The positive privilege, such as new opportunities along the lines of school work, is evidently more educational than the negative one of relief from tasks.

Honor Societies. — The honor society would seem a peculiarly appropriate form of privilege, for the chance to associate with a select group is a natural consequence of attaining the standard on the basis of which its members are chosen. Many honor societies, however, afford little companionship, and membership is, therefore, merely an honor. Moreover, there is always danger that honor societies will become clannish, or snobbish, or agencies to promote any of the interests of their members as against the outsiders.

Advancement and Promotion. — In general, that privilege which is fairest, capable of being distributed most widely, connected most inherently with the nature of the work, and most likely to create a special interest in it, is advancement in the line of activity that it represents. This is especially important when this activity is seen to be one of the great pursuits of life outside as well as inside the school, so that promotion in the school is plainly advancement for life. Where success in school work means recommendation to positions or to opportunities after one leaves school, there the highest incentive to excellence is attained. So important and far-reaching a reward needs to be bestowed with especial care, and many, indeed, are the opportunities for injustice in its distribution. On the other hand, there can be no doubt that here we have the reward upon which the school not only should but is coming to place its reliance. The organization of the life of the school so as to make the prize of promotion in some great human activity the fundamental incentive all along the line has not yet been made, but we are certainly tending toward it. PUPILS' RIGHTS

PUPIL GOVERNMENT. — See SELF-GOVERNMENT.

PUPIL TEACHER. — See ENGLAND, EDUCATION IN, EXAMINATIONS.

PUPIL TEACHER SYSTEM. — See ENGLAND, EDUCATION IN, TEACHERS, TRAINING OF.

PUPILS, ORDER AND CONTROL OF, IN SCHOOLROOM. — See SCHOOL MANAGEMENT.

PUPILS' RIGHTS, DUTIES, AND OBLIGATIONS — United States — The school laws of every state contain somewhat minute information on these topics. The rights of pupils consist largely in the right to attend schools until they have completed the course of instruction (in many states specified as from six to twenty-one years of age), and to receive proper instruction and care. The enforcement of the compulsory education laws (see ATTENDANCE, COMPULSORY; and CHILDHOOD, LEGISLATION FOR THE CONSERVATION AND PROTECTION OF) and of the child labor laws (see CHILD LABOR) is now usually regarded as protecting the educational rights of children. California calls its compulsory education law "An Act to enforce the Educational Rights of Children." Repeated Supreme Court decisions have confirmed the rights of the state to compel the attendance of children. The following decisions cover this right of the state: —

- Comp. vs Roberts*, 150 Mass., 372.
Quigley vs State, 3 Ohio Cir. Dec., 310; 5 Ohio Cir. Cl., 624.
Comp vs Hammer, 9 Pa. Dist., 251.
State vs McCaffrey, 60 Vt., 85.
State vs McDonald, 25 Wash., 122.
State vs Bailey, 167 Ind., 321.
Lynn vs Essex Co., 148 Mass., 148; 153 Mass., 40.
Reynolds vs Bd. Educ., 33 N. Y. App. Div., 88.

In return for this right to attend the schools provided, the state very properly requires of pupils that they attend to their studies, be prompt and punctual in attendance, properly excuse all absences, give proper attention and deportment, obey all reasonable rules and regulations, and submit to proper punishment for disobedience. By laws, rules and regulations, and court decisions, the teacher has been made to stand *in loco parentis*, and has had delegated to him so much of the authority of the state and the power of the parent to restrain and correct as is necessary to meet the needs of the situation he is employed to manage. The teacher is not to inflict wanton, malicious, or excessive punishment, and must exercise judgment and discretion, but if this is done, he is not liable for arrest for assault and battery, or to suit for damages. The following Supreme Court decisions cover these points: —

- State vs Burton*, 45 Wis., 150.
Fitzgerald vs Northcott, 4 F. and F., 650.

PUPILS' RIGHTS

State vs. Webber, 108 Ind., 31
Rullison vs. Post, 70 Ill., 507.
Hutton vs. State, 23 Tex. App., 380.
Hathway vs. Rice, 10 Vt., 102.
Rhall vs. Bd. Educ., 40 N. Y., App. Div., 412.
Bourne vs. State, 35 Neb., 1.
Russell vs. Lynnfield, 110 Mass., 305.
Burdick vs. Babcock, 31 Iowa, 502.
Fertich vs. Michener, 111 Ind., 472.

If the pupil persists in violating the laws or the rules and regulations, he makes himself liable not only to punishment, but also to suspension or expulsion, with a forfeiture, in part or in whole, of his right to attend the school. Even conduct detrimental or subversive to good order or discipline, when there has been no real infraction of a rule, may also be ground for withdrawing the privileges of the school from a pupil. Suspension or expulsion may also be incurred, though the acts complained of were authorized, or even directed, by the parent. If the teacher and school authorities act in good faith, they are not liable for any damages, though mandamus may lie to compel a board of school directors or board of education to show cause why the pupil should not be reinstated. The following court decisions illustrate these points:—

Ferriter vs. Tyler, 48 Vt., 444.
Rullison vs. Post, 70 Ill., 507.
Murphy vs. Bd. Dir., 30 Iowa, 420.
Hodgkins vs. Hockport, 105 Mass., 475.
State vs. Webber, 108 Ind., 31.
Spiller vs. Woburn, 12 Allen (Mass.), 127.
Bd. Educ. vs. Helston, 32 Ill. App., 301.
Burdick vs. Babcock, 31 Iowa, 502.
Peasman vs. Seeley (Texas Civil App., 1805), 3 W. Rep., 208.

The rules and regulations of the school board may also cover offenses committed outside of the school or outside of school hours, if the effect of such acts reaches within the school and is detrimental to the order or to the best interests of the school. This covers all such offenses as insulting the teacher outside of the school, acts of immorality committed, taking part in intemperate school or inter-school sports, and membership in secret fraternities. The following decisions cover these points. The sixth and seventh cases cited are fraternity cases, and the eighth is a football case.

Landers vs. Beaver, 32 Vt., 114.
Sherman vs. Charlestown, 8 Cush. (Mass.), 100.
Deekins vs. Gosc., 85 Mo., 485.
State vs. Dist. Sch. Bd., Dist. No. 1, Supr. Ct. Wis., 1908; 110 N. W. Rep., 232. (Bul. 7, 1908, U. S. Bu. Educ.)
Hobbs vs. Germany, Miss. Supr. Ct., 1000, 40 So., 516. (Bul. 2, 1910, U. S. Bu. Educ.)
Weyland vs. Bd. Sch. Dir., Seattle, Wash., Supr. Ct., 1900, 80 Pac., 642 (Bul. 3, 1900, U. S. Bu. Educ.)
Wilson vs. Bd. Educ., Chicago, Ill., Supr. Ct., 1908; 84 N. E., 607. (Bul. 7, 1908, U. S. Bu. Educ.)
Klitzer vs. Dir., Indep. Sch. Dist. of Marion, Iowa Supr. Ct., 1900, 105 N. W., 680 (Bul. 3, 1900, U. S. Bu. Educ.)

Boards of school trustees or boards of education may also make and enforce any reasonable rules and regulations relating to courses of

PUPILS' RIGHTS

study, study hours, graduation, etc., and pupils who fail to comply with such may be denied the privileges of the school, though some courts have held that pupils must be excused from a requirement to study a particular subject, if the parent requests it, provided such action does not prejudice the equal rights of other pupils. The following decisions are along this line:—

State vs. Webber, 108 Ind., 31.
State vs. Mizner, 50 Iowa, 145.
Guernsey vs. Pitkin, 32 Vt., 224.
Morrow vs. Wood, 35 Wis., 50.
Bd. of Educ. of Sycamore vs. State, Ohio Supr. Ct., 1909, 88 N. E. Rep., 412 (Bul. 2, 1910, U. S. Bu. Educ.)
Sch. Bd. Dist. 18, Garvin Co. vs. Thompson, Okla. Supr. Ct., 1900, 103 P., 578. (Bul. 2, 1910, U. S. Bu. Educ.)

The tendency of all of these decisions, supporting laws enacted by the states, and rules and regulations enacted by boards of education and boards of school directors, is to declare that "any rule of the school, not subversive of the rights of the child or the parents, or in conflict with humanity or the precepts of divine law, which tends to advance the object of the law in establishing public schools, must be considered reasonable and proper" (*Burdick vs. Babcock*, 31 Iowa, 502 E. P. C.).

Germany.—Children of school age have by law a right to be admitted to school in Prussia (Ministerial Decree, Jan. 21, 1882). Pupils absenting themselves must have a reasonable excuse for staying away from school. Where no justifiable cause is given, parents may be punished by police law and children may be compelled to attend by the aid of police. The teacher in the elementary school stands *in loco parentis* to his pupils and has the same rights of punishment. The right must not be exercised in such a way as to injure health. For excessive punishment the teacher is liable to disciplinary measures by the school authorities, or, where injury is done, is open to legal process for assault, in which case the penalty may be fine or imprisonment. Where a teacher punishes an innocent pupil or a pupil who disobeys an order which it is not within the province of the teacher to give, he is liable. The teacher has the right to punish pupils outside the school and school hours, and the pupil need not be a member of his class but must belong to his school. All punishments must be recorded. Pupils may be detained after school, but must not be kept beyond meal times, and must be under the supervision of a teacher. When possible, parents should be informed both of corporal and other punishments. Courses of study, hours of attendance, vacations, etc., are decided by higher authorities.

In secondary schools pupils in the three lowest classes are subject to corporal punishment, and other customary penalties may be imposed including arrest and detention, and in the last

resort, expulsion. Pupils may be expelled if they are backward in their school work, but only if they fail to secure promotion for two successive years. In other points the relations between pupils and teachers are the same as in the elementary school.

England. — It is the duty of the parent, guardian, or person liable to maintain or actually in custody of a child between the ages of five and fourteen years to cause such child to receive efficient elementary instruction in reading, writing, and arithmetic; and if such responsible person fails to perform such duty, he is liable to be brought by the local education authority before a court of summary jurisdiction and fined 20s., and provision may be made by orders for the attendance of the child at some certified efficient school (see Elementary Education Act, 1876, §§. 4, 11, 12, 37 and Elementary Education Act, 1900, § Y (2)). For cases in which whole or part exemption is permitted see PART-TIME ATTENDANCE OF PUPILS. There is no compulsion to attend any form of secondary teaching, but the court will compel a boy to return to school if he refuses to obey the order of his guardian (*Hall v. Hall*, (1749), and 721, an Eton case).

A schoolmaster has the power to punish in delegation from the parent, and the power extends to the conduct of pupils on the way to or from school (*Clarg v. Booth*, (1893) 1 Q.B. 405). The punishment must be reasonable (*Gardner v. Bygrave*, (1889) 6 T.L.R. 23); it may be delegated in secondary schools by the head master to a prefect or monitor (*Re Basingstoke School*, (1877) 41 J.P. 118). An assistant master in charge of a class has the right to punish (*Mansell v. Griffin*, (1908) 1 K.B. 160, 917). The extent of legal chastisement depends in part on the child's physical condition (*Stocking v. Collen Tunn*, (London) Sept. 29, 1900). Blows on the head are unlawful (*R. v. Hooley*, (1860) 2 F. & F. 206). The Prevention of Cruelty to Children Act, 1904 (S. 28), specially retains the right of "any parent, teacher, or other person having the lawful control or charge of a child to administer punishment to such child." Despite a contract not to remove a child from the custody of a school during term, the parent can remove such child (*R. v. Barnardo*, (1890) 2 Q.B.D. 293; (1892) A.C. 326). The parent's remedy is by writ of *Habeas Corpus* (see also *Price v. Wilkins*, (1888) 58 C.T. 680, 682). A schoolmaster has the right of expulsion for reasonable causes (*Fitzgerald v. Northcote*, (1895) 4 F. & F. 650; *Hutt v. Haileybury College*, (1888) 4 T.L.R. 623). It is illegal to detain a child for not doing home lessons, as such lessons are not authorized by the Elementary Education acts. But detention beyond school hours as a pure matter of discipline is not actionable (see *Mansell v. Griffin*, (1908) 1 K.B. 167). The managers of a school are not personally responsible to a

pupil for injury caused by an assistant teacher solely dismissible by the head teacher. The whole question of discipline and organization was dealt with by *Revised Instructions* issued by the Board of Education on 13 May, 1902. Governors or visitors of an endowed school may delegate curriculum, time-tables, choice of books, to the masters (*At v. Clarendon*, (1810) 17 Ves. 507), but in fact curricula, examinations, and time-tables are largely affected by regulations of the board of education and schemes under various acts. A master must safeguard in a reasonable fashion the goods and effects of a pupil (see *Searborough v. Cosgrave*, (1905) 2 K.B. 805 — boarding-house keeper case). It appears to be the duty of a master to take reasonable steps to protect the public from the mischievous acts of children (*King v. Ford*, (1816) 1 Stark 421), though apparently no action lies against the schoolmaster on the ground of nuisance (*Harrison v. Good*, (1872) 11 Bg. 352, and see *R. v. Pearce*, (1898) 67 C.T. 812). No pupil can, on the ground of religious belief, be excluded from or placed in an inferior position in any school, college, or hostel provided by a local education authority (Education Act, 1902, S. 4). An evening school is not an elementary school, and there is no compulsion to attend such school (Education Act, 1902, S. 22 (11)). J. B. C. D. M.

PURDUE UNIVERSITY. — The land grant college of Indiana, established under the Morrill Act (q.v.). Organization was effected on May 2, 1860, and because of donations of land and money by John Purdue and other citizens of Lafayette, Indiana, the institution was located at that place and named by act of legislature, Purdue University. The first classes were organized early in 1874.

The institution offers courses of study of college grade in the natural sciences, technology, and agriculture, conferring upon its graduates the degree of Bachelor of Science. It is co-educational. The different schools of study are as follows: agriculture, civil engineering; electrical engineering, mechanical engineering, chemical engineering; science; pharmacy. In addition to the above, departments of instruction are maintained in English, mathematics, history, modern languages, economics, education, military sciences. Other subordinate branches of the University are the Agricultural Experiment Station and the department of Agricultural Extension.

The organization of the University consists of the board of trustees, nine in number,

PURITANS IN EDUCATION

appointed by the governor for terms of six years each; the faculty of instruction, numbering 100 persons; the staff of the agricultural experiment station, numbering forty persons; and the staff of the department of agricultural extension, numbering five persons.

The institution is maintained by the proceeds of the land grant originally donated to the state of Indiana by Congress; by various supplementary acts of Congress appropriating funds from the federal treasury; by the proceeds of a tax of one-tenth mill on each dollar of property in the state of Indiana, by statutory appropriations to the experiment station and department of agricultural extension, by student fees; and from time to time by specific appropriations of the state legislature for special purposes.

There are 277 acres of land, twenty-one principal and twelve minor buildings. The title to the property of the University is vested in the state and is valued as follows, lands, \$120,000; buildings, \$1,004,500; equipment, \$510,347, total value, \$1,634,847.

Student attendance reaches 2000 annually, and 363 degrees were conferred in 1911. Over 3000 students have been graduated, and about 8000 have attended the institution for a longer or shorter period. W. E. S.

PURITY. — See SEX HYGIENE.

PUZZLES, PSYCHOLOGICAL — Puzzle material has been employed for the study of habit formation, transfer of training, thought processes, and interests, and it has also been used to some extent for mental tests. It has been applied to the study of the mental life of animals, children, primitive peoples, and of the feeble-minded as well as of normal adults. Lindley has classified puzzles into five groups: language and word; mechanical, mathematical, logical and philosophical, dilemmas of etiquette, ethics, etc. The characteristic puzzle features are, however, not limited to the conventional puzzles. Among the Binet tests the sentence building, absurd statement, problem question, and geometrical design tests are of the puzzle type. This is also true of the questions employed by Buhler, Woodworth, and others in the study of the thought processes. Practically every form of mental test has something of the puzzle quality when taken by the subject for the first time.

Puzzles of the mechanical and mathematical types involving actual physical manipulation offer some distinctive advantages as a means of studying mental processes. Many of them can be employed independently of

PUZZLES

verbal means of expression and so can be used in the study of the mental life of animals, of human beings with undeveloped or defective linguistic ability, due to whatever causes, and of those of a different language from that of the experimenter. These puzzles make possible a study of behavior and reveal processes which would not be evident even were there no linguistic barriers. The labyrinth and the puzzle-box methods of studying animals were brought into prominence by Thorndike, *Animal Intelligence*, 1908, and have been widely used. The maze or labyrinth requires only locomotion on the part of the animal, while the puzzle-box necessitates the manipulation of some mechanical device such as a lever, bolt, pulleys or combination of these. The animal is punished for failure, or rewarded for success, or both. The time of learning for successive trials and the number of errors are plotted as curves of learning, or habit formation. The labyrinth method has been employed with the crab, crayfish, frog, turtle, fundulus, guinea pig, white rat, dancing mouse, chick, sparrow, pigeon, and monkey. The puzzle-box method has been used especially with cats, dogs, rats, raccoons, sparrows, and monkeys. The success of the animal is naturally a function of his motor and sensory equipment, and of his habits and instincts as well as of a hypothetical "general intelligence." The rat excels in learning the maze, the raccoon and monkey in dealing with locks. The two latter animals have learned to open boxes fastened by four devices which it was necessary to manipulate in a fixed order. The raccoon has retained memory of single simple devices for a period of one year. The higher animals show some transfer, usually positive, when given a new device only partly similar to the first.

Kinnaman made a comparative study of adults, children, and monkeys in learning the combination lock. There were two individuals in each of the three groups. The times required for trials one and two are given herewith —

	ADULTS		CHILDREN		MONKEYS	
	Seconds		Seconds		Seconds	
Trial 1	11	30	105	20	130	187
Trial 2	2	1	6	3	110	23

The behavior of the children seemed to Kinnaman to resemble more closely that of the monkeys than that of the adults. Woodworth used the same apparatus in studying the primitive peoples at the St. Louis World's Fair. Lindley found that young children, grade III, profited very slowly in dealing with a complex unicursal or maze puzzle. He found the age of greatest puzzle interest to be twelve years. He thinks that ability to solve puzzle

zles is correlated positively with originality, inventiveness, and practical capacity. Terman employed a number of puzzles in a study of "bright" and "stupid" children. He found the rank of the children to be approximately the same in the different tests and to agree closely with the school rating.

The presence in the Binet Tests of material of the puzzle type has been mentioned. The "form board," used especially by Noisworthy and Goddard, has met with favor in tests of feeble-mindedness. Blocks cut into geometrical forms are to be placed as rapidly as possible into similarly shaped indentations in a board.

Practice curves may be taken very quickly and easily with mechanical puzzles as compared with more complex activities such as learning shorthand, telegraphy, or a foreign language. There are fewer elements and fewer associations to be formed. Method plays a large part in the acquisition of skill. The methods may be hit upon by chance or by anticipation, but they seem to be most effective when used reflectively and critically tested as hypothesis. Minor details of manipulation become problems similar in character to the original one of solving the puzzles as a whole. Puzzle material is usually rather unrelated to the subject's experience, so that he has no specific habits ready to cope with the problem. For this reason his attitudes—emotional, attentive, volitional—and his methods of thinking come to have special significance and prominence. The puzzle often gives the suggestion of impossibility, and determination is necessary to keep oneself at the task. Irrelevant details may be quite prominent as compared with the significant ones, but this is true also of problems of everyday life. The number of possible ways of beginning is usually very great. One must beware of falling into a rut, he needs to keep his assumptions flexible, to classify the possibilities, and critically evaluate them. These conditions of efficiency in solving puzzle problems seem to be similar to those involved in meeting novel situations in general. If these conditions are analyzed out and set up as ideals of method, positive transfer of a very valuable sort may result. Similarly positive transfer from mathematics, *e.g.* to puzzle-solving, seems to be in these methods of thought control rather than in specific habits or information. There seems to be in school work a special lack of training along the line of dynamics, of the capacity at least of working out the pathway of a point moving in three dimensions. Mechanical puzzles furnish good opportunities for the study of transfer within a single system, that is, from one puzzle to another. In the Chinese ring puzzle, for example, if the general principle has been developed during the solution of the puzzle in one form, the specific habits developed in that form can be directly and positively carried

over to another form. If no general principle has been developed, the subject is likely to experience great difficulty. Puzzles offer a wide range of material for the study of the transfer of general and specific elements. At one extreme there may be little in common except these generalized methods of thought control; at the other, the specific habits may be almost identical.

Two marked advantages possessed by puzzle material as tests of intelligence are: (1) independence of verbal expression, and (2) the possibility of training subjects to practical equality in the manipulation of some form, testing their capacity to handle variants from that of different degrees of remoteness and thus getting at intelligence rather than training. Short practice series are better as tests than single trials. Puzzles should be so chosen that it is possible logically to limit the number of possibilities of solution and to develop a rule of procedure to apply to new cases.

PYTHAGORAS (c. 580-500 B.C.).—The earliest educational theorist of Greece and the most learned man of his time, was a native of Samos and a pupil of Anaximander and Pherecydes. After gathering stores of knowledge from many lands, he established a school at Croton in Southern Italy. Here he organized a brotherhood of disciples, who lived under strict ascetic rule and aimed at a perfect life. The society was secret and had a high ethical and reformatory character. Pythagoras was the first man in the western world to establish an ethical institution apart from the state. He insisted upon mental and physical soundness, morality, and self-control. He held that all good consists in order and proportion, and that the aim of education is to find for each person his rightful place and make him efficient therein. The Pythagoreans were masters of all the sciences known, especially mathematics, and combined with the study of these the pursuit of many arts and crafts. The fraternity gained a great reputation for virtue and knowledge, but became entangled in politics, and its members were driven as fugitives into all parts of Italy and Greece. It continued to exist for some three centuries and exerted a deep and abiding influence. The ethical principles of Pythagoras and the practical morality of the society are embodied in the *Golden Words*, which are the only literary legacy they have left us.

QUAKERS — See FRIENDS, EDUCATIONAL INFLUENCE OF

QUALIFICATIONS OF TEACHERS. — See TEACHERS, QUALIFICATION OF

QUALITY — The characteristic of a sensation that makes it different from every other. The doctrine of specific energies assumes that the quality of a sensation is related to the peculiar sort of nerve ending that receives it. The theory derives plausibility from the fact that the same nerve-end always responds in approximately the same way, no matter what the stimulus may be. It is probably true only within limits, but serves as a convenient principle for the classification of sense qualities. The number of simple qualities is uncertain, but in the narrowest sense there are probably not more than fifty. An enumeration of qualities will be found under the different senses.

QUESTIONING. — Uses of Questions — There are three somewhat distinct uses of questions observable in the present practice of teaching, which are as follows: (a) *As Tests of Knowledge.* Then most common use is as a test of knowledge, of the memory and the understanding of facts. Illustrations are found in any list of examination questions. (b) *As a Means for developing Subject Matter.* Questioning is also extensively relied upon by some teachers as a means of presenting new subject matter. In any subject where there is a close sequence of thought, it is often possible to use certain fundamental facts as a means for deducing others, until an entire topic is taught. Many parts of most studies in the elementary school are taught in this way, even including literature. This plan has been most extensively followed in Germany by Ziller and other disciples of Herbart; and Germany has exerted a very marked influence toward popularizing this method of instruction in the United States during the last twenty years. This use of questions is intimately related to that of Socrates, although it is much more constructive than his method often was. Its popularity among the Germans is indicated in the fact that such instruction has been known among them as "darstellender Unterricht," or instruction that leads to an especially graphic realization of the ideas presented. The questions proposed are supposed to be in such close sequence, and so intimately related to the experience of the pupils, that the latter enter into the spirit of the subject until they "see" the situation as though it were real. Of course such vividness is due in part to the fact that the pupils themselves are allowed to contribute some of the thought. (c) *As a Means for developing the Independence of Pupils.* A third use of questions aims primarily neither at testing knowledge, nor at developing a topic — although it may do each of these to some extent — but rather at the pupil's

growth in self-reliance. In this case, the object is to ask only such questions as are necessary in order to start the pupil off alone, or to keep him going, in the mastery of a topic. All three of these uses of questions may be found in a single recitation, although, strange to say, the third use is very uncommon.

Skill in Questioning.—(a) *When using Questions as Tests of Knowledge.*—One difficulty in putting questions is to secure a wording that is clear and definite enough to get what is wanted. In desiring to teach the fact that soil is largely composed of rock-bits, a teacher asked, "What do you find in the soil?" thus allowing any number of answers without necessarily including the one in his mind. Even in so simple a matter as this, the right question is not easily found. A second difficulty is to make the questions sufficiently broad. Many examination questions lack scope, and owing to their narrowness, they direct attention away from the more fundamental portions, the principles, of a study, to its minor aspects. It is very common for teachers to ask from 100 to 200 questions in a single recitation period of thirty or forty minutes, and also to get the answers to all or most of them within that period of time. That number alone indicates how narrow and detailed questions commonly are; for comparatively few questions of much scope can be satisfactorily answered within forty minutes. The secret of the scrappy responses of children in class is found, to a large extent, in the scrappy character of the teacher's questions.

(b) *When using Questions for the Development of Subject Matter.*—When questions are largely depended upon for the unfolding of a new topic, a much higher degree of skill is demanded. For in an examination by questions, each question is usually considered alone, the teacher merely keeping in mind what constitutes a good question. But a good series of questions is necessary in development instruction, involving their grouping according to superiority and subordination, and their sequence. In other words, organization of questions is an important matter here, as important as organization of thought is in composition in general. It is not merely logical or scientific organization, either, that is needed. Such insight into the subject matter as would insure that kind of organization is to be presupposed, for one cannot hope to word good questions on a topic without thorough comprehension of the topic itself. But the organization to which such knowledge should lead is that based on the learner's own interest and method of approach—called the psychological organization in distinction from that which is merely logical or scientific. That kind presupposes an equally thorough comprehension of the learner's abilities and tendencies, in addition to other knowledge. It calls for questions dealing with facts, and

also for others dealing with feelings, particularly feelings of value; and teachers accustomed to fact questions alone often find it extremely difficult to word the kind that tests appreciation. Perhaps enough has already been said to suggest that real skill in questioning, particularly in questioning so as to unfold a new subject, is made possible only through a thorough knowledge of subject matter and of method.

(c) *When using Questions for the Development of the Student's Independence.*—Questions aiming at growth of pupils' independence require knowledge of the subject and of the pupils' past experience, as just stated, with a peculiar appreciation of the present ability of the learner. For in this case, the questions, aiming to transfer the leadership from the teacher to the student, are concerned primarily with the latter's power to work. A series of questions having this object would be radically different from, and even more difficult than, a series aiming only to unfold a subject.

Merits of Questioning, as a Method of Instruction.—A method of instruction that makes much use of good questions possesses two important merits. In the first place, it compels special pointedness of thought. One can listen to a lecture or study a text, and reproduce the whole without focusing the attention on the exact points that are made. Indeed, that is easy for one who has a good verbal memory. But a pointed question forces one to think by "points." In the second place, good questions make the learner an active participant in the thinking that goes on, thereby fulfilling one of the most prominent conditions of good teaching.

Ages and Subjects for which Questioning is Suitable.—The use of questions for testing knowledge is generally considered fitting for all ages and subjects. Their use otherwise, however, is in much dispute. For instance, while the elementary school is generally expected to resort to questions extensively, the custom in colleges and universities is very different. Yet there seems to be no fundamental reason for this difference; for, outside of professional schools, the growth of the student is the aim alike in school and in college, and the psychological arguments are practically exactly the same in the two cases. One valid reason for some lecturing in these higher institutions is the large size of some of the classes. But aside from that consideration, the large amount of lecturing there seems to be due to conservatism only. It is an inheritance from a time when textbooks were wanting and when method of teaching had received little study.

QUESTIONNAIRE — A list of questions used for the purpose of securing information. The "questionnaire" method has usually been employed in statistical inquiries, e.g. the census, immigration returns, labor reports, etc. The method was borrowed by the psychologists, to secure information on the different phases of child life. Questionnaires were sent to people thought to be interested, to psychology classes, and to schools to be answered by the pupils. The results were then analyzed by the investigator, and the conclusions determined. Typical reports on such investigations may be found in the early numbers of the *Pedagogical Seminary* and the *American Journal of Psychology*. The use of the questionnaire method has been subjected to criticism in all studies which deal with opinions rather than facts. Where any attempt is made to go beyond a plain numerical answer or an answer of yes or no, there is the danger that the replies merely record the opinions of the few people who choose to reply, and these may be of no greater value than the opinion of the investigator. The further one moves from the questions of fact towards questions of subjective conditions, the greater is the likelihood of error. Further, it is very rare to obtain answers to all the questionnaires submitted, so that the replies of only a small number of people, already narrowly selected, can be dealt with. Nor do the answers in all cases completely cover the question. The final conclusions are necessarily a compound of partial responses and the subjective bias of the investigator.

There is still some place, however, for the questionnaire method, provided the questions are few in number, can be answered numerically or by "yes" or "no," cannot lead to any misunderstanding and can be answered without bias, and leave no loopholes for a partial answer. Direct expert observations of representative cases with reference to all the factors involved, combined with a moderate amount of statistical care, will lead to more fruitful results in psychology and education than the questionnaire method.

QUICK, ROBERT HERBERT (1831-1891) — English educational writer and schoolmaster, born in London the 20th of Sept. 1831. He was sent to the school at Harrow, but on account of delicate health was prepared for college by private tutors. He graduated in the mathematical tripos at Trinity College, Cambridge, in 1854. He was ordained in 1855 and for three years worked as an unpaid curate. The memory of his own school days, and the antiquated methods employed by his teachers, directed his attention to education as a career.

Mr. Quick gave up his parish work in 1858 and accepted a mastership in the Lancaster Grammar School. He passed in rapid succession to similar posts at Guilford, Hurstpierpoint, and Cranley. In 1870 he became assistant master at Harrow, and from 1874 to 1881 he was head master of secondary schools at London and Guilford. In 1881 he was appointed by the University of Cambridge to give the first course of lectures on the history of education at that institution. He was also active in the Teachers' Guild of Great Britain and Ireland (q.v.), and other agencies having for their object the professional improvement of teachers.

Mr. Quick owes his large place in education not so much to his work as a schoolmaster, although in this he was distinctly progressive and much in advance of his time, but chiefly to his educational writings, and primarily to his book *Educational Reformers*. This has unquestionably been the most influential book on the history of education ever published in the English language, for Mr. Quick, very properly writes Frederic Storr, "was the first among English writers to succeed in making a book on education readable, and at the same time sober and rational." He got the inspiration for his *Educational Reformers* from the *American Journal of Education* by Henry Barnard (to whom he dedicated the revised edition of his book) and Schmid's *Encyklopädie der gesamten Erziehungs- und Unterrichtswesen*. It has become an epoch-making book, because Quick caught the spirit of the reformers whom he interpreted; and, in his running commentaries on the personalities and writings of the reformers, he provided some of the most important foundations for the scientific study of education. And in this sense Quick himself was one of the greatest educational reformers of modern times.

The success of the *Educational Reformers* was due almost entirely to its popularity in America, although it has since become a popular educational book in England. Mr. Quick always maintained that the Americans kept his book alive.

Mr. Quick's other educational writings in-

QUINCY, JOSIAH

clude *Schoolmasters, Past and Present* (1879), *Improvement of Teachers* (1885), and numerous articles in educational journals. He also edited with notes and introductions Locke's *Thoughts Concerning Education* (1881) and Mulcaster's *Positions* (1888). Mr Quick collected during his lifetime a large and valuable library on the history of education, and this has been presented to the Teachers' Guild of Great Britain and Ireland. W. S. M.

QUINCY, JOSIAH (1772-1861) — Fifteenth president of Harvard University; was prepared for college at Phillips Academy, Andover, and graduated from Harvard in 1790. He engaged in the practice of law and took an active part in public life. He was a member of the legislature of Massachusetts and the Congress of the United States, and was a leader in the antislavery movement. He was also mayor of the city of Boston from 1823 to 1828. He was chosen president of Harvard University in 1829 and held the post until 1845. He was an advocate of elective studies (*q. v.*), and, remarks one of his biographers, "the elective experiment was tried more thoroughly and on a broader scale during his administration than under any other down to the time of President Eliot." His educational writings include *History of Harvard University* (Boston, 1840). W. S. M.

Quincy, E. *Life of Josiah Quincy* (Boston, 1867).

QUINCY MOVEMENT — An able, progressive, and open-minded school committee and a wide-awake and enthusiastic school superintendent originated the "Quincy Movement." Charles Francis Adams, a distinguished citizen of Quincy, Mass., was elected a member of the local school committee in the early seventies. He had made a somewhat careful study of the secondary school course and had reached the conclusion that the philological and archaeological study of the dead languages in high schools and colleges did not warrant the claims made for them as agencies in mental discipline (see his *College Fetiche*). He was equally convinced that the elementary schools, with so much emphasis upon drill in the three R's, as educational means, were equally deficient. His colleagues on the school committee shared his viewpoint, and in 1875 Francis Wayland Parker (*q. v.*) was selected superintendent of the schools of Quincy and "given a free hand." The schools were made less artificial and conventional. The children

were taken out of doors for lessons in science and geography. The character of the work in reading was shifted from drill to content upon the theory that the purpose of elementary education was not merely drill but nutrition. Special appeal was made to interest and emotional pleasure as dominating factors in all school studies; and the subjects in the course of study that could not be made interesting were not given so much prominence. The teachers were given a larger measure of freedom in the methods of instruction and the details of course of study. It was Colonel Parker's conviction that courses of study and detailed regulations were largely made for the benefit of poor teachers, and he argued that good teachers should be given some chance for initiative. Geography and nature study were given commanding places in the scheme of instruction and the sand table in the school-room and the sand piles in the schoolyards were extensively used in the development of concepts of structure. Local geography and local history (without the use of textbooks) became very live subjects. School studies were correlated. Spelling was taught in connection with the other branches; and language lessons, based upon observation of objects and concrete realities, took the place of the formal study of grammar. Great enthusiasm was developed among pupils and teachers and Quincy became the educational Mecca of New England. The summer schools for teachers that sprang into existence at this period grew out of conscious needs that the Quincy movement had created. The movement, however, met with opposition. Conservative New England schoolmen looked with suspicion upon the so-called "new education." It was claimed that Parker had turned the schools of Quincy into natural history museums and mud-pie factories. The children were amused and happy, it was granted, but did they learn the three R's? To settle this question the State Board of Education of Massachusetts decided to conduct an examination of the schools of Norfolk county. The examination was in reading, writing, spelling, written and mental arithmetic, geography, and history. The schools of Quincy came out far ahead of all the other schools of the county except in the one study of mental arithmetic. (See WALTON, G. A., *Report of the Schools of Norfolk County, Mass.*, Boston, 1880. The towns are not given by name but by letter. C refers to Quincy.) The Quincy movement clearly demonstrated the value of expert supervision and it gave an impulse to a higher order of professional training of teachers. W. S. M.

QUINET, EDGAR (1803-1875). — French teacher, writer, and statesman. So great was the success attained by him in his professorship of foreign literature at the University of Lyon, to which he was appointed in 1838, that Villemain, then minister of public instruction, created for him the chair of "southern comparative literature" (*littératures méridionales comparées*) at the College of France (1840). His lectures here provided the matter for several of his books, *Les Révolutions d'Italie*, *Le Christianisme et la Révolution française*, among others. Before long his republican and anti-clerical sentiments were responsible for the termination of his courses and the abolition of his chair. After the political changes of 1848, he was reappointed to his former position, but he soon left this for the more stirring life of the political arena. This was the period of his *Enseignement du peuple* (1850), a protest against the return to power of the clerical party in accordance with the provisions of the odious Falloux Law of that same year. During an exile of nineteen years he published his more important works, *Le philosophe de l'histoire de France* and *La révolution*, to cite only two. The turn of politics again saw him back in his native land, and he was chosen member of the National Assembly (1871). *La république, conditions de la régénération de la France* (1872), and *L'esprit nouveau* (1874) were the last publications of this most fecund writer. Throughout his life he struggled with pen and voice for those great principles of compulsory, free, and lay education which Jules Ferry (*q. v.*) finally succeeded in putting on the statute books of France in the early eighties. No one fought more heroically for these reforms than Quinet, and it seemed the irony of fate that he did not live to see these principles triumphant. F. E. F.

QUINTILIAN (MARCUS FABIVS QUINTILIANUS). — Roman rhetor born at Calagurris in Spain about 38 A. D. His father, a teacher of rhetoric, took him at an early age to Rome and had him educated there for the bar. After practicing for a time in his native town, he returned to Rome with Galba in 68, where he soon opened a school of rhetoric,

QUINTILIAN

i. e. grammar, literature, and oratory. Among his pupils he numbered Pliny the Younger. His school was probably endowed by Vespasian and under Domitian he was raised to consular rank. After twenty years of teaching, which seem to have been extremely profitable, he retired from active life and devoted his remaining years to arranging his materials and putting together the fruits of his long experience in the work by which he is known, *De Institutione oratoria* (*Institutes of Oratory*), published about 95. Quintilian died about the close of the first century A. D. The *Institutes of Oratory* is a work in twelve books giving the principles for the training of the "orator." The work was dedicated to Marcellus Victorius, to be used in the education of his son, Geta. Educationally the importance of the work by no means lies in the technical side of the work. But in the first two and in the last book Quintilian considers the aim of education and the preliminary training which he regarded as fundamental for the equipment of the orator. "I am of opinion," he says, "that to make an orator we must begin from the beginning and I consequently shall begin to shape the studies of an orator from his infancy. . . ." The term orator had a wide connotation with Quintilian. The orator was not merely the man who could speak, the eloquent man; he was the *vir bonus dicendi peritus* (the virtuous man skilled in speaking), he was the *vir civilis*, the citizen who employed all his skill and ability and virtue in the service of the state. Hence the training of an orator included far more than mere technique or elocution; *eloquentia* meant more than oratorical power; it included literary ability, good taste and judgment, and virtuous conduct (*optima sentiens, optima dicens*).

Quintilian believed that education must begin at a very early age. Hence care must be taken in the choice of a nurse. Actual instruction may be commenced before the seventh year. Education is necessary to prevent mental stagnation. The child can be taught the alphabet early, not merely by memory or by rote, but by actually associating the shape and sound of the letters. Care must be taken that the young pupils speak slowly and distinctly. Writing may be learned by tracing and imitating letters. When the seventh year is reached, the time for definite instruction has come. Quintilian discusses the relative merits of private tutorial instruction and the public school, and decides emphatically in favor of the latter, on social as much as any other grounds. At the grammar school the pupil will learn above all the principles of grammar or the science of speaking and writing carefully (*emendate loquendi scribendique scientia*). And first Greek grammar will be taught, Latin being taken up later. Greek is of importance in the curriculum; by it ability is secured to study the various sciences

QUINTILIAN

in the original sources. (Compare with this the argument for the classics in the Renaissance period.) After learning the elements of grammar, the pupils proceed to literature and read as widely as possible, especially such works as are marked not only by excellence of style, but by moral worth of content. Rules of style and good usage can only be acquired by broad reading and observing the usage of scholars. The grammar school is succeeded by the school of the rhetor, who gives the technical training in style and composition. While rules of style are taught by him, the independence, spirit, and imagination of the pupils must be given free play. But to these qualities must be added the acquisition of ideas from reading the works of orators, historians, philosophers, and poets, the one way of training the judgment and good taste. Here again there is an insistence on the moral worth of the content (*id quod est oratori necessarium . . . evolvendis penitus auctoribus qui de virtute præcipiunt*). To the literary subjects Quintilian adds geometry and music, the one as a mental training, the other as a part of liberal education.

Throughout Quintilian insists that the teacher respect the individuality of the child. He stands in the place of the parent and is responsible for the result of his instruction. Character, to use a modern term, must be the end of education and all instruction should be educative to that end. Corporal punishment should be eliminated entirely, and the teacher's personality and the pupil's sense of honor must take its place. The teacher must come into close contact with his pupils, and for this purpose among others Quintilian advocates relaxation and games, in which the teacher should take part. And the product of his scheme of education is to be "the true citizen trained for the administration of public and private business, who can rule cities by his counsel, make them stable by laws, improve them by judgment, no other in fact than the orator."

No other educational work exercised so much influence on Renaissance educational thought as did the *Institutio Oratoria*. It was only discovered by Poggio at St. Gallen in 1417, although Petrarch may have had an incomplete copy. Contested as the Renaissance was in the Roman ideal, the importance of the *Institutes* was recognized by all educational leaders. With Plutarch's *πρὸς παιδείαν ἁγωγὴς* Quintilian's work was for long the only educational treatise of the ancient period which was given any consideration. Vittorino is reported to have "extolled Quintilian in remarkable terms, as the best authority on life and scholarship." And Erasmus apologizes for his educational treatise "seeing that Quintilian has said in effect the last word on the matter." In Italy, Germany (Rudolph Agricola, Erasmus, Melancthon), France (Rudé, the *Collège Guyenne*, Rollin), and in England

RABANUS MAURUS

(Sir Thomas Elyot) Quintilian's ideas were widespread. And, indeed, it needed but the addition of the Christian ideal to the pagan's ideal of citizenship to make it acceptable to all educators. How far Quintilian's influence has come down in an unbroken line through Vittorino and Arnold of Rugby to the English public schools, it is difficult to say, but in large measure his ideas may be seen in the modern ideal of the "Christian gentleman."

See RHETORIC.

QUIZ — A term said to be a colloquial abbreviation of *question*. It usually means an informal examination conducted by the oral method, although sometimes loosely applied by students to short written examinations.

In college and university work the "quiz" is frequently the repetition through discussions and questions of the ground covered in a previous lecture.

QUOTIENT. — See DIVISION.

RABANUS (HRABANUS) MAURUS (784 (?)–850). — Medieval scholar and teacher, born at Mainz and at an early age sent to Fulda (*qv*) as an oblate of the order of St. Benedict. His ability soon showed itself and he was sent to Tours, where he studied under and became a favorite pupil of Alcuin, who called him Maurus after the favorite pupil of St. Benedict. He returned to Fulda in 801 but was again sent to Tours for a year in charge of a pupil (802). In 818 he was appointed head of the schools at Fulda, the *schola interior* for oblates, and the *schola exterior* for lay pupils. Rabanus was a keen student and a devoted teacher, and in a short time attracted pupils from all parts of Europe for both schools. From 822 to 842 he was abbot of Fulda and in 847 became Archbishop of Mainz. From 812 to 847 he lived in retirement and wrote the *De Universo*, an encyclopedic work based on Isidore (*qv*).

Rabanus was an ardent student of the seven liberal arts and of the classical and Biblical

literatures. He wrote Biblical commentaries, an abstract of Priscian (*Excerptio de arte grammatica Prisciana*), a *De computo*, and a treatise on alphabets and abbreviations (*De inventionibus linguarum*), and a chronological work. For educational history, his most important work is the *De clericorum institutione* (*On the Education of the Clergy*) written in 819. In this work Rabanus has frequently drawn on St. Augustine (*On Christian Doctrine*) and Gregory (*Pastoral Care*). The treatise deals mainly with the training of the clergy, but Book III deals with education in general.

That Rabanus must have owed much of his influence to his ability as a teacher may be supposed from his hints on class management. He insists on respect for individuality. Methods must be varied according to the age, ability, and intelligence of the pupils. Subjects must be presented in a clear and concrete manner; verbosity must be avoided, and instruction must be terse and to the point. Above all, pupils must be trained to be independent. That much depends on the personality of the teacher has been pointed out, but disciplinary measures, while necessary, must be exercised with discretion according to individual character (*secundum qualitatem hominis sic debet temperari disciplina magistrorum, et disciplina cum discretione*). Among the pupils of Rabanus were many who attained fame as scholars and teachers in the next generation, the most prominent being Servatus Lupus, abbot of Ferrières, Walafrid Strabo, abbot of Reichenau, Gottschalk, and Rudolph, Rabanus's successor.

RABELAIS, FRANÇOIS (1483-1553). — French humorist and satirist, significant for his influence upon the thought of Montaigne (*qv*), Locke (*qv*), and Rousseau (*qv*) rather than for any direct effect upon the education of his day. His early years are shrouded in mystery, and the first real evidence we have of his existence is when he was in the monastery at Fontenay-le-Comte (1519). Although a monk of the Franciscan and later of the Benedictine order, physician, lecturer in medicine

and in anatomy, and writer, he is best known to us on account of his literary work as humorist and satirist. He was a friend of Budéus (*qv*) and of Du Bellays. His most famous writings were *Pantagruel* and *Gargantua*, the first parts of these being published in 1533 and 1535, respectively. Though these names are not original with Rabelais, and in fact were probably names of giants well known to the people of the Middle Ages, yet the treatment by the pen of Rabelais is so bold and so novel that he is often looked upon as their creator. In his educational philosophy, he was one of the early realists, in violent opposition to the prevailing scholastic formalism of his time, but yet unable to get away from the book as the chief source of his material. This twofold tendency, a realist as judged in the light of his contemporaries, a humanist in his faithfulness to classical and book learning, has resulted in the double characterization "humanist-realist." In *Gargantua*, the manners and education of the sixteenth century are satirized in the most ruthless fashion. The training under the old scheme is an utter failure, and Gargantua is "reeducated." The physical, the moral and religious, and the intellectual elements are all carefully included with special emphasis in this last category upon scientific instruction and sane method. We find here a complete exposition of his educational ideas.

RACE PROBLEM, EDUCATION AND THE. — See IMMIGRATION AND EDUCATION; INDUSTRIAL EDUCATION; NEGROES, EDUCATION OF; SOUTHERN EDUCATIONAL MOVEMENT; also the section on educational conditions in the various articles on the Southern States.

RACE PSYCHOLOGY. — That branch of social psychology which deals with the special characteristics of particular groups of people. Thus the sensory characteristics of primitive peoples may be investigated as a special topic in race psychology. Again, the peculiar social institutions of a given people may be con-

RADCLIFFE COLLEGE

trasted with the peculiar social institutions of other nations at the same level of culture. The people of Eastern Europe have certain typical characteristics which differentiate them from the people of Western Europe. The science of ethnology deals with these and other racial differences. In so far as the differences with which ethnology deals are mental in character and are of psychological significance, the fields of race psychology and ethnology are coincident. Ethnology is a broader term, and includes also physical characteristics and the study of institutions beyond the strictly psychological institutions which would be included in race psychology. For a treatment of the broader problem and for references, see **SOCIAL PSYCHOLOGY**. C. H. J.

RADCLIFFE COLLEGE, CAMBRIDGE, MASS. — Systematic instruction of women by professors and other instructors of Harvard University began in 1879; and in 1882 the Society for the Collegiate Instruction of Women was formally organized. The work had no official relation with the University until 1894, when the name of the Society was changed, by act of the General Court of Massachusetts, to Radcliffe College. The President and Fellows of Harvard College have been constituted the Board of Visitors of Radcliffe College. The requirements for admission are identical with those for admission to Harvard College. The courses of instruction given in Radcliffe are for the most part identical with courses in Harvard, and are given by the same instructors. They are more than sufficient to enable a woman to perform the work required by the University for the degrees of A.B. and A.M. In addition to these, graduate students in Radcliffe have access to a large number of graduate courses in Harvard University. In several departments students have taken the Ph.D. degree. The number of teachers is 103. The examinations are the same in both institutions, and the diplomas conferring the degrees of A.B., A.M., and Ph.D. are countersigned by the President of Harvard University as a guarantee that these degrees are equivalent to the corresponding degrees given by the University. Mrs. Elizabeth C. Agassiz was the first President, and remained Honorary President until her death in 1906. She was succeeded in 1903 by Professor LeBaron Russell Briggs, Dean of the Faculty of Arts and Sciences of Harvard University. The first Dean of Radcliffe was Miss Agnes Irwin. She was succeeded in 1910 by Miss Mary Coes.

The Radcliffe buildings consist of two administration and lecture buildings, a library containing 25,000 volumes, a gymnasium, and three halls of residence. The students have access to the Harvard Museums, and have the use of the Harvard and Harvard-Andover Libraries. Opportunities for study in the Harvard Astro-

nomical Observatory and the Herbarium are also afforded. In 1911-1912, 566 students were registered in Radcliffe. M. C.

RAFFIA WORK. — See **HOUSEHOLD ARTS; INDUSTRIAL ARTS, MANUAL TRAINING.**

RAFINESQUE, CONSTANTINE SAMUEL (1783-1842). — Peripatetic schoolmaster and scientist; traveled and studied in Europe. He was an itinerant schoolmaster in the Mississippi Valley and for a time professor at Transylvania University. His studies of the botany and geology of the United States (some of them translated into French) represent the most extended and careful early scientific work done in America. W. S. M.

RAGGED SCHOOLS. — Institutions established in the British Isles for the education of destitute children, waifs, and strays who were not reached by other agencies or who were entirely neglected. The movement was begun largely in imitation of the work of John Pounds (*q.v.*). The schools were maintained by voluntary contributions, and in many cases the services of voluntary teachers were obtained. The aim of the schools was to give an elementary Christian education to children who would otherwise have grown up in utter ignorance and sin. By the side of the ragged schools many other activities for the social uplift of those whom they could reach were begun. Thus in connection with the Ragged School Union, established in London in 1844, there were maintained: Sunday schools, day schools, evening schools, penny banks, children's churches, parents' meetings, bands of hope, clothing clubs, ragged churches, messenger and shoeblack brigades, homes, industrial classes, etc. From 1856 the Committee of Council on Education in England gave a grant to ragged schools under certain conditions. Schools of this type sprang up all over the country and were established by different denominations. Their usefulness was largely destroyed when compulsory education was introduced after 1870. But they did a considerable service in training up as respectable, self-supporting citizens those who otherwise would have found no helping hand.

See **CARPENTER, MARY; GUTHRIE, THOMAS; MORE, HANNAH; RAIKES, ROBERT, SUNDAY SCHOOLS.**

RAIKES, ROBERT (1735-1811). — Promoter of the Sunday schools (*q.v.*), born at Gloucester, England. He became, on his father's death, editor and printer of the *Gloucester Journal*. From an early age he was much interested in social and philanthropic questions, and especially in prison reform. Through his study of the latter and his frequent visits to the working class districts of Gloucester, he saw the chief cause of degrada-

tion in the neglect of adequate training of children. In 1780 Raikes engaged a woman to take charge of a Sunday school for the depraved and vicious children. In 1783 he gave an account of his work in his *Journal*, and a letter of his on the subject was published in the *Gentleman's Magazine* in 1781. In 1783 Raikes became associated with Rev. Thomas Stock, who had already opened Sunday schools at Ashbury, Berkshire, and in Gloucester. The two engaged and paid the salary of three or four teachers to keep school on Sunday, and Raikes in addition paid to have the schools opened on week days.

Raikes attracted considerable attention by the accounts printed in his own paper and in the *Gentleman's Magazine*. He had many correspondents and many visitors, including the Duke of Gloucester. He was invited to St Petersburg by Empress Catherine. In 1787 he was elected honorary member of the Sunday School Society, which had been established in 1755 and chose thus to honor the "Founder" of the movement. It would be difficult to establish the claim of Raikes to be the founder of Sunday schools. Undoubtedly he did good work and sacrificed much money and personal energy for the cause, but many others had labored quietly in the same direction both before and during his life. It was his good fortune to have the means of attracting attention at a time when interest was already being shown in the work elsewhere.

RAILWAY SCHOOLS. — See APPRENTICESHIP AND EDUCATION, INDUSTRIAL EDUCATION.

RAMBAULT, MARY LUCINDA BONNEY (1816-1900). — Founder of the Ogontz School; educated at Hamilton Academy and the Troy Seminary. She taught in secondary schools at Jersey City, New York City, Beaufort, S. C., and at the Troy Female Seminary. In 1850 she founded a secondary school for girls in Philadelphia, subsequently removed to Ogontz. She was one of the founders of the Indian Association. W. S. M.

RAMSAUER, JOHANNES (1700-1848). — A German educator, pupil of Pestalozzi, born at Herisan in the canton of Appenzell, Switzerland. In 1800 he was taken by Pestalozzi into his school at Burgdorf, and followed him later on (1805) to Yverdon, where he was promoted to the position of a teacher in the school and, at the same time, acted as Pestalozzi's private secretary. Thus for sixteen years he lived

in closest communion with the master and imbibed his ideas. In 1810 he was appointed teacher in a newly established educational institution at Wurzburg, but in the fall of that year he accepted a call of Queen Catharine of Wurtemberg to become the tutor of her two sons, and to direct an elementary school for children of the higher classes at Stuttgart. When, after the death of Queen Catharine in 1810, her sons removed to Oldenburg, Ramsauer went with them and continued to direct their education. He also established a school for girls which, in 1836, was merged with the Cäcilien Schule, founded by Prince Peter. Ramsauer remained connected with this school until his death. He made valuable contributions to the methodology of freehand and geometrical drawing, but his chief importance lies in his splendid exposition of the work and character of Pestalozzi. Among his writings are *Zeichnungslehre (Instruction in Drawing, 1821)*; *Elements of Geometry, 1820*, *Kurze Skizze meines pädagogischen Lebens mit besonderer Berücksichtigung auf Pestalozzi und seine Anstalten (Short Sketch of my Educational Career, with Special Reference to Pestalozzi and his Institutions, 1838, 2d ed., 1880)* and the *Book of Mothers*, published at the occasion of the one hundredth anniversary of the birth of Pestalozzi in 1846. F. M.

RAMUS, PETRUS, OR PIERRE DE LA RAMEE (1515-1572). — French humanist and educational reformer. He was born at Cuth, Picardy, of humble parentage, but worked his way through the College of Navarre, University of Paris. He conceived a high esteem for dialectic, but was disgusted with the formal and useless disputations through which it was taught, and soon broke with the Aristotelianism of the day. At his master's examination in 1530, he defended the thesis: "All that Aristotle has said, is false", and in 1543, as principal of the College of Ave Maria, he crystallized his point of view on the negative side in his *Animadversions on Aristotle*, and on the positive in his *Divisions* (later, *Institutions*) of *Dialectic*. He was attacked by prominent, but pedantic, scholars; a biased commission of five decided that "Ramus has acted rashly, arrogantly, and impudently"; and the king prohibited the publication of his works and forbade him to lecture upon philosophy. Upon the accession of Henry II in 1547, however, the interdiction was removed through the influence of the Cardinal of Lorraine, and, in 1551, greater latitude was afforded Ramus by his appointment to a new chair in the College of France. He had previously (1541) become

principal of the College of Presles, and now undertook a revision of all the liberal arts, and published numerous works upon grammar (Latin, Greek, and French, as well as a general treatise), rhetoric, dialectic, mathematics (arithmetic, geometry, and general treatises), and physics (natural sciences). He also wrote treatises upon ethics and theology, and published his lectures on Cicero, Quintilian, Vergil, and Caesar. In all, he issued fifty-two works, and ten others were published posthumously. He was noted for his eloquence, and several times represented the university before the king. In 1561 he succeeded in securing a renewal of university privileges and some of the arrears in salary for the professors in the College of France. In the same year he was converted to Protestantism. In his *Recommendations for the Reformation of the University* (1562), he held that the fees should be abolished, the large number of masters be replaced by a few public professors paid by the state, that instruction be made more practical, and that demarcation be made between secondary and higher education. These last two steps alienated the Cardinal of Lorraine and the faculties, and greatly strengthened his conservative opponents. Antagonism to him was increased by his opposition to the recognition of the Jesuit College of Clermont by the University (1564), and to the appointment of the incompetent Carpentarius to a chair of mathematics at the College of France (1566). Three times (1562, 1567, and 1568) he was driven into exile with his coreligionists. On the last occasion he was enabled to visit for two years the chief humanistic centers of Germany and Switzerland, and was received with the greatest consideration by all the most renowned scholars there. He returned in 1570, but his enemies had him excluded from teaching, although it was finally arranged that he should retain his salary and devote himself to writing. He was most brutally murdered during the massacre of St. Bartholomew's Day.

Ramism. — The chief aim of Ramus in education was to free the liberal arts from barrenness and needless difficulties. The principles underlying his reforms may be summed up in three key words: (1) nature, (2) system, and (3) practice. His guide for the selection of subject matter was the observation of *nature*. The material for grammar, he held, should be derived from actual usage, — the ancient tongues from the classical writers, and the modern from the speech of the people. Logic should be based upon the observation of the human mind, and natural sciences upon the investigation of physical nature. *System*, or arrangement of subject matter, he founded upon the following principles taken from Aristotle: (a) *universality* (κατὰ παντός) or "the law of truth," whereby every precept must be true in all instances; (b) *homogeneity* (κατὰ αὐτό), or "the law of justice," whereby

everything must be germane to the particular subject, and (c) *primacy of the general* (κατὰ δόξιν), or "the law of wisdom," whereby anything that obtains throughout a subject should be stated at the outset and only then. In method Ramus arranged a plan of work through which abundant time should be given to careful explanation, insuring a knowledge of the principles and meaning of each lecture, and applying them in *practice*. There were two aspects to "practice," (a) analysis, or critical examination of the way in which a passage conforms to the rules, and (b) *genesis*, or production at first of something akin to the model, and later more independent creation. In each subject he established the practical goal of *use*, and made his definition of it from that standpoint. His organization of the "arts" rested upon *dichotomy*, or a division of each portion of subject matter into two parts. His grammar included only "etymology" and "syntax." In this "art" he sought to establish the use of *j* and *v* to represent the consonant sounds up to that time included in *i* and *u*, to improve pronunciation and to introduce phonetic spelling. *Rhetoric* was divided into "expression" and "action," and under the former he included "prose," which he had rejected from grammar. He sharply separated rhetoric from grammar on the one hand, and from dialectic on the other, excluding equally "syntax," and "invention," and "arrangement." Dialectic was treated more as the art of persuasion and exposition than of the discovery of truth, and he held that it could be learned better by observing Cicero's usage than by studying the canons of the Organon. He held it to be simply the practical art of debating a question, and refused to consider any of the preliminary metaphysical problems. He recognized the ten chief classes of arguments of Aristotle, and adopted his first three figures, but rejected the fourth. In arithmetic and geometry he eliminated all complexities. His geometrical demonstrations were clear and well arranged, and for the first time appeared in the form of demonstrations. He advocated that *physics* be studied from nature and philosophical abstraction be avoided, but actually he borrowed his material from Aristotle's *Physics*, Pliny's *Natural History*, and Vergil's *Georgics*, and arranged it deductively.

Influence. — Ramism was debated throughout Western Europe for more than a century, and left a great impression upon philosophical and educational thought. It found many advocates in France and influenced the work of Descartes and the Port Royalists. It had a little following in Spain, Portugal, and Italy, and much enthusiasm arose from its introduction into Denmark by Krag, and into the Low Countries by Naevel. In England it made little progress at Oxford, which was devoted to Aristotle, but Cambridge, through the efforts

RANDALL

of Ascham, proved hospitable. It was given vogue there by Digby, the tutor of Bacon, and Milton published a treatise upon it. The Count of Murray, regent of Scotland, who had been a pupil of Ramus, popularized it there. In Switzerland it was openly professed at most of the cities by such men as Arminius, Zwinger, and Freigius. It exerted its greatest influence in the German states, where it was aided by university rectors, like Sturm, Fabricius, and Chytræus, and the chair of philosophy at nearly all Protestant institutions came for a time to be held by a Ramist. The Lutherans, however, suspecting that it was an outgrowth of Calvinism, opposed to it the dialectic of Melancthon, and fierce contests arose, which eventually crowded it out. F P. G.

RANDALL, SAMUEL S (1809-1881).—Superintendent of schools; educated at Oxford Academy and at Hamilton College. He taught in the public schools of New York State; was for many years deputy state superintendent of public instruction, and from 1851 to 1870 was superintendent of schools of New York City. His educational publications include *History of the Common School System of the State of New York*, *Principles of Popular Education*, and *Mental and Moral Culture*. He was editor of the *District School Journal* from 1815 to 1852. W S M.

RANDOLPH-MACON COLLEGE, ASHLAND, VA—The oldest college in the country under Methodist auspices. In 1830 a self-perpetuating body of trustees was incorporated and chartered by the General Assembly of Virginia in response to a suggestion of the General Conference of the Methodist Episcopal Church, to establish "a seminary of learning for the instruction of youth." A college for men, named after John Randolph, of Roanoke, and Nathaniel Macon, United States Senator from North Carolina for thirty-seven years, was established at Boydton, and the first class was graduated in 1835. The college was moved to Ashland in 1868. In 1890 the Board of Trustees obtained an amended charter with power to "erect, establish, and maintain . . . schools, academies, or other institutions of learning for the instruction of the youth of the land." As a

RATIO AND PROPORTION

result, the Randolph-Macon System of colleges and academies was established with the following institutions: Randolph-Macon College at Ashland, for men; Academies for boys at Bedford City (1800) and Front Royal (1892); an Institute for girls at Danville (1897), and the Randolph-Macon Woman's College at Lynchburg (*q.v.*), 1893. William W. Smith, A.M., LL.D., is Chancellor. The college at Ashland gives courses leading to the degrees of A.B., B.S., and A.M. The requirements for entrance are fourteen units of high school work. The faculty in 1911-1912 consisted of seventeen members, and the student enrollment was 161.

RANDOLPH-MACON WOMAN'S COLLEGE, LYNCHBURG, VA—An institution for higher education of women founded by subscription of the citizens of Lynchburg and placed under the care of the Randolph-Macon Board of Trustees. (See **RANDOLPH-MACON COLLEGE, ASHLAND, VA.**) The college was opened in 1893 and has rapidly risen to a leading position among women's colleges, being placed in "Division A" in the *Report of the United States Commissioner of Education* (1910). The entrance requirements are fifteen units of high school work. The courses in the college lead to the degree of A.B. and A.M. In 1906 the college was admitted by the Carnegie Foundation to the returning allowance system, but was removed in 1909, since the board of trustees remained denominational under the Virginia Conference of the Methodist Church, South. The faculty in 1911-1912 consisted of forty-six members and the student enrollment was 576.

RATE AID FOR EDUCATION. — See **ENGLAND, EDUCATION IN**.

RATE BILL. — The term given in America during the eighteenth and early half of the nineteenth century to the school fees collected from the pupils. Such "rates" were often established and the amount determined by law. See **FEEs**; **FREE SCHOOL**.

RATIO AND PROPORTION. — Although the idea of ratio is probably prehistoric, since it involves only such a concept as "twice as large," or "half as large," the subject is first met in mathematics in the *sept* of the Egyptians, a certain ratio perhaps corresponding to our tangent of an angle. It is first found as a prominent feature in mathematics in the school of Pythagoras (*q.v.*). Pythagoras was so much interested in the musical notes formed by strings that were altered in a

given ratio that the Greeks occasionally relegated the subject to the domain of music. Eudoxus (*q.v.*), however, treated it as a part of geometry, and probably wrote the fifth book of the "Elements" of Euclid (*q.v.*), wherein the subject is discussed. Nicomachus (*q.v.*), on the other hand, included it in his arithmetic. Among those who made it a part of the theory of music may be mentioned Theon of Smyrna (fl. about 110 A.D.). The fact that in general the Greeks did not conceive of ratios as numbers, but rather as relations, is the reason for such terms as "duplicate ratio," "compound ratios," and the like. The use of the term ratio in the present sense is relatively modern. In Latin the word was commonly employed to mean computation. For the idea which we express by $a:b$ the late Latin writers used the word *proportio*, using *proportionalitas* as we would now use proportion. Thus in speaking of what we would now call ratio and proportion they used the equivalent of proportion and proportionality. So we have in a manuscript of Campanus, a well-known mathematical writer of the thirteenth century, a chapter "De proportionibus et proportionalitate." The title of the great work of Paciucolo (*q.v.*) furnishes another illustration of this usage, containing as it does the words "Proportio et Proportionalitas." This accounts for the expressions that are still heard, "Divide this in the proportion (instead of ratio) of 2 to 3," and "What is the proportionality of these numbers?" While *proportio* and *proportionalitas* were used in these senses, ratio was often used to indicate fractional relations, and numerous ratios had special names. For example, there were multiple ratios ($na:a$), superparticular ratios ($(n+1):n$), the sesquialtera (3:2), and so on. Of such terms we have only the ratio of greater and of less inequality remaining, and even these are found only in a few algebras.

The ancients considered several kinds of proportion, including the following. —

$$\begin{aligned} \text{arithmetic, } b - a &= d - c; \\ \text{geometric, } a:b &= c:d; \\ \text{and harmonic, } \frac{1}{b} - \frac{1}{a} &= \frac{1}{d} - \frac{1}{c}. \end{aligned}$$

These are seen in the following illustration, from the first edition of the arithmetic of Boethius (*q.v.*).

Of these and various others only the geometric proportion has remained. This form has, however, kept several of the ancient names, such as proportion by composition, by division, by alternation, and so on, terms that have lost all of their original significance and that have already been banished from arithmetic, being found only in geometry and occasionally in algebra. These terms will soon disappear, there being no good reason for their retention.

Proportion having grown up as a part of geometry, a somewhat analogous form grew up in the Rule of Three, a rule of business arithmetic. In such an example as the one requiring the cost of five things when the cost of four things is known, there are given three terms from which the fourth is to be found. The Hindus spoke of the rule as the Rule of Three and they gave the fanciful names of

Argument, Fruit, and Requisition to the three given numbers. When the rule found its way into Europe, it brought its Hindu name with it, this being variously translated. For example, the early Italian arithmetics usually had a chapter "De regole del tre"; the early French works had a chapter on "la règle de trois"; the Latin books had one "De regula trium rerum," or on the "Regula de tribus"; and the German writers spoke of "Die Regel de Tri" or the "guldene Regel." These early forms were modernized with their respective languages, and "regula aurea," "clavis mercatorum," and other names were also given to the rule. It was not until the sixteenth century that writers of prominence began to recognize the identity of proportion and the Rule of Three, and not until the nineteenth century was this identity generally conceded by the schools.

Besides the Rule of Three there were analogous rules, such as the Rule of Five, the Rule of Seven, and so on. These all finally ran into Compound Proportion, a subject that has happily nearly disappeared.

Of late it has been recognized by the schools that a proportion is little more than a cumbersome form for an equation, and that, as a subject for arithmetic, at least, it has served its purpose and must be discarded. The proportion

$$x:a = m:n$$

is only another way of writing

$$\frac{x}{a} = \frac{m}{n},$$

$$x = \frac{am}{n}$$

or

$$x = \frac{am}{n}$$

$$x = \frac{am}{n}$$

On this account we may expect to see the simple equation make more progress, and proportion lose its former standing. It seems reasonable to expect that the arithmetics of the near future will contain chapters on the simplest form of the linear equation, but little or no work in proportion. In algebra a similar change is liable to take place, and probably also in geometry. The ratio that we have in similar figures can be treated as a fraction with rational or irrational terms, and the ratio notation (:) will probably come to be merely a symbol of division, as it is in most European countries, changing its significance for somewhat the same reason that the old symbol of proportion (:) has given place to the sign of equality.

Where proportion is now taught it is best treated as an equation, without any such artificial rules as "cause and effect," rules that were devised in the middle of the nineteenth century. Compound proportion is already practically a thing of the past. D. F. S.

RATIO STUDIORUM. — The "Method of Study" of the Jesuit Order (q.v.).

RATIONAL METHOD. — A term used as a trade name for textbooks incorporating a special method of pedagogical procedure said to be based on rational or scientific as opposed to traditional principles of teaching. H. S.

RATIONALISM — In its technical philosophic usage, this term stands for a theory regarding the origin of knowledge opposed to empiricism. It holds that the source and final test of knowledge and truth are not found in experience, which is identified with sense-perceptions or the impressions which things make on the mind, but in certain rational principles, or ultimate concepts. These are variously viewed in different rationalistic systems. Some take them to be innate in the mind; others as pure intuitive principles immediately discerned by the mind, while the Kantians regard them as transcendental categories which are aroused into action by the stimulation of sense, and which then operate to synthesize what would otherwise be a chaotic manifold into orderly objects and connected groups of objects. Kant thought he had reconciled empiricism and rationalism. He conceded to the former that all knowledge originates with and from experience, and that in no case can knowledge transcend the limits of experience, or phenomena in space and time. On the other hand, rational *a priori* principles, certain general functions of logical or conceptual thought, are necessary in order that there may be any such thing as objective experience, so that a rationalistic factor was also introduced. In the nineteenth century, Herbert Spencer attempted a conciliation of empiricism and rationalism on quite a different basis. He held

that space and time, causation and certain moral beliefs, are *a priori* for the individual, but that these rational intuitions can be shown, on grounds of evolutionary science, to be the consolidated accumulated results of racial experience.

In its more popular usage, rationalism stands for reliance upon reason as distinct from faith. This meaning of the term goes back to certain tendencies to rationalize Christian theology found in medieval philosophy; but the special vogue of the conception dates from the controversy between the deistic upholders of natural religion in the eighteenth century and their orthodox opponents who upheld the claims of supernaturally revealed religion, including miracles. In this particular sense of the term rationalism, empiricism itself was rationalistic, at least in its more current forms. On the other hand, there are a few types of empiricism which admit, on grounds of experience, a mystical factor, and such empiricisms are allied with doctrines of faith as an instrumentality of knowledge. Contemporary discussion evinces tendencies to use the term rationalism in a third sense, namely, to denote theories which conceive experience to be purely intellectual or cognitive in character, and which reduce emotions and volitions to combinations of cognitive elements or processes. Intellectualism, as distinct from voluntarism, would seem, however, to be a better term for this meaning. J. D.

RATKE (RATICHIUS), WOLFGANG (1571-1635). — One of the pioneers of modern pedagogy, was born at Wilster, a small town in Holstein, and received his general education at the Johanneum in Hamburg. He then studied theology at the university of Rostock, without, however, attaining any academic degree. From 1600 to 1603 he lived in his home town, engaged in the study of languages, particularly of Hebrew. Owing to his inability to speak in public, he had given up the idea of becoming a minister and turned his attention to a reform of education, especially with regard to the instruction in languages. He went to Holland, and, as a private teacher in Amsterdam (1603-1610), he first made a practical application of his ideas of teaching languages. He put his plans for a reform of education before Prince Maurice of Orange, the Stadholder of the United Netherlands, who was willing to have the new method tried, but only in the instruction of Latin. This did not satisfy Ratke, and he therefore returned to Germany, where, in 1612, he presented his plans to the German princes assembled at the Imperial Diet at Frankfurt. His ideas embraced not only a reform in the teaching of languages, but also the replacing of Latin as the medium of higher education by the vernacular, and the bringing about of unity throughout Germany. He succeeded in inter-

RATKE

estling Duke Ernest of Saxe-Weimar, the Landgrave of Hesse, and other princes, as well as in gaining the approval of the universities of Gießen and Jena. Two professors of Giesen, Helwig and Jungo (*q.v.*), even gave up their positions to devote themselves entirely to the writing of textbooks in accordance with Ratke's ideas. When, in 1614, he was called to Augsburg, both of them followed him to assist in the reformation of that school system. They, as well as other collaborators of Ratke, were bound to secrecy with regard to his methods and had to promise not to publish anything about them without his consent. The Augsburg experiment, followed by others in Colthen (1618-1620) and Magdeburg (1620-1622), failed. These failures were due partly to sectarian controversies, partly also to the personality of Ratke, who lacked tact and organizing ability, but most of all to the novelty and greatness of his plans, which needed time and the training of a new generation of teachers to bring them to fruition.

He remained, however, active in the promulgation of his principles to the end of his life. He had a powerful and steadfast protector in Countess Anna Sophie of Schwarzburg, who took Hebrew lessons from him and interested the great Swedish Chancellor Oxenstierna in his behalf. Ratke was willing to enter into Swedish service, but a stroke of paralysis, in 1633, which deprived him of the use of his tongue and right hand, made this impossible. He died at Erfurt in 1635.

While the direct practical success of Ratke's life work was small, and while it was overshadowed by the greater work of Comenius (*q.v.*), great credit is due to him for first enunciating some of the fundamental principles of modern education. Chief among these are the principles that everything should be done in its natural order or in the course of nature, and that one thing should be mastered at a time. Other ideas of his, important as reformatory influences and as permanent truths, may be enumerated as follows: each thing should be often repeated, everything first in the mother tongue, everything without compulsion, nothing to be learned by rote; mutual conformity in all things (i.e. comparative grammatical study of the languages); first the thing itself, and afterward the explanation of the thing; all things through experience and investigation or experiment. The last of these contains the essentials of the Baconian reforms; the next to the last, the essentials of the Pestalozzian reforms; all of them are foreshadowings of the Comenian reforms. F. M.

RAUHE HAUS, DAS — A juvenile reformatory established at Horn, near Hamburg, in 1833 by J. H. Wichern (*q.v.*) for the vagrant and vicious children of Hamburg. Wichern organized it on the family or "cottage" principle with from twelve to sixteen boys or girls in a family. They were placed in charge of "Brothers" or "Sisters," who were to act as constant companions of the young people. They were given an industrial education. In 1852 there was added a boarding school, now recognized as a *Real School* for unmanageable boys of better families. The system of the Rauhe Haus has been copied elsewhere in Germany, and from the "Brothers" have gone forth many who have taken part in the work of prison reform and other philanthropic rescue work.

RAUMER, KARL GEORG VON (1763-1865) — German mineralogist and historian of education, was born at Wörlitz, near Dessau, in the duchy of Anhalt, and received his education, together with his brother, the famous historian Friedrich von Raumer, at the Joachimsthal gymnasium in Berlin. In 1801 he entered the University of Göttingen to study law, but he also attended lectures on mathematics and biology, and in 1803 he went to the University of Halle, and afterwards to the Mining Academy at Freiberg, where he received much inspiration from the great geologist Werner. Having determined to devote himself to the sciences of mineralogy and geology, he went to Paris (1808-1809) in order to study the magnificent scientific collections which could be found in the Paris museums. Influenced by Fichte's (*q.v.*) *Addresses to the German Nation* and the works of Pestalozzi, Raumer came to the conclusion that the salvation of Germany could be attained only by the education of the people, and that it was his duty to devote himself to this task. He left Paris and went to Yverdon to make a thorough study of Pestalozzi's principles and methods. Dissatisfied with the conditions he found there, he returned after a few months to Germany and published his first work, *Geognostische Fragmente* (1810), which gained

RAUMER, KARL OTTO VON

for him the professorship of mineralogy in the University of Breslau (1811). At the beginning of the War of Liberation he voluntarily entered the army and took part in the battle of Leipzig as the aide of Gneisenau. After the war he returned to Breslau, but his democratic ideas, especially his connection with the "Turners," brought him into conflict with the government, so that he first, in 1819, removed to the University of Halle, and finally in 1823 resigned his professorship. He now became a teacher, and later the principal, of a private school in Nuremberg, where he also founded an institution for delinquent boys. In 1827 he reentered the public service, being appointed professor of mineralogy in the University of Erlangen, Bavaria. In this position he remained until his death. In addition to his regular duties, both at Halle and at Erlangen, he delivered lectures on pedagogy, the outgrowth of which was his *Geschichte der Pädagogik vom Wiederaufblühen klassischer Studien bis auf unsere Zeit (History of Pedagogy from the revival of classical learning down to our time)*. The first and second volumes appeared in 1843, the third in 1847, the fourth in 1855, a recent edition was published in Langensalza in 1897. The work has been made familiar to American readers through translation in Barnard's *American Journal of Education*.

RAUMER, KARL OTTO VON (1805-1859). — Prussian Minister of Education, born at Stargard in Pomerania, attended the gymnasium of Stettin, and studied jurisprudence at the universities of Göttingen and Berlin. He entered the Prussian administrative service, where, in 1845, he rose to the position of *Regierungspräsident*. Being known as a man of the strictest conservative principles, he was called as Minister of Education into the reactionary government formed by Manteuffel in 1850. There it was his chief object to counteract the liberal tendencies of the Prussian schoolmasters, which had become prominent in the revolutionary movements of the year 1848. He issued the famous *Regulative* (school regulations) of 1854, through which the preparation of teachers and the course of study of the elementary schools was restricted to a minimum. In consequence of the opposition aroused by these measures, he resigned in 1859.

F. M.

RAY, JOSEPH (1807-1857) — Author of mathematical textbooks; educated at the Ohio University. He was instructor in secondary schools in Ohio and principal of the Woodward High School at Cincinnati. He was the author of numerous arithmetics, algebras, and other

REACTION EXPERIMENTS

mathematical school books. From 1854 to 1857 he was editor of the *Ohio School Journal*.
W. S. M.

RAYMOND, JOHN HOWARD (1814-1878). — Second president of Vassar College (qv); graduated from Union College in 1832. He studied law and was admitted to the bar, but never practiced. Later he studied theology. He was professor at Madison University (1840-1850) and the University of Rochester (1850-1855). He was president of the Brooklyn Polytechnic Institute (1855-1865) and of Vassar College (1865-1878). He was the author of various papers on educational subjects.

REACTION. — See REACTION EXPERIMENTS.

REACTION EXPERIMENTS — By a reaction is meant the response to an external stimulus by means of a movement. A reaction experiment consists in some type of control of the conditions under which the response is made. Following a broad classification, we may distinguish three uses that have been made of the experiment.

Measurement of Reaction — The problem of measurement has in general taken four forms. (a) The time required to respond to a sensory stimulus by means of a movement has been determined. This, the earliest form of the experiment, was devised by the astronomers in the effort to discover why their records of the transit of a star did not agree from observer to observer. It is characteristic of the period ranging from the dismissal of Kinnebrook by the astronomer royal (Maskelyne), 1700, to about 1850, when Helmholtz discovered a method of measuring the velocity of a nerve current. During this period not only were the differences in the reaction time of different observers recorded, but some attempt was made to find out upon what these differences depend. (See Sanford, Bibliography of "personal equation," *Amer. Jour. of Psychol.*, 1888, II, pp. 424-430.) (b) The velocity of the nerve current has been estimated. The method, introduced by Helmholtz and improved by himself and others, consists in exercising a muscle with a long stretch of nerve attached, and connecting the muscle with a lever, so that its contractions are registered upon a quickly moving surface. By electrical stimulation of the nerve at points near to and far from the muscle, two curves are obtained, the latter of which is found to begin a trifle later than the former. A tuning fork, writing its vibrations beneath these records, shows how much later the second contraction began than the first. The rate, for both motor and sensory nerves in man, is commonly estimated at about 30 m. per second. Dolley and Cattell (1894), however,

think it is much greater (c) The time required for a sense organ to respond to its stimulus, or the "inertia of the sense organ," has been measured. Attempts have been made in vision to determine this interval for both colored and colorless light by Exner, Düncke, Kunkel, Düri, and others. Work which might be considered as falling under the same head has been done in audition, for both tone and noise, and in pressure. Time of movement is excluded from these results, and the methods are so arranged as to limit the interval, as closely as possible, to the time elapsing from beginning of excitation to maximum of sensation (d) The time required for the exercise of simple mental functions has been estimated. The determination is based upon the principle that, if the time of simple reaction for a given observer is known, a rough estimate of the time required for the exercise of simple mental functions may be obtained by taking the reaction time when these functions are superadded, and comparing the result with the simple reaction time. Distinction and choice, limited and unlimited association, and comparison, are examples of the simple mental functions that have been studied. Reactions involving distinction and choice were first used by Donders and his pupils, 1865-1867. White and red lights were used as stimuli, and the observer was required to react to the one light with the right and to the other with the left hand. In later experiments attempts have been made to get separate time-values for distinction and choice. This is done by comparing the results of experiments of the Donders type with the results of experiments involving a distinction between a series of stimuli but no choice as to the type of reacting movement. An example of limited association is found in the simple question and answer. Here nothing but simple remembering is involved, and the association is limited by the nature of the question. The unlimited association has been more frequently investigated than the limited. The observer is given a word, and is required to report the first word that comes into his mind in association with it. In both of these cases of association, the "pure association time" is reckoned as the total time minus the sum of the simple reaction time and the time required to report the word. The reactions involving comparison have usually taken the form of question and answer, the answer requiring some comparison of a greater or less degree of complexity. It is obvious from the foregoing that the variations that can be given to this form of the reaction experiment are very numerous. Work has continued from the experiments of Donders to the present time. It seems to have reached its culmination, however, in the late seventies and the early eighties of the last century.

The Factors that Influence Reaction Time.

—Space will be taken here only for the briefest

account of the factors that influence the simple reaction. For the factors that influence the reaction complicated by the addition of one or more mental functions, see J. Jastrow, *The Time Relations of Mental Phenomena*, 1890, and K. Fricke, *Biol. Centralbl.*, 1889, Vol. VIII, 673; 1889, Vol. IX, pp. 234, 437, 407. (a) *The kind of stimulus and the sense organ stimulated.* Since the time required for the different sense organs to respond to stimulation varies, we should expect a corresponding variation in the reaction time. Jastrow averages the results reported by a large number of experimenters, and finds the time for hearing, 138σ; for pressure, 148σ, and for vision, 185σ. Vintschgu and Steinhach report the time for pressure on various parts of the head, 109σ; for cold, 135σ; and for warmth, 146σ. Similar values for various points on the hand are 121σ, 138σ, and 209σ. Goldscheider made the difference in time for warmth and cold still greater. Moldenhauer finds the reaction time to smell to average about 300σ. Hönigshmiel finds for taste on the tip of the tongue values ranging, for different observers, from 182σ to 300σ. On the back of the tongue the time is longer. It is longest for bitter, shortest for salt, and about equal for sweet and sour. Exner reacts to electric stimulation on the back of the hand in 132σ, on the forehead in 137σ, and on the foot in 175σ. Wittlich reacts to stimulus on the back of the finger in less time than on the front. Hall and von Kries find a longer reaction time for the peripheral than for the central retina. High tones are reacted to more quickly than low tones. (b) *Intensity of the stimulus.* Exner and Kunkel have found that the time required for a sense organ to respond to its stimulation decreases with increase in intensity of the stimulus. Correspondingly, the reaction time has been found to decrease with increase in the intensity of the stimulus. Wundt obtained this result in the case of sound stimuli, Exner, in that of light stimuli; and Beiger and Cattell for light, electrical-cutaneous, and sound stimuli. In reactions to the liminal intensity of various sense stimuli, Wundt obtained an approximately constant result. (c) *Mode of reaction.* The time varies with the type of reacting movement. Münsterberg, reacting with four fingers, found that at first the thumb and little finger responded less quickly than the others; practice, however, reduced the difference to a minimum. Féré reports that the fingers executing the strongest movements give the shortest reaction times. Vintschgu and Cattell show that reactions by the fingers are quicker than by the voice. Results have been obtained, also, which seem to show that movements made by the right side of the body are quicker than those by the left. These results, however, cannot be considered uniform. Smith, and Judd and McAllister have proved that the reacting movement is not simple,

Sometimes an antagonistic movement, sometimes a partial reaction, sudden or gradual, precedes the true reaction. (d) *Age of the observer.* Binet has shown that children from three and one half to seven years react more slowly than adults. The very old also react more slowly than those in the prime of life. (e) *The mental and physical condition of the observer.* Obsteinier, Vintschgau, Goldscheider, and others find that mental and physical fatigue, worry, or slight indisposition, causes an increase of thirty to forty σ in reaction time. Fatigue induced by the experiment itself is also of effect. With a simple natural reaction Cattell has shown, however, that fatigue is very slow to appear. The effect comes, apparently, as a difficulty in concentrating upon the experiment. The time of reaction is lengthened, but the influence is manifested chiefly as an increase in the mean variation of the results. (f) *Practice.* The effect depends to a considerable degree upon the mode of reaction. The influence is strongest at first, and decreases as the mode of reaction is learned. Cattell finds that, when the movement is once thoroughly learned, a rest of three months does not affect reaction time. Trautscholdt, however, asserts that a slight increase in reaction time marks the beginning of each day's work. Wundt lays stress upon the necessity of maximal practice for the determination of representative values and their variability. Alechiewf finds a great reduction as a result of practice in the simple reactions, sensory and motor, to light; and Beigmann, in those to sound. (g) *Voluntary direction of attention.* When attention is directed to the sense impression, the reaction time is found to be longer than when it is directed to the movement. The first type of reaction is called the "sensory" reaction, the second the "motor" reaction. Lange showed that the time required for the sensory reaction to an auditory impression averages 227 σ , motor 123 σ ; to a visual impression, sensory 290 σ , motor 113 σ , to a tactile impression, sensory 213 σ , motor 108 σ . This difference, however, is believed to be extreme by Munsterberg, Martius, and Dwelshauvers. The motor type of reaction has the smaller mean variation. Differences in result are no doubt due, in part, to the difficulty in maintaining the constancy of the type of reaction, there seems to be a tendency, varying with individual reactors, for the sensory to pass over into the motor type. The individual differences found since the days of Bessel may also be due, in part, to a natural tendency to direct the attention in the one way or the other. (h) *The action of drugs and the influence of mental and nervous disorders.* Exner found that wine decreases the reaction time; Vintschgau and Dietl, that coffee decreases and morphium increases the reaction time. Kirschlin and Orhansky affirm that alcohol

decreases the reaction time for a short period, and then increases it for a long period. A change in the reaction time of the insane has frequently been observed, melancholia probably lengthens, mania shortens, the reaction time. In general paralysis, Obsteinier finds a rapid increase from incipient to advanced stages of the disease. Hall has found a marked decrease in hypnosis, but this result has not been corroborated by others.

Applications.—The experiment has been used for the study of the action of consciousness under laboratory conditions. This application of the experiment was suggested by Kulpe, and has been indorsed by Wundt, Titchener, and others. The experiment may take many forms: the conscious antecedents and concomitants of movement may be studied under a wide range of conditions; correlations may be made between the force, rapidity, extent, etc., of movement and its conscious antecedents and concomitants, the mean variation and the time of movement may be studied in relation to variations in the antecedent of the movement; and so on.

The reaction experiment has also served miscellaneous purposes. For example, Cattell has used it as a means of estimating the differences between the intensity of sensations; Munsterberg and Bush, for determining the just noticeable difference of intensity; and Henmon, for testing color sensitivity. It has besides been applied in tests of school children, in tests of efficiency, and in tests of criminals, the mentally deranged, and the lower animals. At the present time, two specific applications are in the forefront of discussion. The association reaction, and derivatives from it, have been employed by Kulpe and the Würzburg school for the analysis of the processes of thought, and have led to the discovery of an alleged "thought element" of consciousness. In a very different way, the same association reaction is turned to account by Jung and the Zürich school for the discovery of emotive "complexes" in the minds of their reactors, an unusually long reaction time to a suggestive word is taken as the symptom of an emotive disturbance which may, e.g., betray complicity in a crime. C. E. T. and E. B. T.

REACTION TIME.—See REACTION EXPERIMENTS.

READING.—See LITERATURE, CHILDREN'S, LITERATURE, ENGLISH; also COMPOSITION; NURSERY RHYMES, etc.

READING, CHILDREN'S

READING, CHILDREN'S. — See LITERATURE, CHILDREN'S

READING CIRCLES. — As found in the United States these are of three kinds: (1) those of the Chautauqua type, open usually to any adult; (2) those intended primarily for public school teachers, and (3) those intended primarily for public school pupils. The first form has been fully treated elsewhere (See CHAUTAUQUA MOVEMENT.)

Teachers' Reading Circles. — The teachers' reading circle idea is an adaptation of the Chautauqua idea to the needs of public school teachers. In 1878 the Chautauqua Society first provided courses for public school teachers, and that same year the Chautauqua Literary and Scientific Circle was organized. In 1882 a paper, read before the Ohio State Teachers' Association, suggested the application of the Chautauqua idea to the improvement of teachers in service, and by the teachers themselves, and in 1883 the first Teachers' Reading Circle was organized, in Ohio. The Indiana State Teachers' Association provided for the organization of a similar circle in 1883, and the movement has since spread almost all over the United States. Thirty-seven states now have such organizations, nearly one half of which have been organized since 1900. In most of the states the State Teachers' Association has been the active agent in organizing and perfecting the reading circles, though in a few states the reading circle has been adopted by the state and is under the control of the state educational authorities. In twenty-seven states the work done in the reading circles counts as a part of the work for a teachers' certificate. In a number of the circles, courses of reading and study covering two or three years are laid out, and diplomas are granted by the circles to those who complete them. Three or four books are usually adopted for reading and study each year, helpful outlines are issued, and frequently the work done is discussed at the township or county institutes. For many years the books adopted were largely historical, literary, or cultural in type, but within recent years there has been a marked tendency to adopt books of a higher professional grade. The different circles have rendered an important service, particularly to the untrained rural teacher, and with the changing character of the work in recent years they will doubtless continue to render much valuable service. (See TEACHERS, TRAINING OF, INSTITUTES.)

Pupils' Reading Circles. — These are a later development of the teachers' reading circle idea. Most of the states having teachers' reading circles have also developed similar reading circles for the pupils in the elementary schools. These are usually under the same management and control as the

READING, HYGIENE OF

circles for teachers. The books selected for the pupils are divided into a number of grades, suited to the needs of pupils of different ages, and usually beginning with the pupils in the third or fourth grade. The books are on sale to any pupils desiring to have their own copies, and a sufficient number of sets is purchased to supply each schoolroom with one or more of the books. The pupils are then induced, by various means, to read these books each year. To establish early the habit of reading good books is regarded as one of the most important aims of the work, and the results in general have been very good. This branch of the work is also likely to be expanded more in the future.

READING, HYGIENE OF. — The special hygienic aspects of reading may be stated very briefly. Four things are to be especially considered: (1) reading in relation to the voice; (2) reading in relation to the eye; (3) reading in relation to posture, (4) reading in relation to the mental habits formed.

(1) *Reading in Relation to the Voice.* — Oral reading from the hygienic point of view may be looked upon as a special form of gymnastics, and all the well accepted rules in regard to the exercise of any physical organ — adaptation to the physiological stage of development, care for regular exercise, and care to avoid overstrain — are to be considered. More concretely the rules are much the same as for the hygiene of the voice in general, and special care should be taken for proper breathing, to avoid speaking too loud, stammering, stuttering, and the like. Such neuroses seem liable to be caused by premature exercise in the more complex vocal acquisitions. Dr. Hartwell found a great increase in the number of cases of stutters during the first years of the school work, when the early lessons in reading are being given. Such defects are often due apparently to improper methods of instruction.

(2) *Reading in Relation to the Eye.* — The activity of the eye in reading has been considered above, but it is important that special care should be taken to avoid all injurious conditions. The well accepted rules for the hygiene of the eye should be observed, and, as regards reading, especially the following rules.
 (a) A proper posture, with head erect, should be insisted upon; and suitable seats and desks

READING, HYGIENE OF

are necessary. (b) The book should be held at a distance of at least twelve inches from the eyes. (c) The instruction should be so divided that the eyes are used continuously but a short time for neat work. In the first years of school life the time should not be longer than fifteen minutes, in the adolescent years not more than half an hour. (d) There should be frequent change of tension by looking at distant objects. (See EYE.)

The norms as regards textbooks have been summarized by the Committee of the American School Hygiene Association as follows:—

(a) The paper should be unglazed, free from shine, and opaque.

(b) The eye moves by a succession of movements and stops, and a long backward sweep to the beginning of the next line.

Fatigue is markedly increased by the difficulty of the backward movement and of locating the beginning of the next line if the line is too long. The maximum of safety is 90 mm., and 60 mm. to 80 mm. is better.

(c) The margin should be sufficient so that the eye, in the backward movement, does not swing off the paper; and the inner margin should be wide enough so that the inner end of the line is not obscured by the curvature of the paper.

(d) The size of the type should be as follows:—
1. Adult's standard.—(i) The height of the small letters should be 1.5 mm. (ii) The width of the vertical stroke should be .25 mm. (iii) The space within the letters should be .5 mm. (iv) The space between the letters should be .50 to .75 mm. (v) The space between the words should be .2 mm. (vi) The leading should be .25 mm.

2. The standards for children are as follows:—
A. First Grade.—(i) The height of the small letters should be at least 2.0 mm., with the other dimensions in proportion. (ii) The width of the vertical stroke should be from .4 mm. to .5 mm. (iii) The space within the letters should be from .4 mm. to .5 mm. (iv) The space between the letters should be about 1 mm. (v) The space between the words should be about .3 mm. (vi) The leading should be from .4 mm. to .5 mm.

B. For the second and third years the standard may be reduced slightly, but the letters should not be less than 2 mm. in height, and the leading should be .4 mm.
C. For the fourth year height and leading should not be less than 1.6 mm. and .5 mm., respectively. It would be better to retain the standard of the fourth year through the sixth year.

(3) *Reading in Relation to Posture*—A proper posture with head erect is necessary to make reading hygienic, and suitable seats and desks are necessary. The same general rules apply as for posture in other subjects of instruction, but it is desirable that habits of correct posture be developed during the years of school life so that an hygienic posture may be used in home work as well as in the school. (See DESKS; WRITING.)

(4) *Reading in Relation to the Mental Habits Formed*—As reading is supposed to be an essential accomplishment for culture and so large a part of school work is based upon reading, the mental habits formed in this scholastic occupation are of great importance. Habits of attention, of orderly association, of attention to the essential and of ignoring the unessential details, habits of suitable alternation of work and rest, are all significant. Reading be-

READING, PSYCHOLOGY OF

comes, in much of our life to-day and in case of many of our school children, distinctly a vice, and it is at least likely to be injurious if the reading habit is formed at too early an age. Mosso, President Hall, Professor Patrick, and others, maintain that a child should not learn to read before the age of eight; and while perhaps no harm will come from acquiring this accomplishment at an earlier age, the reading habit at least should be postponed until later. Not only should the child at this early age be engaged in spontaneous motor activities, play, simple forms of manual exercises, and the like, but on the other hand his organism is not adapted for the work of reading, especially as his eyes are likely to be undeveloped, his arms too short to hold the book at the proper distance from the eyes, and his respiration, circulation, and digestion likely to be interfered with by prolonged sedentary occupations, and the psychophysiologic mechanism in general is not fitted for such work. W. H. B.

READING, PSYCHOLOGY OF—In the widest sense of the word the interpretation of any optical or tactual symbols may be called reading. It began with the crude symbolic drawings of prehistoric man. In its narrower sense reading refers to the perception and interpretation of written or printed words. In this sense reading is both an end and a means in our common school education. It is an end in so far as the child must be taught to read. It is a means in so far as books are used as sources of information. The two aspects are not independent. Information may be given in the primers, while final efficiency in the assimilation of printed matter should be the criterion of satisfactory training.

The pedagogical and practical importance of reading combine with its purely scientific aspects to make the recent development of the psychology of reading unusually suggestive.

It is the more important carefully to distinguish between experimentally determined scientific facts and the easy generalizations which are so often developed under the influence of special needs and interests. Psychology of reading does not determine the best method of teaching reading, the proper time to begin, or the best sequence of reading matter. Its real aim, as yet only partially fulfilled, is to describe the facts. The scientific pedagogy of reading, on the other hand, is a normative science beginning where psychology leaves off. It is a separate body of knowledge with its own aims, methods, and results.

Obviously, all reading must involve three more or less distinct steps: (1) ocular adjustments to see the words; (2) the apprehension of the words as visual objects, and (3) the comprehension of their meaning. Reading aloud involves two additional processes. (4) the coordinated activity of the organs of speech, and (5) the perception of the resulting sounds. Scientific analysis goes farther. It seeks to describe these various processes in detail, to discover their causal interrelationships, and the part each plays in the total linguistic process.

Eye Movements and the Reading Pauses — The eyes of a reader do not move evenly along the lines of print, but rather in a succession of jerks which are separated by full stops. The stops are moments of fixation and of clear vision. They are the essential reading pauses. The jerks are rapid eye movements. Their only function is to bring an appropriate part of the line or page to a retinal area of clear vision. Each line is thus read by sections. But each section is always seen in its peripheral setting. There is no sharp division line between the clear and the obscure.

Sometimes the peripheral vision of words, when they are indistinctly seen in the hazy part of a line, is sufficient for reading. It is always useful, furnishing an important premonition of coming words and phrases, as well as a consciousness of the relation of the immediately fixated symbols to the larger groups of phrase and sentence. Without this premonition of coming words and the outlines of larger groups, the process of reading would be slow and difficult.

The number of reading pauses in any line is determined primarily by the size of the sections that must be clearly seen. In rapid reading of familiar or easy text, the eye movements fall into a kind of habitual rhythm, making the number of reading pauses approximately constant from line to line. The extent of the reading sections varies according to a large variety of conditions, only some of which are understood. Unfamiliar and difficult matter, poor print, and attention to textual details, all have been shown to increase the number of pauses. Careful proofreading seems to de-

mand a pause for every three or four letters. In inverse ratio to their development, children average more pauses than adults. In general, rapid readers average fewer pauses to the line than slow readers, their eye movements are more rhythmic, and the duration of the fixation pauses is shorter.

The "fixation point" usually remains well within the printed area. It neither goes to the end of a line nor starts at the beginning. Regular movement of the eyes along each line from left to right and back again to the next line is an acquired habit and has to be learned. It is disturbed by gross variation in the length of lines. Long lines complicate the adjustments with adaptations for distance. They make it difficult both to keep the place and to find the next line. The exact location of the fixation point within any given reading section seems to be a matter of relative indifference. In ordinary reading we do not look at a point or even at a single letter. Photographic records and after-image experiments both indicate that the fixation point may fall anywhere within words or even between them. The statement that it regularly travels along the tops of the letters is false. In successive fixations of the same phrase or word it never falls twice on the same spot, except by accident. Short words without especially striking form or habitual grouping encourage numerous fixations. Familiar and frequently repeated phrases, on the other hand, may be read entire from a single fixation. In binocular reading the eye movements are regularly complicated by variations of convergence. Their only importance for the reading process is the consequent fatigue.

The Visual Apprehension of Words. — The facts of eye movement indicate that we do not ordinarily read by a successive apprehension of the individual letters, however rapid or abbreviated. This has abundant experimental proof. Successive apprehension of the individual letters may occur, but it disturbs the ordinary reading process. Reading from a succession of letters is a slow and difficult process, depending on a mental reconstruction of the word forms in which they belong. This may be roughly demonstrated by moving a piece of cardboard, in which one has cut a small vertical slit, across a line of print. If the slit shows only one letter at a time, reading will be many times slower than normal, and relatively inaccurate.

The entire visual field which is given at any fixation pause really constitutes a simultaneous visual whole. Both in ordinary experience and in reading, we analyze this simultaneously given visual field into smaller units only so far as our practical needs dictate. In reading, our real interests are meanings, and they attach themselves to words and phrases, not to the individual letters. In case of special interests, like proofreading, we may analyze a word or

even a letter, but that is not the way we read. The only succession of visual facts is the succession of different parts of the visual whole in the field of clear vision. Even the child, painfully spelling out a word letter by letter, sees each letter in its word setting. Without the visual word form, the continuous after effects of the past letters, and the premonition of the new ones, his succession of letters would never be a word. In adult reading the analysis of the visual field is less detailed. The area of effective premonition is larger.

The area which can be seen clearly during any one fixation may be measured. If one holds his eyes relatively still, only about five letters of print will be unequivocally clear at one time. Not more than three are sharply defined. If a group of letters is suddenly exposed with a shutter for .1", from four to six letters only can be apprehended from one exposure. For regularly grasping six letters one needs special practice and favorable conditions. Under these same experimental conditions, words of twenty odd letters may be read with comparative ease. It is even possible to read still more letters in familiar phrases and significant word combinations.

A peculiarity of these experiments is the persistent illusion, when words and phrases are read, that they are seen clearly throughout. This would be physiologically impossible. The illusion indicates, what is otherwise thoroughly demonstrated, that central factors combine with the objective stimuli in the apprehension of familiar words and letter groups.

Every group of letters has a more or less characteristic group form. It varies with the letters that compose the group, but letters in groups develop at least two new characteristics. Optically speaking, the form of bounded spaces is a function of the combination of their boundary lines, while masses may affect us when their composite parts remain unnoticed. The configuration of the white background and the massing of black both vary with every change of letter combination. The plateaus, hills, valleys, and gorges of black are often quite characteristic, and familiar words can be read from these characteristics when the individual letters are too indistinct to be made out.

The relative participation of the word form and the individual letters in the recognition of words is one of the most contested points in the psychology of reading. Unfortunately, it has important pedagogical bearings.

The psychological truth that we regularly read in word wholes and phrase wholes has been freely exploited in recent pedagogy. The cooperation of the area of clear vision has been generally ignored. In tachistoscopic experiments with adequate exposure there is no evidence that either the total word form or the cleared area predominates in the visual perception. Possibly their relative importance

varies; some of the errors seem to indicate it. Certainly that part of the visual field to which one directly attends may vary. It may correspond with the area of clear vision, or it may be peripheral. It may be a point, or it may be an entire page. It is possible that there are perceptual types. In normal reading, however, there is abundant evidence that the word forms, indistinctly seen in peripheral vision, begin the reading process well in advance of direct fixation and the consequent clearing up of the letters.

It is this premonition of coming words and phrases, sentence breaks, and paragraphs, that determines the position of future fixations, and reduces the duration of individual fixations sometimes to pauses one quarter the normal perception time. They are often less than the simple reaction time of the eye.

In addition to visual premonitions, meaning premonitions regularly contribute to the apprehension of the fixated word. This is obvious in familiar paragraphs where the fixation pauses are consequently few. But one can stop anywhere in a sentence of new matter and make a good guess at the next word. Sometimes we substitute synonymous words in reading aloud, without knowing it. Or, having a false premonition of the sense, we may misread. Adequate premonitions are as conspicuously lacking in the stumbling reading of childhood as in our reading of a foreign language. Their development is a most important part of the training in rapid reading. The very rapid reader who makes two or three steps in a line can see no more distinctly than the plodder with ten. His main advantage is in the way he grasps what he sees only indistinctly in the extra-fixational vision.

In adult reading the moment of actual fixation seems to be an incident somewhere in the middle of the reading process. Coming between the premonition and the after-echo, its effect is to correct, to confirm, and to intensify the premonition. Psychologically its function is selective and definitive. It emphasizes the excitation of suitable residues and inhibits the misfits. The pedagogical importance of the word forms is clear. It is possible that special training in peripheral vision would be worth while. But it is equally evident that no training is adequate which does not provide for the corrective cooperation of direct fixation.

Comprehension of the meaning is the immediate goal of all reading. But comprehension is a special process. It follows from the other reading processes only when its especial conditions are fulfilled.

The relation between thought and words is only incidentally a problem of reading. It belongs to the general psychology of language. Words are parts of our total experience that come to stand for the rest. We understand words when the experience of which they

formed a part is revived in consciousness. For the adult this revival is usually fleeting and partial, without distinct mental imagery. In early childhood meanings are apt to be specific experiences which are revived with vivid mental imagery. This typical difference is important in the selection of reading matter. The child's needs are concrete.

The acquisition of new information from reading depends on the experiences already connected with the words, and the processes of analogy by which new imaginary experiences are constructed out of the materials of the past. Unfortunately, the symbolic value of the printed word is relatively poor. It lacks tone, accent, emphasis, and gesture. Pictures may help, but ultimately the child must learn to make his mental construction without them. The child's play of vivid imagery tends to outrun the plodding apprehension of the words. Handicapped by inadequate experience and without adequate premonition of what is coming in the text, the accurate comprehension of meaning is for the child a complex and often a tedious process of mental readjustments.

Articulation.—In the development of language, graphic symbols for words are a relatively late acquisition. A large part of humanity does not possess them at all. They are regularly learned by children after the fundamental associations between vocal utterance and ideas are well established. Words are thus associated with meanings largely through their motor-acoustic aspects. Our written and printed words are well adapted for this relationship, since they represent not only words as a whole but the individual sounds in the order of their vocalization. This symbolization is not exact and probably never can be. In view of the movement to minimize its inadequacies, it is well to remember that familiar word forms are more serviceable in rapid reading than accurate symbolization of the sequence of sounds. The latter is important chiefly during the learning process. It is not impossible that the future development of printing may be towards the greater individualization of words even at the cost of phonetic abbreviation.

The indirect association of words with their meanings through their motor-acoustic residue is persistent and almost universal. Clinical observations of aphasia indicate that it has a definite anatomical basis. It may be necessary. Certainly its effect on the reading process is far-reaching. It seems to be impossible for most adults to read without saying the words to themselves. Some persons regularly move the speech organs or mumble the words. In the child, vocalization insures the adequate apprehension of each word. In rapid reading the motor-acoustic images are more or less abbreviated. It is one of the problems of the pedagogy of reading to determine how far this abbreviation may go. Cer-

tainly adequate training demands the suppression of actual movements.

The relation between the simultaneous wholes of vision and the successive wholes of articulation is the probable basis of the illusion of successive visual apprehension of a word. In reading aloud the eyes regularly keep somewhat ahead of the actual speech. In rapid silent reading direct fixation and the motor-acoustic images are more nearly simultaneous. Apparently the visual premonitions start the motor-acoustic processes. Comprehension reaches well ahead and back into the past uniting all the fragments into a consistent whole.

In view of the complexity of the adjustments and coordinations that are involved in reading, their dependence on individual experience, and their probable typical variations, it is evident why the teaching of reading has not evolved into a simple mechanical process.

Methodological simplicity must miss something of the real complications. The total process is neither all analysis nor all synthesis. Every moment of reading involves both in ever changing combinations.

Two main problems confront the pedagogy of reading: (1) the problem of developing the necessary interrelated habits in different individuals, in the least time, with the least useless fiction, and the most residual benefit; (2) the problem of raising the general level of reading efficiency.

READING SCHOOLS.—See ABCDARIANS, DAME SCHOOLS; COLONIAL PERIOD IN AMERICAN EDUCATION, WRITING SCHOOLS.

READING, TEACHING BEGINNERS.—The purpose of teaching children to read is to give them the power to acquire thought from the printed or written page. In actual school practice the dominant aim may go beyond thought getting to expression, when oral rendition becomes the chief purpose of instruction. This is often the case in the intermediate and grammar grades. It may fall short of thoughtful reading in the primary grades, where the mechanics of pronunciation and spelling obtrude themselves as a difficulty from the very beginning, and gain disproportionate attention from both teacher and child at every step. Ready silent reading which gives the pupil mastery of meaning should be made the primary end; oral reading, whether for mastery of the mechanics of pronunciation or for fostering skill in expression, is a secondary

consideration. The phonetic interpretation of printed words is merely an accessory in getting thought, and no technical training in vocal intonation can be successful unless the meaning to be expressed is thoroughly grasped. That these relations between fundamental aims and necessary skills have not been maintained in actual schoolroom procedure is apparent to the most casual student of contemporary teaching. The fixed traditions of the profession have been against such a view. The most active battle ground in the reform of school teaching is found in the primary grades, particularly in the first school year where beginners are taught to read. The mistakes committed there have persisted through the grades, and the reconstructions successfully established there have quickly influenced higher teaching. A discussion of the problem of teaching beginners to read is, therefore, crucial.

Effective reading depends upon the association of three factors. (1) The meaning which

Fig. 1.

the word or words symbolize, (2) the visual form of the word, and (3) the pronunciation of it (See Fig. 1). M = meaning; V = visual or printed form of word, O = oral form or pronunciation.

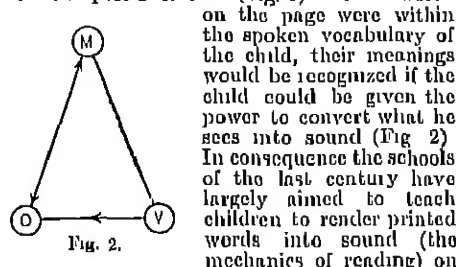

Fig. 2.

The child who enters school for the first time is not ignorant of all these factors. He has had a considerable number of experiences (M) with which he has already associated the appropriate words, phrases, and sentences of speech (O). He lacks only a knowledge of the third factor, the printed forms (V), which are to be associated with experience and speech. In consequence the school's first effort has been to supply the missing association between the printed form and the pronunciation (Fig. 1). If the words on the page were within the spoken vocabulary of the child, their meanings would be recognized if the child could be given the power to convert what he sees into sound (Fig. 2). In consequence the schools of the last century have largely aimed to teach children to render printed words into sound (the mechanics of reading) on the faith that an already existing association between pronunciation and meaning would complete the pathway to meaning. In the natural course of events, it was assumed, the association would become a direct one between print and meaning (Fig. 3). The effort to solve the problem by this approach through sound

has led to the development of a long series of so-called *phonic methods*.

The earliest of these phonic methods was the *alphabetic method*. The children learned the alphabet so they could readily identify any letter by its name. Then the child would, in a very rough way, convert the familiar word (cat) into its alphabetic name units, obtaining a very rough suggestion of the sound of the word (see-ay-tee). Such reading by spelling was further assisted by syllabic drills (ay-bee ab; bee-ay ba; etc.)

Fig. 3.

The crudity of such alphabetic spelling was apparent, and a more refined method of phonic spelling soon came into vogue. In this method the letters of a word are spelled by their elementary sounds, not by their alphabetic names. Then the elementary sounds associated with the letters are blended into a pronunciation of the word. But silent letters, single letters with more than one sound, and several letters grouped to represent a single sound interfered with the efficiency of the *phonic method*. By a very careful selection of words such difficulties could be avoided, but not for long. In consequence this simple phonic method gave way to more complicated *phonetic methods*. An attempt was made to give each sound its own characteristic symbol. This was done in two ways: (1) Additional characters were contrived so that forty-four or more characters are used instead of twenty-six (e.g. the characters for the various sounds were kept similar in general appearance, but differentiated in detail for each sound value). Silent letters were printed in hair lines. (2) The usual twenty-six letter characters were preserved and the differentiations were made by placing a diacritical mark above or below the regular symbol. The second method does not attempt to reconstruct printing so much as to provide a more accurate identification during the learning period. Psychologically, however, the *diacritical method* provides as many phonetic characters as the *extended alphabet method*. In either case the child has finally to learn to pronounce words without these special and artificial aids, which involve two forms for a single pronunciation, and increase the child's task of memorization.

A reaction against reading words as they are not presented in books was inevitable. Here and there the reformers, still believing in a phonic method, attempted to teach children to read in a less artificial way. Some went back to the syllable as a basis, thus increasing the unit of attack and avoiding some of the difficulties of alphabetic and phonetic spelling of words. But the syllable is an in-

flexible unit which does not with sufficient frequency correspond to the child's natural way of analyzing or building words (number *versus* n-un-b-er; nudge *versus* n-udge, etc.). The search for a larger, more flexible, and less artificial method culminated in the use of the phonogram or natural sound unit: (l-ight, g-ood; m-an-li-ness), and the *phonogrammic method* quickly supplanted the *syllabic method*.

Many advantages are claimed for the phonogrammic method. (1) It separates words purely on the basis of their sound division, avoiding the units of the syllabic method which are determined by philological derivation or conventional practice. (2) It is more flexible, as it can take into account the maturity and individuality of children (h-um-ble-n-ess, humble-ness, etc.). (3) It tends on the whole to induce the child to see the word elements in the largest possible units of identification, making sound approximation more accurate and sound blending more easy. (4) It treats irregular words (the chief bugbear of phonetic methods) as a phonogrammic unit or sight word (through). Though not inherent in the method itself, teachers who use the phonogrammic method find it less necessary to depend on diacritic marks, accents, printed word divisions, and all other artificial devices that give words a different appearance from that which they have in normal use.

It is to be noted that the evolution of phonic methods shows several important tendencies which in themselves are indicative of the fallacies which underlie the work of those who have stressed the method of word-sound translation as the chief means of teaching reading to beginners. They are as follows: (1) These methods are chiefly synthetic at the start, but tend to become an analytic-synthetic method. First, the child is given the alphabet and its names, and then builds the word sound from the units. Later with the phonogram he breaks the word up into familiar sight units that are natural to him and then blends them into a pronunciation of the word. (2) The unit for handling sounds grows larger: letter, syllable, phonogram, sight word. (3) There is a decreasing artificiality in the teaching devices employed, note the abolition of diacritics, marks, etc. (4) The use of larger units and more natural methods frees the child's attention from mere phonetic translation and permits it to focus in larger degree on the meanings he is trying to obtain from his reading.

But there is a fundamental fallacy underlying the premise which has led to this large dependence on phonic methods in teaching beginners to read. It has been assumed that children would gain meanings from their reading if they could translate the printed words into correct pronunciations (Figs 2, 3). This seems a reasonable assumption when the words used in reading are within the experience and oral vocabulary of children. But even when

this is the case, children, so much engrossed with the mere mechanical translation of symbols into sounds, hardly let their normal associations enter into their thought; they become mere pronouncers, the "parrot-readers" known to every school system. But the reading material more and more tends to be outside the vocabulary and experience of first-grade children, for three reasons: (1) Our American school population is less homogeneous than it once was. The experiences and consequently the vocabularies of young children vary greatly with economic and cultural station and geographical location. The modern primer is not effective in giving a vocabulary common to urban and rural pupils, the children of the rich and the poor. (2) The problem is still further complicated by the large number of school children who are foreign born or American born of foreign parents. These do not have a command of oral English, and getting the sound of words does not lead to their meanings. The large number of foreign children who have recently entered our country and our schools has been the largest single factor in revealing the futility of methods of teaching reading in the American receiving classes. (3) Finally, that pedagogical movement which has fostered the reading of children's classics in the lower grades, instead of presenting matter thoroughly familiar to the child, has introduced a host of new words outside their life and speech. Under these conditions the traditional phonic methods, in spite of their improvement, have become less and less adequate; and other methods designed to focus attention on the direct connection between printed word and meaning have grown in favor.

These so-called *thought methods* have always been used. In a sense they are our oldest methods. But in conscious pedagogical theory they are more recent than the phonic methods already discussed. There are three types of thought methods: (1) the *sentence method*, (2) the *phrase method*, and (3) the *word method*. The *sentence method* assumes that the sentence-whole is the real unit of thought, speech, and pronunciation. Often the sentences are the product of the child's own experience and speech, and are written down on the blackboard as they are spoken in description of a picture, object, or action, or in narration of a story. The child reads these sentences naturally, as they express a reality. Sentences with similar beginnings and different endings (or vice versa) are placed in a row and read. Specific phrases or words thus come to be associated with their own form, their particular pronunciation, and their meaning. Words are similarly treated in the derivation of word parts. The *phrase method* is less often mentioned, as the thought method of teaching reading has been discussed chiefly in terms of the sentence and the word method. It has been a stage in

supplementation of the sentence method when identification of parts of sentences or words was desired before proceeding to phonic analysis. It has been necessary as a supplement to the word method, inasmuch as the meaning of certain parts of speech (prepositions, conjunctions, etc.) is not easily obtained save in context ("to the door," etc.) The word method, which is probably older than the sentence method in our conscious theory, appeared as a conspicuous protest against the tedious and mechanical phonetic methods of traditional practice. Here the total visual form of the word is associated with its whole sound, the assumption being that it is about as easy to learn a word unit as a letter unit. This view holds that the pronunciation of a word is not a sum of its letter sounds, but has its own character as a unit. So the word method is held to be more economical and natural as a mode of teaching. All these assumptions are borne out by the conclusions of experimental psychology. Teaching children to read by words is undoubtedly the chief simple method utilized by progressive teachers, though almost always supplemented by others. Some phonic work is almost always associated with it to give the pupil power to pronounce unfamiliar words by himself.

The word method, like all of the phonic methods, usually tries to bridge the gap between print and meaning through the mastery of the pronunciation, usually given by the teacher in association with the visual form. But like all the other thought methods it is less likely to ignore meanings. The word method has been used in getting direct association between things and their visual symbols, with the oral symbols somewhat subordinated. The association of printed names with pictures on blocks and in books is a characteristic example of the emphasis. The labeling of every possible thing and situation in a child's nursery is an attempt to employ the same means.

The word method alone does not give the child power to read. The words must be recognized as they are grouped in sentences. In consequence the word method is seldom used in isolation from the sentence any more than it is from phonic elements. In established procedure it has been one of the least artificial and most stable of special methods.

As the phonic methods have been chiefly synthetic in procedure, starting from parts and proceeding to large word units, the thought methods have been characteristically analytic. In recent years the method of progressive teachers has been a complex blend, both analytic and synthetic. Familiar sentences are made basic, then phrases are isolated, then words, phonograms, and consonants. Then with some preliminary work in word building or blending of new words, the children's power of identifying the sound of words has been extended by practice to the recognition of new

words, phrases, and sentences made up of familiar units. The complete analytic-synthetic process is not prolonged over weeks, but occurs within a single lesson unit, the first and last exercises of the children being with large combinations expressing real thought. Naturalness everywhere characterizes its procedure. The children's old experiences are used whenever possible, and a multiplicity of artificial devices is done away with. The method of deriving sounds is a good example of increasing naturalness and economy in method. For example, the sound *r*, which in the *Johann Story* of an older synthetic-phonetic system was derived by imitation of a dog's growl, is now merely the first sound of the well-known word "rat," which is pronounced more and more slowly until the sound and the symbol of *r* are isolated, or the common initial element in a list of familiar words beginning with *r* (rat, run, race, rag, etc.) which is emphasized through repetition of itself and variation of its phonogrammic affixes. Again, the diacritical marks are almost crowded out of use by the phonogram. Those memorized are chiefly the long vowel sounds. More are not needed for dictionary reference because children are taught to get the sound by analogy from the familiar key words at the bottom of the dictionary page.

Inevitably the sentence and word methods have given a greater emphasis to real reading for thought. Modern tendency has not been content with that improvement alone. The reading period has ceased to be formal and has become enriched with interesting content. The better teachers have not been willing to take much for granted in the way of experience and oral vocabulary. At any rate, they have tested to see that the necessary basis in experience and vocabulary is present. They have preceded the reading of the text with story telling, conversational lessons, picture writing, and action work. If the children did not seem to have the basis, it was at once provided through objects, pictures, games, dramatization, etc. Then oral reading was successful.

The meaningless subject matter of the primers, devised chiefly for formal drill in phonics and neglecting all appeal to the children's interests, is largely disappearing. The interesting episodes of child life replace them. Children's classics enter — the jingles and rhymes of Mother Goose, the fairy tale, the myth, the animal story, easily memorized songs and poems. The formal reading texts are supplemented by other reading books so that there is no lack of interesting material to give vitality and motive to the children's reading. If there must be formal exercises, they are a subordinated activity paralleling the reading for thought, which is the central and chief occupation of the pupils. Oral reading is a little less conspicuous in the first grade than it was. Quick silent reading with

the whole effort centered upon getting ideas has displaced it somewhat. At first the children tell what they have learned, in their own words or by acting it out. Later, they read the thought to others, more expressively than children used to do because they have better things to read. They have more motive for studying their lessons and reading aloud to their fellow pupils, for reading lessons are more often assigned to groups instead of to the whole class as before. The "letter-by-letter" stuttering or the halting "word-by-word" pronunciation is avoided by emphasizing thought rather than form. A natural speed and phrasing is obtained because present methods favor these habits from the beginning. As an additional safeguard, concert reading has been abandoned.

There are other problems in teaching beginners to read, but most of them are less important in current discussion than those already mentioned. Some prefer to begin reading from script, later passing to print. Others prefer an exclusive use of print from the beginning so as to lessen the number of forms which the child must master, thus decreasing attention to formal work. There are teachers who prefer no beginning text, no basal readers with a systematic treatment of phonetic difficulties. These insist that all that children read at first should be associated with their own lives, so that reading is merely appreciating in visual form what children comprehend and use in speech. Only later, when phonetic difficulties are fairly well mastered, should new experiences come through the printed symbol. Still others stress quiet, silent reading, making it the goal of all their efforts. The relative amount of prepared and sight work is another ground for controversy. The solution of all these minor problems hinges on the larger questions already suggested and treated. II S.

READING UNIVERSITY COLLEGE, READING, ENGLAND. — An institution founded to promote "general, civic, and technical education and research." In 1800 six classes were established in connection with the Science and Art Department, in 1870 University Extension lectures were introduced by the Oxford Delegacy. In 1892, on the initiative of the governing body of Christ Church College, Oxford, the College was established as the University Extension College in conjunction with the Schools of Science and Art, Reading, the latter part of the title being dropped in 1893. Literary and agricultural departments were organized, the latter being connected with the British Dairy Farmers' Association, in 1895. In 1902 the institution became a University College entitled to grants from the Treasury. A horti-

cultural department was opened in the same year. Experimental work in agriculture was added in 1903, and in 1906 new buildings were provided, largely by public subscriptions, and additions were made in 1909. The administration of the College is in the hands of a Court of Governors, a Council, and an Academic Board. The income of the College consists of fees, endowments, and grants from local authorities, the Treasury and the Boards of Education and of Agriculture. The College has not the power to grant degrees but prepares students in day and evening courses for the examinations of the University of London (*q.v.*). It may, however, grant the Diploma of Associate in the various faculties (letters and science), and departments (agriculture and horticulture; fine arts, music, commerce and technical subjects). A department for the training of elementary and secondary teachers is maintained, and recognized by the Board of Education, which gives annual grants for the work. The enrollment of students in 1910 in day and evening courses was 1124, with a faculty of sixty-five members.

REAL PROBLEMS. — See PROBLEMS.

REALGYMNASIUM. — Schools in Germany offering in a nine-year course in science, mathematics, drawing, two modern languages, and Latin. This type of school arose at the beginning of the last century as a concession to the opponents of the purely modern schools by the addition of Latin to the curriculum, as Mecker had already done. The school, which served as a model for others, was the *Köllnische Realgymnasium*, opened in Berlin in 1824. Many of these schools gradually became, under pressure, pure gymnasiums. The rapid technical and commercial development, however, led to the recognition in 1859 of the importance of modern schools, and the *Realgymnasiums* were included in the *Realschulen Erster Ordnung*. After 1882 these schools tended to be crowded out between the *Oberrealschule* and the *Gymnasium*. Since 1900 the *Realgymnasium* is on an equal footing with the *gymnasium* as regards the privileges obtained by graduation.

REALISM IN EDUCATION. — See IDEALISM AND REALISM IN EDUCATION.

REALISTIC TENDENCY IN EDUCATION — The term usually given to the

REALSCHULE

tendency in educational thought and practice to center all instruction around things rather than ideas. This movement had its inception in the seventeenth century and centered on its philosophical side in the writings of Bacon and on its practical side in the work and writings of Comenius. The philosophic aspect is discussed under the caption IDEALISM AND REALISM IN EDUCATION and under BACON; the practical aspect under COMENIUS, FRANCKE, RATKE, HARTLIN, and other leaders in the movement, and under OBJECT TEACHING, OBJECTIVE METHOD. The institutional aspect of the movement is also discussed under ACADEMIES, Real Schools, and the various sciences in the schools.

MONROE, P. *Textbook in the History of Education*, Ch. VIII. (New York, 1906)

REALSCHULE (REAL SCHOOL). — The name by which the secondary schools of Germany, which offer a six-year course in modern subjects, are known. In the historical development of the schools which give a nonclassical education may be traced the influence of many prominent educational leaders, e.g. COMENIUS; RATKE; FRANCKE; SEMLER; HECKER; BASEDOW, and many others; and of several distinct movements, e.g. PIETISM, PHILANTHROPINISM; ENLIGHTENMENT; SCIENTIFIC TENDENCY. The *Realschule* of Prussia may be traced back directly to the schools established by Semler at Halle (1706) and by Hecker in Berlin (1847; now the Friedrich-Wilhelms *Realschule*). Such schools were intended for those who had ability, but not as "students" (i.e. of the traditional studies), and wished to receive preparation for other than the learned professions. Many schools were established in imitation of Hecker's and continued in their development until the New Humanistic movement gave them a setback (See NEO-HUMANISM.) Further, in order to secure admission to the *Reifeprüfung* and the state service many Real Schools added Latin to their curriculum. In spite of much opposition in the two preceding decades, the Real Schools were definitely organized in 1859, through the influence of L. Wiese, as schools for general culture rather than as vocational schools. They were divided into two classes (1) *Realschulen Erster Ordnung*, i.e. schools which offered six and nine year courses, including Latin, and had the privilege of one year military service, and (2) *Realschule Zweiter Ordnung*, i.e. schools offering a six-year course without Latin and having their own leaving examinations without any privileges. In 1882 the nine-year Real Schools offering Latin were recognized as *Realgymnasien*. As a result of the December Conference of 1890 the *Oberrealschule*, with a nine-year course, and the *Realschule* were recognized as definite parts of the secondary school system. Since 1900 all the

RECITATION

nine-year schools, including the *Oberrealschule*, were put on the same footing, so far as privileges are concerned, with the *Gymnasium* and *Realgymnasium*, with the exception that admission to certain professions depends on presenting additional examinations in Latin. The *Realschule* now gives a six-year modern course and graduates are given the privileges of the one year military service and entrance to certain branches of the public service.

RECEPTORS. — See NERVOUS SYSTEM

RECESS. — See PERIOD OF STUDY; SCHOOL MANAGEMENT; SESSION, LENGTH OF.

RECITATION, METHOD OF. — The term recitation is used with various meanings in educational discussion. Originally descriptive of the dominant type of exercise employed in classroom instruction, it came to attach itself to the time period allotted for instruction in a given subject. Thus, the daily lesson of twenty minutes assigned by the administrative time schedule to geography came to be called the "geography recitation" by both teachers and children. Any exercise allotted to a special subject, therefore, was called a recitation, making the term coincident with lesson or lesson period. When the uniformities of teaching methods employed in all lesson periods became a matter of definite theoretic discussion, these general methods of procedure were discussed as "the method of the recitation." The wide and dominant influence of McMurry's *Method of the Recitation* (1807) as a pedagogical text tended to fix an already existing tendency. In recent years many influences have been responsible for broadening the scope of general method and giving the term *recitation* a more restricted meaning. Among these are: (1) the addition of new school studies unlike the traditional subjects in content and purpose; (2) the increased number of pedagogical procedures developed under the influence of educational psychology; and (3) the growing appreciation of extra-schoolroom activities as vital educative processes. The introduction of art, nature study, household arts, manual training, etc., has de-

veloped types of teaching exercises not obviously necessary in the traditional subjects. These have attained a status in the newer fields, and their use has been extended to the older studies. The new psychological insight which has been so active in recent pedagogy has still further enriched our stock of educative methods. And finally, plays, dramatization, sociability, self-government, and other extra-classroom activities have given a still wider conception of the educative process. The result of such a widened view of the school's processes has been to give general method a meaning far more broad than that of a "method of the recitation," whether the phrase be taken to indicate a particular type of teaching or the group of methods generally characteristic of teaching in a class period. To discuss general method as "the method of the recitation" seems more inappropriate when one thinks of shopwork and field excursions. Recitation is apparently not a general method when a dozen other types of teaching are every day employed alongside of it, and finally it must seem, more than ever before, an inadequately descriptive term when educative activities other than those in the classroom come within the scope of our conscious pedagogical theory. Such broader titles as "educative process," "teaching process," "general method," "principles of education," "principles of teaching," etc., perform the wider function of the older "method of the recitation"; and "recitation" requires a narrower meaning as merely one type of exercise in teaching.

There is still a general method of the recitation or lesson period which requires analysis and statement. All lessons have common characteristics, in so far as all classroom teaching is different from other educative activities of the school in being more deliberate and formal. Again the necessity of teaching within an arbitrary time limit imposes certain modifications upon the teaching process. The compulsion to begin a subject anew and to close it at a given time gives a similar mode of beginning and ending to all teaching conducted within a single "recitation" or class period. There is need of a preparatory step or introductory review to pick up the threads of the situation studied the preceding day before the teacher can go on with his presentation. To leave knowledge well organized for an interruption, an application, a summary, or a review is necessary at the end, and if the children are to pursue the study further the teacher must allow adequate time for a clear and well-motivated assignment of work. Whatever activities are undertaken between beginning and closing are themselves subject to limitations which the teacher must take into account. The subject under study must be resolved into a topic or problem capable of effective treatment. This need was first met in lesson plans by making the lesson period the unit of treatment. Now that larger method-wholes

(determined by the nature of subject matter and the teacher's purpose rather than administrative system) are utilized, the teacher makes the detailed readjustments required from day to day, keeping in mind the general characteristics of formal teaching and the limitations of the time unit.

Assuming that all formal classroom instruction has the common characteristic of aiming at the development of logical notions (general notions or concepts derived from particular notions) and modifying this purpose by acceptance of the limitations imposed by the recitation or lesson period, a distinctive general method of the recitation, with formal steps or stages, has been evolved by educational theorists, more particularly by the followers of Herbart. This "inductive development" method of the recitation (as it is called by more recent writers) was originally suggested by Herbart and then variously modified. The lesson unit, as analyzed by Herbart, comprises four steps: (1) cleanness (in grouping details), (2) association (of common qualities or relations), (3) system (in forming and relating judgments), and (4) method (in applying judgments to practice). The first of these steps was subdivided by subsequent writers so that "five formal steps" are usually given by contemporary American and English writers. Renamed, these are: (1) preparation (of the pupil's mind), (2) presentation (of new knowledge), (3) comparison and abstraction, (4) generalization, and (5) application. There is a recent tendency toward still further modification where "statement of the aim" (to give a unifying and motivating problem) is prefixed as a first step, and "assignment" (of the problem and method for further study) is added as a seventh. But in presenting this definite teaching method for dealing with a "lesson unit," it was incorrectly assumed that development of general notions and practices in their application are universally characteristic of all classroom instruction. Liberally construed, such a "method of the recitation" has a wide application in the acquisition of knowledge where generalizations, principles, definitions, and rules are concerned. But the particular facts upon which these rest often call for extended observations and demonstrations wherein these "steps" can scarcely be utilized. Again, it is frequently unnecessary, inexpedient, and even dangerous to teach all general notions by any such series of formal stages. Children can often with economy be told truths, the requisite data may not be at hand; and certain moral truths do not, with safety, lend themselves to an inductive treatment in the manner suggested. Where the teacher is aiming at the development of skill in expression or taste in feeling, this method is not even remotely applicable.

Because of the limited range of the activity

RECITATION PERIOD

within which the traditional Herbartian method of the recitation applies, a broader, more versatile, and less rigidly formal method of treating the lesson unit is coming into acceptance. It is as yet a tendency without clear formulation. In this newer view, all teaching is planned (regardless of the lesson period) on the basis of method-wholes, i.e. a unit of procedure where a single central thought, problem, or topic dominates the entire movement. This large movement in teaching is made up of many lesser movements, which succeed each other as the nature of the problem, the child's psychological need, and the teacher's immediate purpose dictate. Each of these lesser movements has a form which is typical, hence the phrase "types of teaching." Typical modes of teaching are not steps or stages, exclusive of each other, but teaching movements overlapping each other, yet differentiated on the basis of emphasis in form and function. Among such types of teaching are drill, development, study, practice, experiment, objectification, assignment, review, recitation, examination, etc. A single lesson unit is made up of a combination of these, as a method-whole is made up of lesson units. Such a conception of teaching implies: (1) that each type of teaching is a specialized form with a particular function having limitations as well as a given superiority; (2) that each type has a limited applicability and therefore requires other types to supplement it in an effective and wholesome treatment; and (3) that the order in which these occur and the frequency with which each recurs is determined by the aims and conditions involved in the teaching process. This newer conception of the "method of the recitation" is less simple, but more accurate. It commends itself in offering a natural, flexible, and widely applicable substitute for the formal, rigid, and restricted conceptions previously accepted.

RECITATION PERIOD. — See SCHOOL MANAGEMENT.

RECOGNITION. — That phase of a memory process in which the present experience is definitely related to some former experience. Thus, one recognizes a person whom he now sees as identical with the person whom he saw yesterday. (See MEMORY.)

The term is also employed in a somewhat more general way to indicate any completed

form of perception. Thus, one is said to recognize the object before him as a book. As pointed out under the term "perception," every process of this type involves certain memory elements. The book is recognized because elements of past experience are united with the present sensory qualities in a complex mental act.

C. H. J.

RECOLLECTION. — That phase of the memory process in which a past experience is reinstated, thus the process of recollection appears in the bringing into consciousness of the visual image of the face or of the name which was experienced in the past. Recollection thus precedes in the memory process the stage which was described under recognition (q.v.).

C. H. J.

RECORDE, ROBERT (1510?-1558). — English mathematician born at Tenby. After studying at Oxford, proceeding to the M. A., and being elected fellow of All Souls' in 1531, he went to Cambridge, where he read mathematics and medicine, obtaining the degree of M. D. in 1546. He returned for a brief period to Oxford, which he soon left for London, where he practiced medicine and became royal physician to Edward VI and Queen Mary. He also held several official positions, but seems to have died in poverty. Recorde was the earliest of the important English writers on mathematics. His earliest work was the *Ground of Artes* (1540-1542?), an arithmetic which went through many editions till the end of the seventeenth century. The *Ground of Artes* is in the form of a dialogue between master and scholar. Recorde indicates that "if number be lacking, it maketh men dumb, so that to most questions, they must answer Mum." In 1557 Recorde published the *Whetstone of Witte or the second Part of Arithmetic* (a play through the Latin title, *cos ingenii* on algebra as the cosse art, *cosa* being a thing, or the unknown quantity). This work is a treatise on algebra and was probably the best known of Recorde's works. It is mentioned in Scott's *Fortunes of Nigel* as the only book in a house besides the Bible. In this, for the sign of equality Recorde chose the symbol of two parallel straight lines, because "noe 2 thynges can be more equalle." Other works by Recorde are the *Pathway to Knowledge* or the *first Principles of Geometry*, etc. (1551), dealing also with astronomy and astronomical instruments. Recorde was probably the earliest Englishman to accept the Copernican theory, without, however, surrendering his belief in astrology. He also wrote several other works on astronomy and astrology, e.g. the *Castle of Knowledge*, a *Treatise on Astronomy* and the *Sphere* (1551).

Modern Subjects in England. (London, 1909)

RECORDS AND REPORTS — The development of adequate school records and significant school reports may be traced on the one hand to the growth of the profession of education, and on the other to the demand which the public is now making for complete information concerning public enterprises. There was a time when it was customary for school boards or school committees to make a report consisting largely of a statement of their activities in hiring teachers, in building and equipping school plants, and in visiting the schools. To-day teachers are hired and schools are organized and administered by an educational expert, and in like manner school reports are an account of the results secured under the direction of the school's chief executive officer. When school boards told of their activities, the schools were relatively few and the organization simple. The reports which they rendered demanded little in the way of expert knowledge either of schools or of refined methods of recording or reporting school activities. To-day there are many people who judge of the efficiency of a school superintendent in terms of his ability to satisfy any inquiry which may be made concerning the course of study, the teachers, the pupils, or fiscal aspects of the problem with which he deals, together with any interrelation which may exist among these several parts of the whole problem.

It is not easy to distinguish between records and reports. The records which are accumulated in any one field furnish the raw material of the report which is made concerning this aspect of school practice. Original records are significant only as they are combined in such a way as to throw light upon the particular problems involved. Of course it is true that reports commonly include much discussion of school policy which is not based in any considerable degree upon school records. But the demand that is being made with increasing frequency that any problem be supported with a statement of the results which may be expected, makes the relationship between records kept in the school system itself, or derived from other school systems, a matter of primary importance even in that part of the report which is frankly a discussion of future development. Indeed, it may well be claimed that it is a primary function of school records to make known school needs.

It is only in recent years that any considerable attention has been given to the form of the records or reports of school systems. A few years ago a report of attendance, giving the total number enrolled and the average daily attendance, would probably have been considered satisfactory. In addition to the

RECORDS AND REPORTS

record of attendance, one would probably have found a scholarship record kept by each teacher. In the same system one would have found a very simple system of accounting and a report of expenditures distributed among a very few items, such as teachers' salaries, textbooks, stationery, fuel, and possibly a few other items. Quite commonly a large part of the total amount expended was reported as miscellaneous expenses. This tendency to report in terms of totals and averages has been superseded by the demand for all of the facts. Students of education, as well as those who are interested in public enterprises, whether in education or in some other field, have come to realize that it is necessary to know the facts in terms of their distribution, showing the limits or range within which the cases considered lie, the central tendency, variability, and the like, if any adequate interpretation of the situation is to be hoped for. (See GRAPHIC CURVE; STATISTICAL METHOD.) This demand for adequate statistical treatment of school facts is being met throughout the world to-day by an improved system of records and by more adequate reporting. As examples of this development, one might cite the cumulative pupil record card, and the form for reporting fiscal statistics, which have been recently recommended by a committee of the Department of Superintendence of the National Education Association.

Pupil's Records. — Five years ago there were very few cities, probably not more than thirty, in the United States which could, without very great difficulty, furnish a record of a pupil's school life from the time he entered school to the date upon which the inquiry was made. To-day there are more than two hundred cities which have reported to the committee referred to above that they are using a cumulative record card at least as adequate as the one recommended by the National Education Association Committee. A copy of this card is shown on the following page.

Such a cumulative record should be kept for every child throughout his entire school career. From such a pupil record it will be possible at any time during the pupil's attendance in public schools to determine: (1) the amount of attendance of individual pupils for one year; (2) comparative rates of progress in schools having school terms differing in length; (3) classification of pupils by age and grade; (4) classification of pupils for enrollment date—(a) duplicate enrollment in the school, (b) duplicate enrollment in other public schools in the same town or city, (c) duplicate enrollment from other public schools in the same state, (d) original enrollment from all other sources, (5) the number of times a child has been detained in a grade; (6) foreign birth or parentage as affecting progress; (7) kindergarten training as affecting progress; (8) transfers as affecting progress; (9) the

RECORDS AND REPORTS

[illegible]

(1) Last name	(2) First name and initial	ELEMENTARY SCHOOL RECORD SYSTEM — Admission, Dis- missal, AND PROMOTION CARD		
(3) Place of birth.	(4) Date of birth,	(5) Vaccinated,	To be kept for every pupil and sent with the pupil when he is transferred to any school, either public or private, in the city or outside the city. Great care should be used to have the names complete and correct. Write all dates as follows 1912-9-23	
(6) Name of parent or guardian	(7) Occupation of parent or guardian			
(8) Residence. (Use one column at a time. Give new residence when pupil is transferred.)			(9) Date of discharge	(10) Age.
			Years	Months

When a pupil is permanently discharged to work, to remain at home, or because of death, permanent illness, or commitment to an institution, this card is to be returned to the principal's office and a full statement of the cause of the pupil's discharge is to be made in the blank space remaining above.

sideration of the distribution of children by ages and grades. An age grade table is now commonly found in school reports.

Instead of the reports which give the average daily attendance of pupils, we are coming to have reports which tell the whole truth about attendance by distributing the number of days

RECORDS AND REPORTS

attended, as is indicated in the following table.—

DISTRIBUTION OF ATTENDANCE

TIME	BOYS	GIRLS	PER CENT OF WHOLE NUMBER
Attending less than 10 days			
10 days to 19 days			
20 days to 29 days			
30 days to 39 days			
40 days to 49 days			
50 days to 59 days			
60 days to 69 days			
70 days to 79 days			
80 days to 89 days			
90 days to 99 days			
100 days to 109 days			
110 days to 119 days			
120 days to 129 days			
130 days to 139 days			
140 days to 149 days			
150 days to 159 days			
160 days to 169 days			
170 days to 179 days			
180 days to 189 days			
190 days to 199 days			
Total (equal enrollment for term)			

In like manner, tables which give enrollment, promotions and non-promotions by grades and by causes, failures by studies and by grades, withdrawals by ages, by grades, and by causes, are becoming more and more common in school reports.

Fiscal Statistics.—The demand for better fiscal statistics is well illustrated by the form recommended by the National Education Association Committee. (See U. S. Bureau of Ed. *Bulletin No 3, 1912*.)

A few years ago very few cities could have distributed their expenditures in any such manner as is indicated in this form. It was not common either to indicate as clearly as is demanded above the purpose for which money was spent, or the particular type of institution or activity for which money was used. There are to-day four hundred and eighteen cities reporting to the National Education Association Committee that their system of accounting enables them to give reports at least as adequate as that indicated in this form. This means, of course, that there has been in recent years an increased addition to the business aspect of school administration. In many cases it means that a special officer, variously called a business manager (*q v*), a secretary, a controller, or a school auditor has been added to the staff employed by the Board of Education. Hence, it is now possible, on the side of fiscal statistics, to have reports which attempt to analyze expenditures in such a way as to show the total cost per pupil in various grades or types of schools, the cost per pupil for various items, such as instruction, books and supplies, fuel, and the like, and in some cases a careful analysis and comparison is made of costs among the several units of the school system, as, for example, upon the basis of school buildings or plants.

RECORDS AND REPORTS

Salary Reports.—Further illustration of the more adequate form of report may be indicated by calling attention to forms of reporting now commonly used in our school reports. It was not unusual a few years ago to have school salaries reported as a single item. Manifestly the truth about salaries can be known only when we know how many teachers receive each of the several amounts, as indicated in tables like the following, which are now not uncommon.—

NUMBER OF ELEMENTARY-SCHOOL TEACHERS WITH SALARIES—	NUMBER OF HIGH-SCHOOL TEACHERS WITH SALARIES—
Below \$350	Below \$500
\$350 to \$400	500 to 600
400 to 450	600 to 700
450 to 500	700 to 800
500 to 550	800 to 900
550 to 600	900 to 1000
600 to 650	1000 to 1100
650 to 700	1100 to 1200
700 to 750	1200 to 1300
750 to 800	1300 to 1400
800 to 850	1400 to 1500
850 to 900	1500 to 1600
900 to 950	1600 to 1700
950 to 1000	1700 to 1800
1000 to 1050	1800 to 1900
1050 to 1100	1900 to 2000
1100 to 1150	2000 and above
1150 to 1200	
1200 and above	

Securing Publicity.—In the newer type of report, it is common to illustrate with charts, diagrams, and pictures. There is an attempt made to tell the story in such a way as to interest the reader as well as to convey information to the specialist. In some cities definite plans are made for publicity through the newspaper, or in some cases by issuing partial reports on special subjects of interest from time to time throughout the school year.

Report in Cycles.—Another interesting development in modern reports is the appreciation of the fact that it may not be wise to attempt to cover every subject with equal completeness each year. It may be argued that the best report is the one which specializes upon some one aspect of the school problem once in three or once in five years. Of course it is necessary, if such a cycle of reports is instituted, to give the essential facts each year. If, for example, the following cycle were followed: first year, curriculum, including special schools and special classes; second year, finance; third year, pupils, fourth year, teachers; fifth year, buildings and equipment,—the report would undoubtedly convey certain information concerning each of these fields each year. On the other hand, in each of the five years the topic which was considered the special order for the year would be treated exhaustively. In so far as statistics or reports are valuable for the guidance of those who administer our schools, there would be great advantage in the adoption of some such plan as indicated above.

RECORDS AND REPORTS

To have an exhaustive treatment of a topic once in five years would be just as satisfactory as to have the topic treated with like fullness each year. Since space and effort must be economized, there is manifestly a very great advantage in treating in successive years several different topics, and then returning to treat each of these topics again after the lapse of a definite period.

Uniform Reports — Possibly the most interesting development in recent years is found in the demand for uniformity in recording and reporting. Our state education officers have demanded uniform reports within the state. For the most part, these reports have been very inadequate, and have been thought of as significant mainly in so far as the information derived was used as a basis of determining the aid given to the local community from the state. The movement for uniformity, which has taken form in the National Education Association in the appointment of a special committee on uniform records and reports, may be expected in time to affect the state officers as well as city school systems. This committee has, since its appointment, worked in cooperation with the United States Bureau of Education, the Census Office, and the Association of School Accounting Officers. These four bodies have agreed upon a uniform program. The United States Bureau of Education has from time to time modified its schedules in accordance with the recommendations of the joint committee. The Bureau has also invited state and city superintendents for conferences, and has sent out its forms for criticism to city and state officers before issuing them in permanent form. It is to be expected that from this campaign of education there will come a realization of the importance of uniformity as well as greater interest in records and reports. Uniform reports will enable school administrative officers to study more adequately their own situation in the light of a comparison with other similar areas.

Hope for more adequate recording and reporting is to be found, too, in the increased demand made upon those who would enter the profession. Courses in school management and in school supervision and administration in normal schools and colleges are to-day sending students into the field with some appreciation of statistical method, and with some acquaintance with the best practice with respect to records and reports. The movement for adequate records and reports is a part of the development of a science, as well as of a profession of education. The demand upon the part of the public for such adequate information is even greater than the demand for efficiency in teaching. C. D. S.

RECTOR — A term used frequently of the chief officer of a school or university. It is found in the sense of schoolmaster, tutor, or preceptor in the Roman writers of the first century A.D. And it may be that it was this use of the term which was revived in Germany and Scotland (as early as the twelfth century) for the head master of a school. In Scotland the term is in a few cases synonymous with *Magister Scholarum*. In Scotland the head master of the high school is still called Rector. In Germany the title *Rektor* is still used for the principals of secondary schools in Saxony and Württemberg, in Prussia secondary school principals are called *Direktoren*, but principals of elementary schools are known as *Rektoren*.

The term is, however, in more general use in connection with university administration, and in this use goes back historically to the University of Bologna. It seems now well established that the term was borrowed from its use in Lombard towns to refer to the chief magistrate. The Rector of the University was thus the chief executive officer. At Paris each nation had a "rector" until the four nations combined to have one rector over the whole body of students, the heads of the nations later being called proctors (*q.v.*). At Oxford and Cambridge the term "rector" was for a time equivalent to proctor. At present it is used only of the heads of Exeter and Lincoln Colleges, Oxford. In Scotland the position of Rector or Lord Rector of a University is honorary and is bestowed by election among the students upon men who have distinguished themselves in public life. In France the *Recteur* is the official head of an Academy with particular charge of the University. The term is not used in America, but for a few years subsequent to 1870 the title of the President of Harvard College was changed to Rector. The term is regularly used of the heads and principals of Catholic colleges and seminaries all over the world. See, for further details, UNIVERSITIES; FRANCE, EDUCATION IN; GERMANY, EDUCATION IN; ITALY, EDUCATION IN; SCOTLAND, EDUCATION IN; PROCTOR, etc.

REDISCOVERY

REDISCOVERY, METHOD OF.—In the teaching of science and mathematics, the method of using objective materials and laboratory experiments is a matter of controversy. Three views are held as to the way in which data should be presented: (1) The order of experiment should be that of the original discovery, the experimentalist rediscovering the conclusion. This is the so-called heuristic method, the method of discovery or rediscovery. (2) The procedure should be that of mere verification or proof, the facts being presented, without regard to the original mode of research, in the most economical order consistent with bringing about conviction in the learner, scientific standards of truth being kept in mind. (3) The method should be that of personal inquiry or investigation on the part of the student, a problem for solution being presented to the student who is to use all his knowledge and ingenuity in devising ways and means, the instructor being secondary and merely supervisory.

The worth of these methods has been much discussed, particularly in the objective teaching of mathematics in the primary school and in the laboratory teaching of physics and chemistry in the high school. Present tendency seems to favor the large supplementary use of the two latter methods. The two abilities requisite in adult life are (1) the common ability to appreciate proof and to verify conclusions, and (2) the less common ability to conduct an investigation on unsolved problems. A reproduction of various steps in so-called rediscovery (heuristic method) is open to the objection that in no essential psychological sense is it true discovery or rediscovery. The child is not conscious of the problem, to begin with, nor is he mentally pushed to devise the successive stages; too often he goes mechanically through an order prearranged by the laboratory manual or teacher. He gains a proof, but in a wasteful manner. The method of verification gives all that so-called rediscovery does, and does it more clearly and more economically. The occasional use of the method of personal inquiry gives what is aimed at in rediscovery. Its occasional use establishes the use of the child's capacities in real scientific inquiry. It begins with a problem in which the student himself is interested, and which stimulates him to the suggestion and criticism of ways and means and to the making and checking of conclusions. The relative use of verification and inquiry as supplementary methods depends on the intellectual maturity of the child and the complexity of the problems presented.

REFLEX, REFLEX ACT OR ARC.—See **INSTINCT; NERVOUS SYSTEM**.

REFORM SCHOOLS.—A term used with various significations. In Germany it refers to the modified gymnasium where Latin is begun in the third and Greek in the fifth years. The system is adopted to avoid the evil of too early determination of the scholastic and vocational career of the child. (See **GERMANY, EDUCATION IN**.) In England and elsewhere it is sometimes used to indicate schools representing a radical departure from traditional methods and curriculum. This type is more particularly defined under the caption **EXPERIMENTAL SCHOOL (q.v.)**. In the United States the most common use of the term is to indicate a class of institutions for juvenile delinquents, which have more of a penal than an educational significance, and it is in this sense that the term is used in the following article.

Origin.—The origin of the reform school is obscure. As early as the seventeenth century in Amsterdam, morally depraved children were segregated, not, however, for the purpose of reformation, but to relieve and protect society. Francke (*q.v.*), in his efforts to save orphans, was the first to suggest the value of separate institutions for delinquents. In Italy, England, and France such social reformers as Cesar Becaria, and John Howard urged the separation of juvenile from adult criminals in almshouses and prisons and provision for special treatment. Pestalozzi, at Neuhoft and Stanz, discovered some of the special needs of unfortunate and depraved children.

The earliest formally organized reform schools were a school near Birmingham, 1817, the New York House of Refuge, 1824, the Rauhes Haus (*q.v.*), founded by Wickers (*q.v.*) and his mother, at Horn, near Hamburg, Nov. 1, 1833, and the famous school organized by Dornetz, who received the inspiration from a study of American reformatory institutions, at Mettray, France, in 1839. The English school, after a successful existence of several years, was closed because of the death of its founder, the others still exist and have long served as models, especially the French school, regarded as the most noted juvenile reformatory in the world. Schools patterned after these three are now found in every civilized country.

Types and Number of Institutions.—In the United States there are now about 120 public and private reformatory or disciplinary schools, variously named and organized. The earliest schools were much like the House of Refuge in New York City, and a number of them still bear that name. These are situated, as a rule, in or very near large cities and have much of the prison about them. After some years of experience such institutions were called "reform schools," or juvenile reforma-

REFORM SCHOOLS

torics, were located in the country, and were more like schools and less like prisons. In recent years, and at present, the term "industrial school" has been applied and well indicates the change in the organization. In some instances the name of a noted prison has been used as a title in order to avoid the stigma of an explanatory title. The three kinds of names fairly well indicate the growth of the ideals of reformation. Some older institutions still exist largely unaffected by progress, but in the main there has been improvement, and never more than in the present decade.

Nearly all of these schools are supported by public funds either directly, as in the case of a state reform or industrial school, or indirectly, as where a certain per capita amount is paid by the state, county, or city for maintenance of some private institution. Subsidizing private agencies is done upon the claim that the same service can be secured at less cost to the state—charity, philanthropy, and religion supplying the deficit—and that private care is more acceptable to certain parents. Of necessity the per capita cost, varying from \$100 to \$300 per year, in both is very much greater than in the case of the normal school child. In the Middle and Western states these schools are supported entirely by the state, or city in the case of parental schools, while in the older Eastern states, notably New York, private and religious bodies share the duty. Where there is a cosmopolitan population there is a tendency to place delinquent children in institutions of the parents' faith. As public funds cannot be used to maintain institutions under religious control, various private schools have been organized. For this reason, four kinds of reformatories for each sex exist in some of the older states—state, Protestant, Catholic, and Hebrew.

The Catholic Protectors, with three divisions—one for girls, one in New York City, and one in the country for boys—is the largest correctional school in the world. While the children are given excellent trade training and a good literary education, stress is laid upon religious training. The Jewish Protector at Hawthorne, N.Y., is a model of location, organization, and equipment.

Control—The control of reform schools is usually vested in a board appointed by the Governor, or in a board made up of members of the same religious faith. State reformatories are classified and managed by the same authorities which control the penal institutions. Efforts have been made to make the reformatory a part of the state school system, but without success. Such a change would involve a complete change in ideals and organization. As a rule, men and women experienced in prison management are in charge. Where school men have been tried, they have usually failed. As reform schools

REFORM SCHOOLS

are historically penal, it may be unwise to attempt to change them into special public schools. On the other hand, parental schools, of which there are an increasing number, are offshoots of large public school systems. The spirit and organization are essentially those of a school. The two types of such different origin may in time grow into the ideal institution for the prevention of crime and the reformation of the wayward.

Types of Housing—The three kinds of housing, congregative, pavilion, and cottage, found in eleemosynary institutions are used in reform schools. The early institutions of both Europe and America were all of the congregative type, although Volmarstein established two reform schools, one in Overdyk (1816) and another at Dusseltal (1822), upon the decentralized plan. Wickern used the same system at Horn (1833). In recent years the cottage plan has become popular with boards, a good many schools abandoning old congregative buildings and erecting, with pupil help, cottages containing from fifteen to fifty pupils, in addition to officers. The cottages of the New York State Training School for boys at Lake Mahanias are to house fifteen boys and two employees. The distribution and location of the cottages are important. In the above institution—a model of its kind—the cottages are in three groups, the industrial group, with cottages 300 feet apart; unskilled laborers' group, for boys who need very close supervision, houses near each other; and the agricultural group, with cottages at least 500 feet apart. A number of individual cottages are isolated in order to foster as much family atmosphere as possible. One obstacle to the growth of the small cottage plan is its cost.

Commitment—The age and conditions of commitment vary somewhat. Few boys are committed before their eighth, and, as a rule, none are accepted after their sixteenth birthday. Girls may be committed at eight but seldom are, they are received up to eighteen years in some states. The average age of girls in a reformatory is always higher than that of boys. There are seven boys in the reform schools of the United States for every two girls. The average age of commitment in the larger institutions is fourteen years three months for boys and fourteen years nine months for girls. The term of commitment varies in length from a few months to several years. In most cases, the sentences are for one year, eighteen months, two years, or until the person becomes of age. In Great Britain and Ireland, the Children's Act of 1908 makes the penal age twelve years. Below that age children accused of crime for the first time may be sent to an industrial school; also children between twelve and fourteen years, if it is their first crime. Others under sixteen years can be sent to reform schools. In France the act of April 12, 1906, places the penal ages

REFORM SCHOOLS

from twelve to eighteen years. In the German Empire the ages are the same. The orphans' court, however, may commit a younger child. The institution authorities determine the time of detention, although no delinquent may be detained longer than his twenty-first birthday. April 17, 1909, the Russian Emperor took under his protection all institutions for the reforming of minors, and established a new plan of treating offenders of a tender age. The new laws are similar to those in the other nations. In Holland the penal minority is eighteen years. Between sixteen and eighteen the judge may consider them as adults. There is a tendency to give the institution custody of the delinquent until twenty-one years old, especially in the case of girls. The parole and probation systems have shortened the term of commitment, but lengthened the period of custody. Reform school authorities complain because of the short sentence — it gives so little time in which to establish new habits and, without probation, often leads to recommitment. As better facilities are developed for after care it is likely that the control of delinquents will be extended to the end of minority.

Discipline is the watchword of the reform school. In the early schools the discipline resembled that of the prisons. Reformatories still exist where boys or girls are locked into cells each night, surrounded all day by high stone walls, and marched in squads from one task to another. Such institutions are in charge of penologists. Fortunately there are other institutions where none of these forms of discipline exist. It is difficult to get away from the idea of punishment as the basis of discipline, to training as such a basis. The credit system is in common use. The boy receives credit for good conduct and demerits for misbehavior. Nearly all items of bad conduct are valued in demerits and range from impudence to escape. By continued good conduct the boy earns a parole in about three quarters of the term of his sentence. While on parole he must report in person or in writing at regular intervals to the school, he is regularly visited by a parole officer. Effort is made to place the boy in a good environment. There is an increasing amount of parole work, and the results are generally good. However, it is hard to find suitable homes for some. Colored girls are difficult to place out, as are mildly feeble-minded cases. A few states are now making provision for the latter class in separate custodial institutions.

Daily Program — The daily schedule of duties of a reform school boy attempts to use all of his waking hours. While there is play or recreation, it is usually under supervision, — always under surveillance. The following is an average schedule. —

5:15 Reveille

6:15 Waiters and kitchen boys report.

REFORM SCHOOLS

6:30 Breakfast.
7:00 Details for work.
8:00 Details for school and industrial training.
11:30 Prepare for recall.
11:45 Waiters report
12:00 Dinner
12:30 Details for kitchen.
1:30 School and industrial training.
3:30 Recreation.
4:00 Military drill.
4:30 Recreation.
5:40 Waiters report.
6:00 Supper
6:30 Reading and games.
8:30 Taps.

School work and industrial work alternate each half day. The course of study is a simple one, and emphasizes the rudiments, for as a rule the pupils are far behind in their studies. The average classroom instructor is below the standard of the public school, skilled teachers being difficult to secure. The industrial work is better than the school work for two reasons, — the pupils like such work better than the classroom exercises and it is usually possible to secure better teaching. The range of agricultural instruction includes farming, gardening, horticulture, stock raising; all are profitable to the institution and popular with most boys. In American institutions, however, where city boys are committed, the agricultural occupations are not popular with the majority. The trades, printing, painting, papering, and decorating, shoemaking, tailoring, plumbing, gas fitting, etc., are taught in all the large reformatories. Often the motive is occupation and product rather than training. Some boys and girls acquire skill in the trades, but the majority get little. The time is short, the pupils unwilling, the teachers often uninteresting, and an educational motive absent. Improvement in industrial training is noticeable, however.

Classes of Delinquents — Institutions for the reformation of incorrigible minors recognize two classes of delinquents. One type exists for the prevention of crime and the correction of younger children, really misdemeanants; the other for the older and more depraved. The first type is of more recent origin and is more effectively reformatory. A good example is the New York Juvenile Asylum or Children's Village, at Dobbs Ferry, admitting truant and disobedient children between the ages of seven and sixteen years. England has a large number of schools of this type.

Tendency. — The tendency is toward adequate buildings, better organizations, kinder discipline, more agricultural and industrial training, and more generous support. Institutions are being located in rural communities. In most states and countries children are the legal wards of the state until their majority. Placing out in good homes under state supervision is increasing. Two types of schools are

REFORM SCHOOLS

developing, one preventive, the other curative. More attention is given to the problem of reformation, it being now regarded as a question of reeducation rather than one of retribution. While the percentage of reformed delinquents is still low, the outlook is promising. A. H. Y.

The Industrial Schools of Great Britain are perhaps the most important and most numerous type of reform schools. They are under the control in England and Wales of the Home Secretary and in Scotland of the Secretary for Scotland. They grew out of the ragged schools (*q.v.*), but the first legislation concerning them was in 1854 in Scotland and 1857 in England. These acts, with their amendments, go down to the famous children's act of 1908, the so-called "Children's Charter." These schools are of various types, including town or country schools, town schools, suburban schools, slum's schools and girls' schools. They number in all 140; 108 in Great Britain, (including eight schools for mental defectives) and 32 in Wales and Scotland. They maintain about 18,000 children. In the investigation of these schools now being made by the government the transference of these schools to the board of education is being considered. The entire subject is dealt with in detail from various angles under different captions. For the general legislative and social background see the article on CHILDHOOD, LEGISLATION FOR THE CONSERVATION OF, and those on JUVENILE DELINQUENCY, JUVENILE COURTS, and JUVENILE PROBATION, for those dealing with the defectives, see DEFECTIVES, EDUCATION OF and SPECIAL CLASSES; for a closely related type see the article on POOR LAW AND EDUCATION.

REFORMATION, THE, AND EDUCATION — There are few subjects on which greater diversity of opinion has been and is expressed than on the relation of the Reformation to education, the natural result of the diversity of opinion which has been and is held as to the Reformation itself. One point, however, recent research has now definitely settled, that neither in institution, method, nor matter is the education of post-Reformation times separated by any great gulf from that of pre-Reformation times. The Reformation was undoubtedly a revolution. But as is the case with other revolutions the change it effected has been exaggerated alike by its friends and by its foes. Neither in Germany nor in England nor in Scotland is it now possible to believe (except by those who either have not seen or refuse to look at the evidence available) that Luther or Cranmer or Knox created a new heaven and a new earth in the sphere of education or that the schools of those countries, and by consequence of America, were a new birth due to the genius of the reformers. In every branch of life research tends to show that growth never proceeds *per saltum*. In education, above all, the continuity of institutions from the ancient to the modern world has now been demonstrated. An initial difficulty in discussing the relation of the Reformation to education is that of settling when the Reformation took place. It might be dated from Wycliffe or from Petrarch as well as from Luther or Erasmus. Certainly it is only a particular manifestation of the Renaissance (*q.v.*), itself as undefined and almost as undefinable a term and period as the Reformation.

Germany. — The Renaissance in Germany is closely related to the Reformation, especially in its spirit and in its outcome. The characteristic features of this twofold movement in the north arose from the fact that the civilization of the Latin countries was based directly upon the ever-present classical institutions, while the civilization of the Teutons was a direct outgrowth of their Christianization and its consequent moral and religious bent. Hence the logical outcome of the reformers' work would have led to a continuous development of the Renaissance emphasis

upon the use of reason as the guide to the interpretation of secular life and of nature, upon the restriction of the authority of the Scriptures to religious matters, and upon the use of reason by the individual even in the interpretation of the Scriptures. But the tendencies in all of these lines were checked before the expiration of a single generation, and so we find Luther, who had earlier called reason "a something divine," towards the close of life holding the view that "the more subtle and acute is reason, the more poisonous a beast, with many dragon's heads, is it against God and all His works." While on the one side the Renaissance-Reformation period is marked by the humanistic tendency, on the other it developed into a narrow formal scholasticism. Theoretically, the doctrine of the Reformation involved liberty of conscience, in practice intolerance and bigotry prevailed. Religious thought was compelled to flow in the channels marked out for it by the rules of the numerous political divisions. Not only was intellectual life thus bound within narrow limits, but the education of the schools, higher and lower, took its purpose and received its spirit from the same formal and narrow interest. Hence it was that the Reformation failed to produce during the sixteenth century those intellectual and educational results which were logically involved in the basal positions of the reformers so far as these related to free learning, the spread of culture, and the development of science. The very fact that the Reformation was a revolt against existing conditions was calculated to introduce chaos, and it is difficult to agree with those who would minimize the educational provisions existing before the Reformation, for the purpose of exaggerating the immediate effect of the Reformation. It is clear from contemporary statements that the Reformation failed to produce during the sixteenth and seventeenth centuries the intellectual and educational results anticipated. Thus Erasmus, in writing to Parkheimer, says "Where Lutheranism rules, there the sciences are neglected," and elsewhere he writes of Luther that "he loads the classical studies with hatred and contempt which is fatal to us and not helpful to him." And Luther himself may be quoted; in a letter to the Burgomaster and Council at Rothenburg in 1533 he writes that "there is a great and sad deficiency in learned people . . . so that many parishes and schools are left vacant," and in his sermon *On Sending Children to School* he laments the decline of the higher schools at Erfurt, Leipzig, and elsewhere. At the same time, a few of the Reformation leaders were opposed to the new learning; both Melancthon and Luther attack higher schools and universities as "the devil's schools," but they were willing enough to call in the new learning to their aid as a means. But there were other reformers, as Professor Karlstadt of

the University of Wittenberg, who was opposed to learning of any kind, because "all knowledge of the Holy Spirit worked through faith."

But if learning declined for a brief period or tended to develop a spirit of formalism and narrowness, educational activity was none the less great throughout the sixteenth century. Something had to be done to replace the old system of education, which the Protestant revolt had undermined, but while new systems were established, their development was along different lines. These systems were based upon the idea of universal education, but their chief function was to develop the religious practices and beliefs, and the ecclesiastical affiliations and interests of the child, for upon these depended his eternal welfare. Since in theory the eternal welfare depended upon the application of his own reason to the revelation contained in the Scriptures, it became necessary to give ability in reading and to train the rational powers. Religious material, and the linguistic training necessary for the use of such material, constituted the bulk of the subject matter. Such methods were used as would cultivate a respect for authority and tradition, and would produce a dialectic ability in exposition and argumentation. On the institutional side of education, the schools were either controlled completely by the Church or, in many Protestant countries, by both State and Church; for even where the State exercised formal control, both the teaching and the direct supervision were chiefly in the hands of ecclesiastics. The full development and completion of the educational principles involved in the Reformation awaited the growth of the political idea that the welfare of the state depends on the education of the individual citizens.

In practice, the schools were accordingly intended in the main to give suitable preparation for religious life and study. Educational theory, however, was more progressive. Luther (*q.v.*), in a well known passage, says: "Were there neither soul, heaven, nor hell, it would still be necessary to have schools for the sake of affairs here below . . . The world has need of educated men and women to the end that the men may govern the country properly and that the women may properly bring up their children, care for their domestics, and direct the affairs of their households." Schooling was to be brought to all the people, noble and common, rich and poor, it was to include both boys and girls—a remarkable advance, finally, the state was to use compulsion if necessary. Nor was the elementary curriculum to be confined in the main to religious instruction; "My opinion is that we must send boys to school one or two hours a day, and have them learn a trade at home for the rest of the time. It is desirable that these two occupations march side by side." In the

REFORMATION

secondary schools Latin and Greek constitute the bulk of the curriculum. To these languages Luther adds Hebrew, and also attempts to bring this linguistic education within the reach of all. Room is also found for the logic and mathematics demanded by the times and a new emphasis is laid on history, science, and music. Finally, as a city is at a great expense each year for the construction of roads, the fortifying of ramparts, and the equipment of soldiers, it should for its own defense and prosperity support one or two schools, and make attendance compulsory.

The practical outcome of the Reformation influences is seen in the number of church and school ordinances, visitations, and general articles. Educationally these different measures aimed to secure school facilities with adequate support, the selection of suitable teachers, and the provision of supervision. The end aimed at was, as already stated, instruction which would enable the people to follow church services intelligently. The leaders of the Reformation naturally took an active part in drawing up the church and school ordinances. Thus Luther took part in framing the *Kirchenordnungen* of Wittenberg (1523), Leisnig (1523), and Magdeburg (1524), all of which contained educational provisions. But Melancthon more than any other person was concerned either entirely or in part in framing such ordinances, in general, however, for secondary schools (Latin schools and gymnasia). He was connected with the following systems, Nuremberg (1526), Saxony (1528), Herzberg (1538), Wittenberg (1545), Eisleben (1525), Cologne (1543), Mecklenburg (1552), Palatinato (1550), Pfalz-Zweibrück (1557). Bugenhagen (*q v*) was almost as active in northern Germany, producing ordinances for Brunswick (1528), Hamburg (1520), Lübeck (1531), Pomorania (1535), Schleswig-Holstein (1537), Brunswick-Wolfenbüttel (1543), and Hildesheim (1544), etc. The work of these two men served as models for innumerable others. The most comprehensive of the early school ordinances is that of Württemberg (1559). The early Saxon ordinance of 1528 had dealt merely with secondary schools. The Württemberg ordinance provided a system of schools for all the people, from vernacular schools, teaching reading, writing, religion, and sacred music, through Latin schools with six classes, up to the university of Tübingen. The Saxon plan was revised in 1580 to incorporate the elementary schools, and borrowed largely from Württemberg. Other states and cities adopted similar systems, but it was not until 1610 that compulsory education for all children from six to twelve was introduced, in Weimar. The culmination was reached in Gotha in 1642, where the first really modern system was introduced by Duke Ernst the Pious (*q v*). (See *GOtha, School Reform in*.)

REFORMATION

The history of the universities of the German states during the sixteenth and seventeenth centuries is determined by the progress of the Protestant religion, and is almost identical with the development of Protestant theology. Wittenberg, founded in 1502 as the first university of the new learning, became through the residence of Luther and Melancthon the very center of Protestantism. The universities gradually threw off their allegiance to the pope and transferred it to the temporal princes. Since their support was now derived from the favor of these governments instead of from ecclesiastical sources, the control exerted by the princes became determinative, and many of them followed the occasional change in denominational adherence of the reigning families. To a considerable extent their support came from the dissolution of old monastic and ecclesiastical foundations. Marburg, founded in 1527, was the first of these Protestant Universities, while Königsberg, Jena, Helmstedt, Dorpat, and a number of others were added within a century. Within this same period seven Roman Catholic universities were founded within the limits of the German states. Several during the same period grew out of gymnasia, as the one at Strassburg (1621) from Sturm's school, and the one at Altdorf (1578) from a famous institution at Nuremberg. Both of these were Protestant. While the work in many of these was of a high character, and the influence great,—Altdorf, for example, though very poor, is said to have contributed more to philosophical study than all of the universities of the British Empire,—yet, in general, by the seventeenth century the activities of these institutions degenerated into the lifeless formalism previously mentioned. A German historian remarks that the dominant theological interest "called into existence a dialectic scholasticism, which was in no way inferior to that of the most flourishing period of the Middle Ages, either in the greatness or minuteness of the careful and acute development of its scientific form, or in the full and accurate exhibition of its religious contents." I. L. K.

England.—Fortunately for the cause of culture and educational progress, England, the birthplace of Protestantism, revised the principles which it had almost trampled out, when they were reimported as "made in Germany." The seeds of Wyclifism were still living when the London grocer who founded Sevenoaks Grammar School in 1432 expressly provided that its master was by no means to be in holy orders, and when the Town Council of Bridgnorth in 1503 made an order that "there shall no priest keep no school

after that a schoolmaster cometh to town but that every child do resort to the common (i.e. public) school." Colet, Dean of St. Paul's, who traveled with Erasmus, derided the relics at Canterbury, and in the catechism in English which he gave for use in his St. Paul's School (augmented and refounded in 1510 to 1512, the government of which he transferred from his own chapter to the lay Trade Company of Mercers) he defined "the Communion of Saints" in the Creed as being "the clean congregation of the faithful people in grace and communion of saints only in Christ Jesus," words almost precisely the same as those afterwards used by Luther to define the Church. When Bishop Waynflete in 1480, Bishop Alecock in 1490, and Bishop Fisher in 1510 suppressed Selbourne Priory and St. Radegund's nunnery and St. John's Hospital to find endowments for Magdalen, Jesus and St. John's colleges, the spirit of the Lollards was not dead, and the doctrine of Luther was anticipated. The two great colleges founded by Cardinal Wolsey, who had himself begun life as Headmaster of Waynflete's Magdalen College School at Oxford, for university scholars at Cardinal College (now Christ Church), Oxford, and grammar scholars at Ipswich, depended on a Papal bull of 1523, which suppressed some thirty priories, to provide the endowment. The Ipswich College alone, for only fifty scholars, against the seventy of Winchester and Eton, was endowed with ten suppressed priories headed by that of St. Peter's.

But perhaps the most remarkable instance of the attitude of even the highest placed in Church and State is the meeting summoned by William Warham, Archbishop of Canterbury and ex-Chancellor of England, in pursuance of a letter from Wolsey, Archbishop of York and Chancellor of England, in June, 1525, at Tonbridge, Kent, to discuss with the inhabitants, apparently at the suggestion of the rector of Cranbrook, the conversion of their Priory into a "free schole of gramer" for forty "scholars, monny's children of those parties, and they afterwards to be promoted to Oxford, having exhibition for their lynding at schole there." The majority of the inhabitants indeed declared that they think it "more expedient to have the continuation of the said monastery." In consequence, the erection of Tonbridge school was deferred for another generation. But nothing can be more significant of the general attitude of mind toward the most striking result of the Reformation, the suppression of monasteries, than this meeting discussing the conversion of the Priory into a school with less heat than they discuss to-day a new scheme of the Board of Education or the Charity Commissioners. Such straws as these show that the wind which blew down the monasteries in England did not arise from the breath of King Henry VIII

desiring to substitute a young and pretty for an old and ugly wife. Henry VIII, the most absolute monarch in Europe at the time, did not precipitate, but delayed and diluted, the Reformation in England. For this very reason when it did come its two great manifestations, the repudiation of Rome and the dissolution of the monasteries, were effected with far greater suddenness and far more startling completeness in the centralized government of England than in the semidetached states of Germany.

Reconstruction took place as rapidly as destruction. Thus the monastic priory of Durham was surrendered to the Crown on December 31, 1510; on May 12, 1511, it was refounded as a church of secular canons and reendowed four days later. At Canterbury, the chief and greatest of the monastic cathedrals, the transmutation was even more rapid. The surrender took place in March, 1511, and the refoundation on April 5, 1511. In both places, as in the seven other cities in which the secular clergy had in the tenth, eleventh, and twelfth centuries been turned out of the cathedrals for monks and in which the monks were now in turn ejected for the secular clergy, grammar schools and exhibitions to the universities were made important parts of the new foundations. Winchester alone and Norwich were exceptions. At Winchester the careful Henry, or his adviser Crammer, very properly thought that St. Mary's College, the great foundation of William of Wykeham, amply met more than all the requirements of cathedral grammar schools (*q.v.*) and did not wish to set up rival schools or reduplicate functions. The town of Norwich had petitioned for a hospital served by Augustinian canons for a magnificent new schoolhouse; and Henry provided for this by his will as he had not had time to carry it out in his lifetime, and it was completed by the Protector Somerset.

There had been, of course, grammar schools under the control of the bishops, not of the monks, in all these places before, but they were unendowed and formed no part of the monastic foundations, and a dozen charity boys serving as choiristers had been maintained and educated in their almonry schools (*q.v.*). The new schools were placed in a very different position, with salaries for the masters double those of the two great schools, Winchester and Eton, and provision for boarding scholarships on their model, ranging from fifty at Canterbury to eighteen at Durham, in addition to song schools for the choristers varying from ten to six in number. Similar provision was made in the five new cathedrals established out of monasteries where there had been no bishops' sees before, including Westminster. In none of these places had there been endowed grammar schools, or at least not adequately endowed, nor except as regards the almonry

boys was education at all maintained or subsidized, taught or governed, by the dissolved monasteries. In all of them Greek was for the first time required of the head master, though Latin only of the usher. The addition in a single year therefore of ten great public boarding schools richly endowed and with ample university scholarships, no less than twenty-four at Canterbury and twelve at Worcester, to the provision made for the highest education was a record in the history of schools. This is a remarkable refutation of the views of the feeble-minded semi-Reformers of the day and their lately resuscitated theories that the Reformation did not advance but retarded education. Nor was this all. Other monasteries were, like Thornton Abbey, Lincolnshire, converted into collegiate churches (*q.v.*) with similar grammar schools attached. But of these it is useless to speak except in vindication of Henry's action, as they were abolished again under Edward VI. Cranmer regarding the canons of collegiate churches as drones little more useful than monks. Further, a considerable number of hospitals for the sick or poor, mostly in the hands of the regular or Augustinian canons, which were dissolved as monasteries, were also wholly or in part converted into schools. (See *HOSPITAL SCHOOLS*.) Notable among these is the Mercers' School, London, that company having been granted the Hospital of St. Thomas the Martyr (Thomas à Becket) in London on condition of maintaining there a free grammar school for at least twenty-five boys. Further, diverse collegiate church schools were now handed over to lay government of town authorities or to church wardens, with augmented endowments, such as Warwick, Ottery St Mary's, and Crediton in Devon. Many more school foundations were in course of making or negotiation when Henry died, and some of these were carried out under his successor.

In the sphere of university education both Oxford and Cambridge benefited largely from the dissolution, the largest colleges in each being well endowed with monastic property. In regard to Christ Church, Oxford, indeed, the chief credit due to Henry is that he did not put into his pocket, as he was fully entitled to do, the property of the suppressed monasteries which Wolsey had given to Cardinal College, but gave it back to education, with very much less ecclesiastical appendages in the shape of canons and vicars choral than Wolsey had contemplated. Trinity College, Cambridge, founded by Henry in 1511 by the union of two existing colleges, Michael House and King's Hall, owed the bulk of its endowment, which has made it the greatest college in the world with its 800 students, to the dissolved monasteries.

Though Henry, like Luther, stopped short in his religious Reformation, it was owing to his strong will and determined action that the es-

sential steps were taken, the union of churches under a distant despotism broken, and the dead hand of monasticism removed from a third of the lands of England. If any of the reforming rulers is entitled to credit for educational foundations, it is Henry VIII, and not his son, Edward VI (*q.v.*). The bulk of the schools of England in quantity, if not in quality, were connected not with the cathedrals but with the collegiate churches, chantries, and gilds (*qq.v.*). Not less than 200 grammar schools and a larger number of song schools (*q.v.*) were so connected. An act of Parliament had been passed in December, 1545, or January, 1546, giving Henry power to suppress these clerical as he had already suppressed the monastic foundations. He died before he had time to enter on more than a score of them. One of the first acts in the new reign, commonly called the Chantries Act, vested all the endowments of these institutions in the Crown from Easter, 1548, with the express object of the "alteration, change, and amendment of the same and converting to good and godly uses, as in erecting of grammar schools, to the education of youth in virtue and godliness, the further augmenting of the universities, and better provision for the poor and needy." A commission was to be issued to ascertain what the property thus confiscated was, and they or two of them were empowered in every place, where by the foundation ordinance or first appointment a grammar school ought to have been kept, to assign lands of any such chantry for keeping of the school forever. This act purposed to do what Luther in Germany as a pious aspiration only wished, to apply a sufficient part of the funds of the dissolved foundations primarily to education. The Commission was appointed in February, 1548, and its returns were all in by May 31. These returns, known as the Chantry Certificates, are the main and in a number of cases the only source of our knowledge of the schools which existed in England before the Reformation. So completely extinct had this knowledge become before the publication of the educational items in these certificates in 1896, that the very existence of grammar schools before Edward VI was denied, and he was regarded as the founder of the institutions which his advisers set themselves to reform, and in too many cases only succeeded in disendowing and destroying. Foreign wars, domestic rebellion, political intrigue, resulting in an empty exchequer, were the causes which led to the failure of the act. The sale of the chantry lands was a pressing necessity to provide money. The reendowment of the schools was relegated to a commission of two, who were to cause proper "books," i.e. conveyances, to be made for the purpose. But "inasmuch as present order and direction" cannot be taken for them, "our pleasure is that so much money as here-

tofore hath yearly been employed toward the maintenance of any such schools shall be paid from Easter last" until "other order" can be taken. The commissioners, the chief of whom was Sir Walter Mildmay, who showed himself keen for education in himself founding a college at Cambridge in the days of Queen Elizabeth when he was Chancellor of the Exchequer, accordingly charged on the Crown revenues in each county a yearly stipend for the schoolmasters of the net amount he was found to have received from a dissolved college or chantry. But the sum was fixed. No allowance was made for payments for obits, offerings, or other ecclesiastical incidents, such as in the case of a collegiate church the holding of another chantry in addition to the regular stipend of the schoolmaster, which had added to the attractions of the office and of course ceased with the change in religion and the destruction of the collegiate churches. The sort of difference this made may be seen in the case of Southwell Minster, where the ancient stipend of the schoolmaster was £10 a year, but in 1504 he was given in addition the richest chantry in the Minster, worth £13 0s 8d a year, more than doubling his income. The effect of the Chantry Commission was to reduce his successor to £10 again. Nor was any allowance made for casual receipts from land, such as sales of timber or minerals, and the fines for renewals of leases, which formed the main source of income for other corporate bodies, or the raising of rents as the value of money fell. The kind of difference this made may be seen by the contrast between Borkhamsted School, which, founded only in 1545, had its lands restored to it, probably owing to their being claimed by the founder's heir against the Crown, by act of Parliament in 1519. The rental then was £30 13s. 4d. In 1813 the master had £5000 from fines and the income in 1877 was over £1200 a year. Where, as at Birmingham, the land given was or became urban, the "unearned increment" was much greater. Birmingham, deprived of the chantry grammar school at Doritend because no foundation deed could be produced to show that one of its priests was bound to keep a school, though he did actually do so, at a salary of £5 a year, acquired instead two thirds of the lands of the Holy Cross Guild, whether by purchase or gift is not clear, producing £25 a year. The earliest extant accounts of the school for the year 1655 show an income to £27 a year, which by the year 1907 exceeded £40,000 a year, out of which two high schools and seven grammar schools, containing over 1450 boys and over 1287 girls, were and are maintained. Contrast this with the neighboring grammar school of King's Norton, a much larger and better endowed school than Doritend at the time. It was continued by the Chantry Commission at the fixed salaries

then received of £15, £10 for master and £5 for usher, reduced by fees of the officials of the Crown to £13 0s. The result was that the school was at the time of the Schools Inquiry Commission in 1807 a sham grammar school in which three boys learned Latin and some forty the three R's. In the same county, at Rook, in which the "continued" endowment was £5 14s a year, the income was handed to the rector, who partly paid with it the master of an elementary school, supported by fees and government grant. Such was the fate of the schools existing when Edward VI came to the throne, in cases where later benefactors did not come to the rescue with further endowments.

The Commission signified to the commissioners that the king or his "dear uncle," the Protector, would at some later date signify "by word of writing" how many grammar schools there should be in each county and how much endowment assigned to each, by "further order." But the "word" was never written. In most of the schools the "further order" never came.

Organization of Schools.—When we examine their quality we find equally little novelty. One and all, the charters direct that in the assigned town there shall be a grammar school "to be called the Free Grammar School of King Edward the Sixth, to endure forever for the education, institution, and instruction of boys and youths in grammar, and we erect, create, and ordain, declare, and found by these presents that School to consist for ever of one master or pedagogue and one under-pedagogue or usher (*hypodidasculus*). In some cases, where the school was smaller, the usher was omitted. Not a word more is said as to the education to be given in them. It was assumed that every one knows what a grammar school education means, and there was no idea of introducing any changes in it. The governors were indeed in every case given power of making statutes for the direction of the masters with the consent of the bishop of the diocese, or, in cases like Sedburgh, where the school was connected with a college, of the college, and the curriculum could be laid down in these statutes. But it was apparently rather the exception than the rule for the statute-making power to be exercised at the time. The conduct of the school was left to the discretion of the master on the very sensible principle laid down by Collet in 1510, "what shall be taught of the masters and learned of the scholars it passeth my wit to devise and determine in particular." Even Henry VIII, with all his passion for minute legislation, had only laid down for his new cathedral schools that in the fourth form they should be practiced in poetic diction, the familiar letters of learned men, and the like; in the fifth form, in making Latin verses and the translation of the choicest poets and the best historians,

A GROUP OF REFORMATION EDUCATORS.

and in the sixth, or highest form, in Erasmus' *Copia*, varying of speech in every way, and digesting Horace, Cicero, and other authors of that kind. In fact, it would almost appear that the author of those statutes had before him the curricula of Winchester and Eton in 1530, sent for a model to the newly endowed Saffron Walden Grammar School, so exact is the correspondence. Clearly, neither the comparative reformers of Henry's time nor the radical reformers of Edward's reign conceived the need of reformation in religion as extending to the schools,—except indeed the song schools. These were regarded as nurseries of superstition, their main object being to teach a few boys "to help a priest to sing mass," and little more being taught in them than the bare learning by heart or being able to read without being able to construe or understand the musical parts of the services. "I learn to sing, I can but small grammar," as Chaucer's song-school boy says. As one great object of the Cranmer reformation was to make the services intelligible, they were to be for the most part read, not sung, and the need for choristers disappeared. So far as they were reading schools, no doubt, their place continued to be filled by the parish clerk till far into the seventeenth century, with the advantageous difference that they taught reading English intelligently instead of Latin unintelligibly. That this was now regarded as tending to reformation and free thought is clear from Bishop Gardiner's action during the reaction to Catholicism under Mary, in imprisoning Grafton for having printed the ABC (*q.v.*) in English, primarily for the benefit of the boys in Christ's Hospital (see *HOSPITAL SCHOOLS*). But English eventually became of universal use in the hornbooks (*q.v.*). Undoubtedly this was an immense advance in education and contributed to the demand which soon sprang up for learned works in the mother tongue. But it was a mischievous mistake to abolish the song schools instead of reforming them.

Universities — In the university sphere, Edward VI did little. The abolition of chantries in the colleges, setting free their endowments for general college purposes, gave the colleges a slight increase of income. A great law college was designed at each university. At Oxford it was proposed to effect this in a cheap way by transferring all the jurists or law fellows of New College to All Souls and all the artists and theologians of All Souls to New College. So at Cambridge there was a design to merge Trinity Hall, already and still to some extent a legal college, into Clare Hall, in a new "Edward College," with a master, twenty-three fellows, and twenty-eight scholars. This was frustrated by the opposition of Clare, the fellows of which were all theologians. An alternative plan apparently was to make a new college,

the master of which was to have annexed to his office the protonotaryship of the Court of Chancery and the vice-president and fellows, all doctors of law, to be masters in Chancery. But this too came to naught, as also did similarly projected colleges of medicine in each university. These colleges might have prevented the university declining as it did, at Oxford at least, into almost purely theological and grammar schools. As it was, the royal visitors, whose mission it was to establish these colleges, gave the universities statutes and injunctions, which left them much as they found them. The lecturer on philosophy was to supplement Aristotle with Plato, the mathematical to add Tonstall and Cardan to Euclid, Mela, and Ptolemy, and so on. Only one grammar school was to be allowed and that at Jesus College, Trinity College being made with much discontent to give up its schools. One notable change was ordered, in that the youth coming forth from grammar schools were to begin with mathematics. In this ordinance may perhaps be found the seed of the fame of Cambridge as a mathematical school. In all the faculties disputations were still to be held three days a week, one of which was Sunday.

It has been often represented that the Reformation caused the universities to decay. The evidence on the subject is complicated. *A priori* it might be supposed that the dissolution of monasteries and collegiate churches and the great diminution consequently in the demand for persons educated to fill them would have caused a great falling off in the numbers at the universities. But we now know that in point of fact very few of the monks ever had been at the university, and that though, as in the case of Prior Selling of Canterbury, the monasteries were sometimes recruited from the fellows of colleges, as a rule they were not, but from grammar school boys. These are oft quoted by Latimer and Lever in their sermons on the falling off in theological students. Lever asserts that there were 200 fewer in divinity than formerly, and 100 of "another sort." But they do not assert a general decline. Against them must be set their simultaneous complaint that "there be now none but rich mens' sons in colleges and their fathers look not to have them preachers." Haddon in 1547 asserts positively that Cambridge was never more prosperous or more numerous, though the "public schools" were so deserted that he had seen a professor lecturing to one pupil. He might have seen that any time in the last thirty years at Oxford, though there is not the smallest doubt that the students there were never more industrious or more numerous. The fact appears to be that the discrepancy of statement is due to the growth of the colleges at the expense of the university. The public lectures were deserted because of the great development of

college teaching, especially marked in the statutes of the new colleges of Corpus Christi and Cardinal (Christ Church), at Oxford, and of St. John's and Trinity, at Cambridge. The decline in the theological faculty was more than made up by the growth of the mathematical and law faculties. One main effect of the Reformation was to lessen and completely abolish the clerical civil servant. The offices of the Chancellor, the Treasurer, the Chancellor of the Exchequer, the Secretary of State, the Privy Seal, always formerly held by ecclesiastics, chiefly bishops, were now filled by laymen; and the subordinate officials underwent the same change. There was a great development in the civil service. Hence the decrease in the demand for clerics was more than counterbalanced by an increase in the demand for educated laymen, and without education even the greatest noble could not now expect office. So that while the aristocracy had always sent their younger sons to the universities to prepare for the good things of the Church, they now sent even their oldest sons there, to qualify for the good things of the State. It became the rule for the country gentleman to receive a public school and university education, often followed by a period at the Inns of Court (*q.v.*), too. The tendency which had already begun when Wykeham provided for ten *filii nobilitatis* as commoners with his seventy scholars, a number doubled by Henry VI at Eton and by Waynflete at Magdalen, was marked by an increase to fifty-four at Trinity College, Cambridge. In nearly all the colleges the numbers of commoners or pensioners began to outstrip the number of scholars. Perhaps the chief and most beneficial effect of the Reformation on education was therefore that while the universities still remained theological seminaries and the majority of scholars and fellows went into the Church, the clerical was so tempered and finally outnumbered by the lay element, that the education of the cleric was no longer purely professional, and while most laymen became more or less theologians, most theologians were laymen in education, and in social life.

Reign of Queen Mary — The reaction under Mary to a celibate clergy, to monks and friars, and the foreign ecclesiastical government, paid the Reformers the sincere flattery of imitation. Cardinal Pole imitated Wolsey in appropriating a clerical hospital to provide a boarding house for St. Peter's School at York, which, though it failed in its immediate object, still forms the main part of the school endowment. Westminster School remained untouched, though the secular chapter was created for restored monks, and a general decree provided that every cathedral church was to maintain a boarding school for sixty boys on the Winchester and Westminster model. The return to the Latin instead of the

English Primer, and the restoration of the old way of pronouncing Greek and Latin, marks the utmost extent of the reaction. Its chief effect was to convince the English nation of the danger of clerical statesmen and to make the Reformers who had fled to Switzerland return with far more radical ideas, evangelical instead of Lutheran, than when they left.

Elizabethan Period — Educationally the reign of Elizabeth may be divided into two great periods. In the first the effort was to return to the *status quo* of Edward VI's reign and to carry out what had been left unprovided in the re-endowment of the schools. In the second a new development took place towards English and elementary schools. The attribution to her reign of 103 new grammar schools and forty new nonclassical schools, besides twenty-seven and seven additionally endowed (see *ELIZABETHIAN PERIOD IN EDUCATION*), must be modified by an examination of the list of schools in *English Schools at the Reformation*. Of the list of 137 given by the Endowed Schools Commission in 1808, as founded by or under Elizabeth many will not bear examination. For it includes, for instance, the great public school of Westminster (*q.v.*), which in one sense was a foundation of Henry VIII's and in another of Edward III's time, and Hartlebury, the very first on the list, long previously existing; also Bangor, Worcester, Salisbury, Lincoln schools were connected with the cathedrals of the bishops there from time immemorial. Bridgwater, Bristol, Kingston, Abingdon, Darlington, Leicester, Evesham, Bromyard, Thelford, Richmond, St. Alban's, Burford, Horneastle, Coventry, Faversham, Colechester, Cheltenham, Topcliffe, Bungay, Normanton, Wakefield, Ashburton, Chesterfield, Hexham, Newcastle, Hedale, Bodmin, Fotheringhay, Leyland, Penryn, to name only a few, which have already been shown in print to be of foundation at various dates from the twelfth century downwards, were connected with hospitals, colleges, abbeys, chantries, guilds, and other local corporations. Indeed, the more local and public records are examined, the clearer it is that, in all but a very small minority of cases, the Elizabethan school charters merely confirmed or allowed the resuscitation or augmentation of ancient schools. Among the few really new foundations, and those founded by private individuals, were the two great public schools of Harrow and Rugby, founded, however, as purely local village grammar schools of a low grade, Ilighate and Blundell's School, Tiverton. Chief of all was Merchant Taylors in London, by far the largest school of its foundation up to that time, being for 250 boys, of whom 150 were not to be free scholars but to pay for their education, a most striking instance of the new importation of the civic laity at large into the sphere of education. There are perhaps seventy cases in which no evidence is yet forthcoming of

REFORMATION

pre-existing schools, but in most of these no expert examination has yet been bestowed on the school or other local records. The salient feature of the Elizabethan foundations or re-foundations after the first ten years is the extent to which they were due not to single founders but to joint effort of the lay inhabitants by subscriptions and donations and a sort of informal voluntary rate, as evidenced by the records which have been preserved in such places as Ashbourne, Derbyshire, Hulfax, Yorkshire, and St. Olave's School, Southwark. One result of this reliance on popular effort was the attempt to make the schools either only elementary schools or serving the double purpose of secondary and elementary schools by having an usher specially to teach the "petits," English, writing, and accounts. The attempt was not regarded with favor by the authorities, and it is noticeable how when St. Olave's, Southwark, obtained a charter in 1571 for a school which had been maintained as an elementary school since 1560, the charter provided for grammar, though by what is perhaps the first precedent it also provided instruction "in the accidence and other low books and in writing." At Wellingborough, where a grammar school had been maintained out of some gild lands, a suit in chancery resulted in a decree in 1599 authorizing two "distinct" schoolmasters on one foundation; one to teach Latin at 20 marks (£10 13s. 4d.), the other to teach to write, read, and east accounts at 20 nobles (£8 6s. 8d.), with the result of continual friction, the lower master, always the favorite with the town governors, constantly trespassing on the functions and scholars of the higher. The solution of establishing independent elementary schools for the poor and those who did not want Latin only began to be attempted in the last twenty years of Elizabeth's reign.

REFORMERS, EDUCATIONAL. — The term commonly applied to the group of educational innovators of the sixteenth and seventeenth centuries who broke away from traditional educational ideas and practice. The term is just as applicable to any educational innovator of any time. It was used by Von Raumer in the middle of the nineteenth century when he wrote the first adequate history of education, with a strong classical and conservative bias, and applied the term to the leaders in realism in education (*q v*). It was popularized in England by Quick (*q v*), who published in 1868 the most widely used English text in the history of education under the title *Educational Reformers*. For more detailed description of the work of the educational reformers, see COMENIUS, RATKE, FRANCKE, etc.

REGIOMONTANUS, JOHANNES (1430-1476). — The Latinized name of Johann Müller, a German astronomer and mathematician born at Königsberg in Franconia (whence he called himself Joannes de Monte Regio or de Regio Monte; also Kunlperger). At the age of twelve he entered the University of Leipzig and at fifteen became a pupil and friend of Georg Peurbach (1423-1461) at Vienna. Peurbach was invited to Rome by Cardinal Bessarion to prepare an edition of the *Almagest*, but died before he reached Italy. Regiomontanus, however, went to Rome and applied himself assiduously to the study of Greek and copied many Greek manuscripts on mathematics and other subjects. For some time he visited the chief cities of the North of Italy and lectured at Padua in 1464 on Alfraganus, preceded by a valuable introduction on the history of mathematics (the first of its kind). In 1468 he returned to Vienna, but soon left to accept the invitation of the king of Hungary, Matthias Corvinus, to take charge of his library and MSS at Ofen. In 1471 Regiomontanus settled at Nuremberg, where a wealthy citizen, Bernard Walther, became his pupil and patron, and provided him with an observatory, a laboratory, and a printing press from which many valuable mathematical and astronomical works of the ancient and medieval periods were published. In 1475 Regiomontanus was summoned by Pope Sixtus V to Rome to reform the calendar, but before he could proceed far with this work he died, of the plague or of poison, in 1476.

Most of the writings of Regiomontanus were left with Bernard Walther and were never published or were scattered. Much valuable material is also found in his correspondence. The works which were published are the following: the completion and edition of Peurbach's *Epitome in Cl. Ptolemai magnam Compositionem* (publ. 1406); an astrology containing astronomical tables and a table of natural tangents (publ. 1490); the *De Triangulis omnimodis*, a work on plane and spherical trigonometry, introducing the sine and cosine (publ. 1533); marginal notes to Adelhard's translation of Euclid; and a number of trigonometrical and astronomical tables (*Tabulae Directionum*, and *Tabula primi mobilis*). From the printing press at Nuremberg, Regiomontanus issued popular almanacs and the *Ephemerides*, containing astronomical information for a period of thirty years. While the originality of a great deal of Regiomontanus' works has now been disproved, his contributions in his particular field mark the point of transition from the medieval to the modern.

REID, THOMAS (1710-1706). — The founder of the Scottish school of philosophy, was professor of metaphysics at Aberdeen and then at Glasgow University. This school of thinkers labored to counteract the skepticism of Hume (*q.v.*) and the idealism of Berkeley (*q.v.*), both of which grew out of the representative theory of Descartes (*q.v.*), in which he maintained that what we perceive is not material objects, but their images. In opposition to this view, Reid taught that our perception of external things is immediate. His most distinctive contribution, however, was his *Doctrine of Common Sense*, which he expressed briefly as follows: "All knowledge and all science must be built upon principles that are self-evident, of such principles every man who has common sense is a competent judge. Such intuitive convictions, in both philosophy and ethics, are primary data of human thought." To this dictum Kant replied: "It is one of the subtle devices of our times to appeal to common sense when our knowledge gives out, and the shallowest fool confidently measures his strength with that of the profoundest thinker." Some confusion arose from the fact that in developing his philosophy Reid used the term common sense with two meanings: (1) the faculty of sound judgment, and (2) the sum-total of self-evident truths implanted in the minds of men. In the first sense of the term his argument was weak, but in the second (as set forth by Hamilton) it was strong. The teachings of Reid were developed and propagated by the other leaders of the Scottish school, Stewart, Brown, MacIntosh, and Hamilton. They established themselves in the Scotch universities and profoundly influenced British philosophy and ethics during the nineteenth century. The traditions of the Scottish school were perpetuated by Professors McCosh (*q.v.*) and Porter, and prevailed among the American colleges throughout this period almost as widely as in Great Britain.

RELIGION, PSYCHOLOGY OF. — The application of the methods of modern psychology to the phenomena of religion is a development of the last fifteen years. The subject is yet in its pioneer stage, but certain problems have been well defined and some specific results attained. The development of the psychology of religion thus far may be indicated conveniently in terms of these central problems, the methods employed in their study and the conclusions suggested.

The first subject investigated was conversion. Starbuck, in *The Psychology of Religion*; Coe, in *The Spiritual Life*; and James, in *The Varieties of Religious Experience*, dealt with this awakening of religious consciousness in the individual. Starbuck employed the method of the questionnaire, gathering from hundreds of people accounts of personal experience in reply to his list of questions. These records were classified, analyzed, and summarized by means of averages and percentages, with diagrams and interpretations. Professor Coe supplemented the questionnaire by the use of experimentation, particularly in reference to the influence of temperament in determining the conversion phenomena. Professor James introduced what may be called the literary and autobiographical method. He selected the accounts of striking phenomena from individuals very diverse in culture and temperament. In this way he enriched the material of the subject and suggested many new directions for further inquiry.

Certain results of this study of conversion and closely related topics have been well established. It has been shown conclusively that conversion is predominantly an adolescent phenomenon. The greatest number of conversions occur about the age of sixteen. The curve for these figures rises to the next highest points at twelve and eighteen. Starbuck emphasized the corresponding physiological and neurological developments in adolescence and also pointed out the close relation between the maturing of the sexual nature and the awakening of the religious life. He showed that conversion occurs at an earlier age by approximately two years in females as compared with males, and that their experience

RELIGION

is more emotional, more suggestible, and therefore more susceptible to revivalism. Coe confirmed these results and added important experiments with reference to differences in temperament. By the use of hypnotism and other means he was able to determine that persons who experienced hallucinations, visions, and motor automatisms in religion were subject or susceptible to them in other matters. All students of the subject agree that many persons do not, and are temperamentally not liable to, undergo conversion. They constitute the "once-born" type for whom religion, if it is experienced, is a gradual growth. Some authorities regard this as the more normal type and therefore emphasize this as the process of "salvation by education." The study of conversion naturally raises the question of the place of religion in childhood. The attitude of the child toward the doctrines and rites of religion is of the same character as his attitude toward other intellectual phases and practices of the adult world, — largely external and imitative, but genuine and real within those limitations. As the tendency among psychologists is to discard the notion of religious instincts, there is increased emphasis upon those forms of behavior, built up through association and habit, which are in accord with social customs and ideals. The different periods of childhood, as observed and described by genetic psychology, may therefore be taken as representing the possible stages and forms of the child's religious interest.

Another series of investigations has dealt with the origin and development of religion among primitive people. Here the methods of social psychology (*q.v.*) have been employed. The customs and ceremonials of the less developed tribes have been examined in relation to their moral and religious significance. The rich materials afforded by recent anthropological studies of native peoples give unprecedented opportunity for discovering their inner life. The study of their rites and observances has shown the close connection between these and their occupations and environment. The central interests of religion are the life processes by which individuals are preserved and the race maintained. Among pastoral peoples the flocks and herds are sacred. The first-born are regarded with special respect and are made the occasion of festive rites and honors. Seedtime and harvest are marked by ceremonials performed with some reference to the growth and preservation of the crops. Likewise drouth, pestilence, and other strange, irregular phenomena of nature occasion the performance of ceremonials. The crises of human life are also conspicuous. The events of birth, attaining manhood, marriage, sickness, death, and war are usually marked by tribal rites. The ceremonies are therefore concerned with

life and death issues. The various arts of music, decoration, dancing, and pantomime are organic parts of the dramatic representation. The myths and prayers are also integral factors and scarcely exist independently. These ceremonies are regarded as working magical effects. Such customs are fortified by numerous taboos—fears of penalties for neglecting or improperly performing the rites. Religion does not therefore appear among primitive races as something distinct from law, art, and morals. These are undifferentiated. Likewise, it is difficult to discover clearly discriminated notions of gods, spirits, and souls. The answers of savages concerning such matters are vague and inconsistent, probably not so much on account of reticence as because of the absence of clear ideas. They are dominated by habit and custom to a degree almost inconceivable by civilized man. The more fruitful studies of primitive religions are therefore those which deal with objective facts and emotional reactions rather than with a search for concepts and beliefs.

Several special problems have been investigated independently by the methods of individual and social psychology. Ritual, prayer, faith, belief, prophecy, speaking with tongues, mysticism, and other subjects have been treated. Certain general principles of modern psychology have been especially fruitful in these studies. The reaction from the older rational psychology is evident. It is found that many phenomena of religion are to be approached from the standpoint of instinctive and emotional reactions. Perhaps undue importance has been attached at times to the notion of the subconscious as a key to all these subjects, but when employed in the strictly psychological sense, it is a solving conception. It may be used as that form of experience illustrated by well-formed habits which require little conscious supervision. The individual person may be regarded as having different selves according to the different systems of habits which have grown up in his experience. These selves are at times in conflict, or one self appeals to another for aid, or one self seems to command and dominate another as if speaking or appearing in a vision from without. Such a view explains at once certain phenomena of prayer, prophecy, and mystical states.

Another important principle employed by several scholars in the interpretation of these experiences is the essentially social character of consciousness. Attitudes, habits, and forms of action are not original with a given individual nor are they peculiar to him. He gains the structure and content of his intellectual and spiritual world in large part from the social group with which he is most closely identified. Like his language, his view of the world is taken over from his social environment and becomes part of his living experience. The savage learns his language quite uncon-

sciously. He is able to use it, but he is not able to explain it or to interpret its structure. In the same way, his ceremonies and taboos have been wrought out in a vague and awe-inspiring past. "It is our custom," or "it was so in the days of our fathers," is a constant declaration of the social and corporate character of the sacred observances. In more developed stages, also, religion displays this social character. It emphasizes group authority, loyalty to common ideals, and gives its approvals and condemnations in the name of the whole people or body of believers. The mental processes of the individual bear the stamp of their social history. This inner thought is carried on in the form of conversation. His meditations and prayers to the deity are in the forms of social intercourse. Further, the ideals characteristic of the highest religions are the expressions of distinctly social sentiments or instincts, such as sympathy, love, and cooperation.

Certain problems are often identified more or less with religion, concerning which psychology has as yet obtained chiefly negative results. Such are spiritism, telepathy (q.v.), and other aspects of occultism. Concerning psychotherapy more definite and positive opinions are held by reputable psychologists, but these are not primarily matters of religion. E. S. A.

RELIGIOUS EDUCATION.—Education controlled by a religious conception of the aims of human life. In strictness the term implies a differentiation of educational thinking and practice that is distinctly modern. In the beginnings of culture, and for a long period thereafter, there was no conscious separation of religious from other social functions. Tribal consciousness included tribal religion; often national consciousness included national religion. What we now classify as religious ceremonies of early peoples were at the same time economic and political in character. (See Irving King, *The Development of Religion*. New York, 1910. Also E. S. Ames, *The Psychology of Religious Experience*. Boston, 1910.) Accordingly, it often happened that one and the same educational process inducted the youth into both sacred and secular functions. One condition for the differentiation of education into religious and secular is realized whenever an old religion breaks up, or divides, or even encounters strong opposition. Such a condition was present in Greece in the time of Socrates, it is reflected alike in the accusation against him, which combined religion and education, and in Plato's scheme for education that should be primarily political. (See GREECE, EDUCATION IN; SOCRATES; also PLATO.) The elements of the problem are present, indeed, in any period of especially progressive culture. For such progress means, as with Humanism, the self-assertion of some phase of culture on the basis merely of its own freshly experienced value. A contrast with religious education then arises on either of two grounds,—the conservatism of religious institutions and the consequent delay in assimilating the new culture, or the claim of such institutions to represent a supreme, inclusive, and authoritative rule of life.

It remained for the Reformation, however, to introduce a period in which the adjustment of religious and secular ideals is a fundamental and increasingly acute problem for the whole Western world. The Reformation is not to be thought of as chiefly a contest between two conceptions of the Christian religion. It was also and rather a stage in the splitting up of the medieval theocratic state into free religion and a free state. The significance of this political movement for education is profound. Shall the secular state control education which has heretofore been the prerogative of the church? If so, what shall be the content of instruction, and what the vital aim, of schools controlled by the civil power? In general the tendency has been first to reduce or remove ecclesiastical administration of schools, and then to reduce or even eliminate religious instruction. On the other hand, this has awakened in the churches a fresh consciousness of their own educational responsibility, and fresh zeal in devising means for supplying what the modern state does not provide.

The French Revolution conveniently marks the beginning of a struggle to give institutional expression to these divergent educational aims. A glance at the successive education laws of France, England, and the American States reveals an unambiguous tendency to discriminate educational aims more and more sharply, and to withdraw from religious instruction, leaving it more and more to the guidance and finally the support of voluntary religious organizations. (See ENGLAND, EDUCATION IN; FRANCE, EDUCATION IN; BIBLE IN THE SCHOOLS.) Before describing the response of the churches to this situation, it is necessary to specify more in detail the factors that enter into it. (1) The political factor, which has just been described as the breaking up of the medieval theocratic state, includes as one of its prominent features the growth of democracy. This is evidenced in education by the establishment during the nineteenth century of the principle of universal and even compulsory education provided by the state. This implies, at bottom, that education is no longer a boon granted to few or many, but a right, and further that the ideals that shall control it are to be simply the ideals of the people themselves. In principle, what could be farther from the presuppositions of medieval education? For the school is now no longer an instrument whereby an external authority imposes its ideas and ideals upon the people, but rather the consummate expression of the determination of the people to be self-ruled. (2) A second determining factor in the situation is the growth of modern science. Scientific method involves an effort to liberate inquiry from limitations imposed not only by ecclesiastical authority, but also by religious opinion, and even religious hopes and fears. What we now know as "knowledge" or "learning" asserts itself on its own ground, without reference to religion. The large place that it takes in education is therefore not only nonreligious; through this whole area modern education is inevitably antithetical to the "learning" that rested upon dogmatic authority. More than this, it is in contrast to the great basal processes of the mind included under such terms as instinct, emotion, faith, ideals, the "heart." The impersonality, the unemotionality of science fits it in a peculiar way to be material of instruction in the schools of a whole people, especially a people that is religiously disunited. Here, then, as in the political phase of this movement, a conscious differentiation of educational aims becomes inevitable. A simple illustration of the process may be seen in the development of higher education in the United States. Even in the colleges that are under denominational control, most of the organized, officially supported functions have shifted their aim, without any clear definition of policy, from religion to knowledge in the modern or scientific sense. But as a consequence there is now an awaken-

ing to the fact of this shifting of aim, and the religious spirit reasserts itself in a demand for specialized methods of religious instruction in these colleges. (3) Inextricably one with the political and the scientific phase of the public school movement is the industrial and economic phase. The age of factory production and mechanical transportation has multiplied occupations and enterprises in which success seems to depend upon mechanical rather than personal and moral forces. Whether one is actuated by economic pressure or by economic ambition, the result is the same; our economic order is not consciously moral as yet, much less religious. The education that it calls for aims to increase efficiency rather than to guide human powers toward any ideal goal. Possibly the movement for industrial, commercial, and technical training will ultimately uncover the spiritual factors in our vocations. Vocational training may yet assist in restoring unity to life. But certainly the first effect of industrialism upon education is just the contrary. Religion sees itself forced more and more to specialize its educational institutions and methods.

The fundamental fact, then, is that two types of social ideal are asserting themselves in education, and in increasing independence of each other. The effort to adjust the two has produced three rather distinct types of educational policy.

(1) The policy of Germany and England, which may be described as state support of religious instruction, but with recognition of sectarian differences. In Germany "religion" is universally included in the program of studies, but Protestant children are instructed in religion by Protestant teachers, Catholic children by Catholic teachers, and Jewish children by Jewish teachers. The English system is complicated by the necessity of adjustment between schools, on the one hand, wholly supported by taxation, and, on the other hand, denominational schools only partly supported thereby. It is further complicated by the fact that state support and control are partly local and partly centralized in the Parliament. The English government first took part in elementary education in 1833. From this time to 1870 its policy was simply to assist schools founded and controlled by voluntary societies or agencies. Religious instruction was given in these schools, but it was not supervised by the state. The education act of 1870 provided for the continuation of grants to such schools, but also for state schools properly so called. In the latter schools religious instruction is given as a matter of course, but no catechism or formula that is distinctive of any particular denomination is permitted to be used. (See COWPER-TEMPLE CLAUSES.) Further, the "conscience clause" permits any parent to withdraw his child from religious instruction. The education

act of 1902 further extends the patronage and control of the state in the voluntary or denominational schools, but it leaves the control of the religious instruction in these schools in the hands of denominational managers. The result is that the state now recognizes and supports two types of religious teaching, the one denominational, the other forbidden to be denominational. Mr. Burrell's unsuccessful education bill of 1906 proposed to put an end to the dual system of elementary schools by withdrawing all recognition and support from schools not provided by a local education authority. But the bill did not propose to do away with state support for religious or even sectarian instruction. (For a summary of English legislation on the subject of religious instruction, see Appendices I and II of *The Religious Question in Public Education* (London, 1911), by Athelstan Riley, Michael E. Sadler, and Cyril Jackson. This book also discusses a dozen different schemes for the settlement of the vexing question.)

(2) The policy of the United States of America. Education is here controlled by the different states rather than by the federal power, but a substantially uniform policy has been pursued. Religious instruction is wholly excluded from the public schools, but no obstacle is put in the way of schools wholly supported and controlled by religious bodies. Any private agency, secular or ecclesiastical, may establish schools attendance at which meets all the requirements of the compulsory attendance laws. The fruit of this policy is the existence side by side of many types of private school, with or without religious instruction. Toward all these schools the attitude of the public authorities is that, in general, of cooperation. The Catholics have established numerous parochial schools which teach the public school subjects and religion besides. From this quarter comes complaint that Catholics are taxed for the support of public schools to which their conscience does not permit them to send their children, and arguments have been made in favor of grants of public money to parochial schools as compensation for teaching the secular subjects. But the policy that is being steadily pursued by the states not only keeps hands off from religious instruction; it also refuses to enter into entangling partnerships with religious denominations. At one point religion still appears in most American schools, namely, the opening exercises of the day, which commonly include the reading of a passage from the Bible without note or comment, and often the Lord's Prayer. In a considerable minority of schools, however, no religious exercises are held, and in some they are forbidden by local authorities. (For full account of American conditions see *BIBLE IN THE SCHOOLS*.)

(3) The policy of France. Not only is complete separation of Church and State ac-

RELIGIOUS EDUCATION

complished by the Separation Law of 1905, but the Associations Law of 1904 suppresses all schools taught by members of religious orders. Thus the freedom of education that prevails in the United States, and that formerly prevailed in France, is now denied. But this does not prevent religious education given by churches over and above and apart from the day school. On this point the law explicitly protects religion from invasion by forbidding teachers to make objectionable references to any religious faith, and by providing that pupils may be excused from the public school on Thursdays in order to receive religious instruction from their respective churches.

Though it would be an exaggeration to say that stable equilibrium has been reached in either France or the United States, recent events indicate that the English policy and probably the German will have to be modified in one or other of these directions. For, even if a system of state education could successfully extend its wings over conflicting religions or sects, the capacity of the modern state to teach religion is denied not only by Catholics but also by Protestants. How, in short, can the secular state have any religious doctrines or standards? What shall be the religious qualifications of teachers of religion, and who shall test these qualifications? How much and what religion shall be taught by the state? Or, if the state merely patronizes the churches, shall it recognize Christian sects alone, or other religions also? If this policy is once entered upon, are there not qualitative differences among religions that the state is bound to take account of and discriminate between? As a matter of fact, opposition to the teaching of religion directly by the state arises from religionists themselves. It is a matter of common knowledge that German classes in "religion" are often formal, perfunctory, and anything but religious because the teacher lacks religious motive. In England there is opposition to undenominational religious teaching on the ground that, its content being determined by a process of elimination from actual faiths, the instruction is bound to be weak because of its generality, and because of its lack of attachment to any definite religious fellowship.

As the elimination of religious instruction from state schools places the whole burden of it upon voluntary religious organizations, so it places state schools under the necessity of reconstructing their plans for moral instruction and training. This reconstruction is now actively going forward, but it is still in an early, tentative stage. (See *MORAL EDUCATION*.) The character of the burden to be assumed by the churches depends upon their attitude toward the possibility of moral instruction and training that shall be free from religious control and yet not opposed to re-

RELIGIOUS EDUCATION

ligion. If an ecclesiastical body asserts that morals not specifically defined as religious are *ipso facto* antireligious, or if such a body claims for itself exclusive prerogative in the teaching of morals, the logical result is a second educational system, as in the Catholic parochial schools of the United States, which teach both religion and the secular branches. Where such exclusive prerogative is not asserted, there the religious schools, as Protestant and Jewish Sunday schools, leave the secular branches entirely to the state, reserving to themselves only such instruction and training as is religious in a specific sense. In this case religious education conceives itself as cooperating with state education as far as it goes, but as advancing the goal of life beyond the point at which the state must stop. It asks from the state efficient moral instruction and training, which shall be neither antireligious nor antiecclesiastical. The more general ideals of the state schools, as good citizenship, economic efficiency and prosperity, universal good will, and social progress, are always included within the hopes and aspirations of religion as it is known in the western world. A permanent working plan for coordinating secular and religious education is therefore possible wherever the state, though secular, refrains from teaching *secularism*, and leaves the churches free to teach religion in their own way.

The effect of the modern educational situation upon the churches is, on the whole, stimulating; it is at least awakening them to a definite consciousness of educational aims, and to search for correct methods. The doubt whether religion in this age of science and of social reconstruction is sufficiently sure of her own aims to know what she wishes to teach (see John Dewey, *Religion and Our Schools*, in *Harvard Journal*, July, 1908, pp. 790-809) is overbalanced on the one hand by considerations of historical continuity. Religion is a part of the cultural heritage of the race to which the child is entitled. (See Nicholas Murray Butler in *The Meaning of Education*, New York, 1908, Lecture I.) The new and untried scheme upon which we are entering is not religious education, but secular schools. Further, there are plentiful signs that the merely naturalistic interpretation of evolution, which would subject man to nature, has not convinced the age. (See J. H. Muirhead, *Religion a Necessary Constituent in all Education*, in *Harvard Journal*, January, 1908, pp. 343-358.) On the other hand, direct appreciation of the value of religion carries with it, in a large proportion of the population, readiness to assert the validity of religious education. Indeed, religious thought is focusing upon education as the central means of propagating religion, both within Christendom and in mission lands. (On the missionary aspect of the movement, see *Education in Relation to the Christianiza-*

tion of National Life The World Missionary Conference Reports (Edinburgh, 1910.) The organization of the Religious Education Association in 1903, and of the Catholic Educational Association in 1901 is symptomatic of a great awakening.

The growth of a distinctly educational consciousness within religion has been peculiarly rapid during the last two decades. Among the leading features of this growth may be mentioned—

(1) Investigations in the psychology of religion with especial reference to the religious growth of the individual. Typical of this phase of the movement is E. D. Starbuck's *Psychology of Religion* (London, 1899). (2) Efforts to bring instruction in the Bible into line with the assured results of historical and literary criticism. The extensive German literature of this subject is indicated in H. Meltzer's annotated *Verzeichnis empfehlenswerter Bücher und Lehrmittel*, 1 Heft. *Zum evangelischen Religionsunterricht* 2te Aufl. (Dresden, Beyer u. Kaemmerer, 1905). An English phase of the movement appears in T. Raymont's *The Use of the Bible in the Education of the Young* (London, 1911). On the movement in America, see references under "Bible" and "Biblical" in the Index to the Publications of the Religious Education Association, in the magazine *Religious Education*, Chicago, April, 1909, and A. J. W. Myers, *The Old Testament in the Sunday School* (New York, 1912). (3) An effort in England and America (most of all in America because of the absence of religious instruction in the state schools) to transform the Sunday school into a genuine school. Notable steps in this direction are the widespread adoption of graded curricula, and the beginning of systematic schemes for training Sunday-school teachers. (See SUNDAY SCHOOL.) (4) Numerous sporadic attempts at special religious teaching, as study courses in the young people's societies of the Protestant churches; courses conducted by Young Men's and Young Women's Christian Associations (*q. v.*), courses for the study of missions, and numerous schemes for the religious training of boys. (5) An effort to improve the teaching of religion in parochial schools. Graded lessons have been prepared, and the formal memorizing of a catechism is being softened by varied means of both impression and expression. See J. A. Burns, *The Catholic School System in the United States* (New York, 1908), and an address by Thomas E. Shields in the *Proceedings of the Catholic Educational Association*, 1908, pp. 199-223 (1651 Main Street, Columbus, Ohio) (See PAROCHIAL SCHOOL SYSTEMS; ROMAN CATHOLIC CHURCH AND EDUCATION.) (6) The organization or strengthening of departments of religious education in of Sunday schools in religious denominations, particularly several of the larger denominations in

the United States. See, for example, the two *Reports of the Joint Commission of the General Convention (Protestant Episcopal)* on Sunday-school Instruction, 1907 and 1910. (The 1907 report is printed by G. W. Jacobs, Philadelphia, and the 1910 report by F. H. Townsend, Providence.) (7) The introduction of religious education as a department of instruction in various theological seminaries, and a movement for requiring training in this subject as a qualification for entering the ministry. A considerable number of colleges have also begun to give instruction in this subject with a view, not only to the training of prospective ministers, but also to the preparation of laymen for skilled work in Sunday schools. On this whole movement consult the publications of the Religious Education Association, Chicago. (8) The output of an extraordinary number of books and articles that deal with both the theoretical and the practical aspects of religious education. If much of this material reveals how far religious education must be reconstructed and strengthened if it is to be placed upon a soundly scientific and professional basis, there is here abundant evidence that the work of such reconstruction is being attempted on a large scale.

Method of Instruction.—What, now, are the special problems of method involved in such a reconstruction of religious education? The assumption is often made that, as the principles of teaching are universal, the methods that now prevail in the state schools can be transferred to religion with only such modifications as are sometimes called "special method." It is certainly true that religious instruction is appropriating various features of professional educational practice. These appropriations may be summarized as follows: (1) Modified kindergarten methods with the youngest pupils. Such methods have been advocated for a generation or more, and during recent years they have been so rapidly introduced that they are now regarded as standard, at least in Protestant Sunday schools. This is to be accounted for in part by the religious quality of Froebel's thought, which has influenced the spirit of kindergartners generally. Of course the general lack of professionally trained kindergartners has made possible in most Sunday schools only a distant approach, though a real one, to kindergarten ideals. (2) Special methods of teaching in the grades, particularly methods for the self-expression of pupils. Picture pasting and picture drawing; the making of picture books; notebook work, sometimes illustrated and decorated, map making, both flat and relief, and the dramatization of Bible stories—these illustrate the general trend. Such methods are assumed and definitely planned for in the various systems of graded Sunday-school instruction. (3) Gradation of pupils and of instructional material and method, with

improvement in the structure of textbooks and plans of study. This phase of the reform is going on with great rapidity at the present moment.

These adaptations of methods current in state schools are highly significant. It is clear that both formal memoriter methods and hortatory methods are giving way to more intelligent processes. But religious education faces a deeper problem than appears in such adaptations of secular school methods. Shall religion be merely a "subject of instruction" in the same sense as arithmetic, grammar, or earth science? We must surely discriminate between religious education and instruction concerning religion. The aim of religious education is to produce religious men and women. To this end it must guide the growth of moral character, not merely inform the understanding. Besides "knowledge about" religion, there must be appreciation, feeling-attitude, personal ideals, active faith, and efficiency in transforming the world into a "Kingdom of God." Instruction has a necessary place here, but it gets its significance, and it must receive its control, from the larger aim to which it contributes.

The main problem of method, accordingly, concerns the guidance of such personal phases of a child's reactions as sentiments and purposes. It is not enough that the pupil should learn "the things that a Christian ought to know," or in addition become habituated to any given set of acts either of worship or of conduct. Within the Christian religion, at least, though not to the same extent in the non-Christian faiths, the "heart," which means both sentiment and will, is central. At this point the theory of religious education has much in common with the theory of public education. See MORAL EDUCATION; SUNDAY SCHOOLS.

Now, as the problems of practical life, as far as it is either moral or religious, are social in essence, the chief kind of experience that education has to promote in children is social experience. This does not exclude, but rather includes and subjects to a central principle, guided reactions of the pupil to the impersonal facts and forces of nature. Indeed, the power of impersonal nature to refine, console, and inspire appears itself to depend in major degree upon the attribution to it of something analogous to the companionship that we first know through intercourse with human beings. Because social experience is the material within which religious education works, the family has a position of supreme importance as an educational agency. Through experience of parental affection in regulated relations where love and law are one, the child first acquires ability to conceive and vitally respond to notions of divine love and divine law. The term "Father," by which the Christian reli-

gion expresses its thought of and feeling toward God, indicates the psychological basis for Christian education. Starting thus with the experience of social unity in the family, religious growth will naturally take two directions. (1) the religious interpretation and control of the enlarging and increasingly specialized social experience of a direct sort in school and community, and (2) the formation of religious attitudes toward the forces and processes of nature. This is to be accomplished by awakening sympathy for animal and vegetable life conceived under the forms of family experience, gratitude for the gifts of nature, and trust that raises awe and wonder to a social level. To reverse this order by attempting to deduce religious motives from acquaintance with natural facts as such would invert the order of experience of children reared in families, and it would seek to interpret and control the moral-religious life by that whose *prima facie* aspects are least moral and least personal. It follows that the primary educational function of a church is to enlarge the child's social experience in the direction of a present religious fellowship.

This social-experience conception of religious education determines the place and function of religious instruction. Clearly, instruction in religious history, literature, beliefs, and customs should be organized around the pupil's progressive participation in the life of the religious group to which he belongs. Here are to be found the interests that must control the gradation of material; here is found, too, the immediate function that instruction is to fulfill. It must first of all assist the child to a happy adjustment in his own present experience. Not that instruction merely shows what is to be done and how to do it; such narrowness would result in mere habituation, which is only a part of education. Instruction must be more free, more wealthy than this. Indeed, it can perform its primary function of assisting the child to successful adjustment in a present situation only by extending experience, through imagination, into the realm of free ideals. After imaginatively living through the experiences of other persons and other times, analyzing and judging the issues therein involved, the mind comes back to its own problems of present adjustment with fresh power of objective analysis and of appreciation.

Giving the primacy in religious education to active adjustment to the conditions of a present group, life is at once the most ancient and the most recent practice. It is new to us moderns because through most of Christian history a dogmatic-intellectualistic conception has dominated instruction. Neither the content nor the method was determined by analysis of the pupil's present interests and problems, or of his capacity for entering vitally into the activities of the religious communion.

RELIGIOUS EDUCATION

The fixed center about which instruction revolves is a body of logically connected propositions believed to have been committed by divine revelation to the Church, which is authoritatively to hand them down unchanged from generation to generation. This is the historically characteristic presupposition not only of Catholic but also of orthodox Protestant instruction. The presupposed formula has been, "First know, then do." The method appears in its quintessence when instruction is reduced to drilling into the pupil's memory the questions and answers of a catechism. The educational movement, however, among Catholics, Protestants, and Jews, alike, includes a striving after more vital methods. What ultimate relation this striving will have to dogma or to religious authority it is not the province of this article to determine. It is sufficient to point out the problem for religious instruction that is created by the science of education, and to indicate the educational trend within religious circles. We have already defined the problem, it now remains to state the trend. It has at least these features: (1) There is a growing realization that from the truth of dogmas it can by no means be inferred that a child can best be inducted into religion or even into dogma itself by first teaching him the contents of a dogmatic faith. The logical order is no longer assumed to be identical with the educational order. (2) There is increasing recognition of the value of free self-expression on the part of pupils. Provision for such expression is making its way not only on the grounds that general educational science has adduced, but also on grounds drawn from the nature of religion and from observation of the religious reactions of children. Wherever a necessity is felt for reconciling free self-expression with the authority of dogma, the mediating conception is that the same divine thought has been written in both the dogma and the developing needs of a human spirit. (3) Methods of instruction, and in important instances the content also, are being brought into close relation to the pupil's present religious activities. This applies not only to worship, but also to deeds of mercy and help, and to the everyday life of social groups like Sunday schools or Sunday-school classes. Further discussion of this point will be found in the article on SUNDAY SCHOOLS.

RELIGIOUS EDUCATION ASSOCIATION, THE — Organized at Chicago, Feb. 12, 1903, at a convention of over 400 persons from twenty-three states, two provinces of Canada, and four foreign countries, invited for this purpose by the Senate of the Council of Seventy (a society of biblical teachers). The purpose is "to promote religious and moral education." Membership is open to individuals and institutions without regard to religious affiliations. Investigation, discussion, and promotion of approved standards are carried on by the Council and the following departments: (1) Universities and Colleges, (2) Theological Seminaries, (3) Churches, (4) Pastors, (5) Sunday Schools, (6) Christian Associations, (7) Public Schools, (8) The Home, (9) Schools for Lay Workers. Annual conventions have been held in Chicago (twice), Philadelphia, Boston, Rochester, Washington, Nashville, Providence, St. Louis. The Association maintains a magazine, *Religious Education* (bimonthly), a free library of religious and moral education, a free bureau of information; and it holds numerous conferences. It cooperates with public educators without seeking to introduce religious instruction or worship into the public schools. The membership (1912) is 2036; the annual expenditure, provided by membership fees (\$3) and gifts, is \$13,860.02. The headquarters are at 332 So. Michigan Ave., Chicago, Ill.

RENAISSANCE AND EDUCATION — General Character of the Period and Its Educational Significance — The education of the modern world has its origins in the Renaissance. In this complex movement the revival of learning is the outstanding factor. That, however, was rendered possible by the conditions social, political, and economic of the countries in which it took its rise. As Italy had amongst the European communities attained the highest degree of development in political and social order, in commerce and wealth, in the arts and in the refinement of life, so it was the first to be conscious of the inadequacy of the medieval standards of culture to satisfy its growing needs. By the end of the *Trecento* the finer minds, in Northern Italy at least, were consciously working towards a new standard of knowledge and a wider outlook upon life. It was inevitable that such intellectual unrest should take the shape of a deeper concern for the great historical inheritance of the Italian people.

The Revival of Learning in Italy was in its origin due to a higher patriotism. Petrarch saw himself as the direct heir of the political and intellectual eminence of Imperial Rome. The early idealists of the Renaissance were concerned with the study of the antique as a step towards its reproduction in the modern world. Three great arts lent themselves readily to such revival, language, architecture, and education. Roman building and Roman speech had never ceased to remind Italy of a great past. The revival therefore began with them. But to fit the new generation to enter upon its restored inheritance it was necessary to frame a new education. It was inevitable that the model of such education should be borrowed from Roman antiquity.

The education of the modern world, therefore, took its rise in the determination of the Italian people to understand and to appropriate the spiritual inheritance of the ancient civilization. The instrument elaborated for this end was an education drawn from those same antique sources adjusted to the necessities of a Christian community. Medieval education was primarily technical, it was concerned with preparation for specific careers. The new education had for its aim preparation for life. Humanist and liberal education have ever since been convertible terms. The reconciliation of pagan and Christian ideals in education was in Italy at least reached without difficulty although not without controversy. (*Il Governo di Cura familiare*, of Dominici, 1405, is a most outspoken protest from the monastic side.) The great schoolmasters in practice found it easy to reach a compromise, just as at a later date did the Reformers and the Jesuits. It was characteristic of the best humanist education that it incorporated what was finest in the courtly

training of chivalry (e.g. Mantua under Vittorino and the ideal courtier of Castiglione), at the same time the new education was held to be a sound preparation for commerce and for public service.

Petrarch (*q.v.*), although the inspirer of humanism, has no direct connection with the new education. Florence, Padua, and Venice are the three centers in which the revival began to find expression in fresh ideals of instruction. Humanist enthusiasm was strong in Florence in the closing years of the *Trecento*, Niccolò the merchant (1363-1437), Salutati the administrator (1330-1406), and Ambrogio the churchman (1386-1435) stand for the different types of men drawn to the new ideal of learning. Chrysoloras (*q.v.*) was called from Constantinople to lecture at the studio of Florence in 1396, passing thence to Pavia in 1400. This was the first public teaching of Greek in Italy. From his visit may be dated that enthusiasm for the antique learning which peculiarly characterized Florentine society and that zeal for collecting manuscripts and works of classical art which was soon to render the city the first center of humanist study in the peninsula. At Padua, Vergerius was teaching from 1391. He learned Greek from Chrysoloras and popularized Quintilian (*q.v.*). In 1407 Gasparino Barzizza (*q.v.*) (*curus ductu et auspiciis Cicero amator et legittur*, says Guarino of him) took the chair of rhetoric where he read the *De Oratore* of Cicero for the first time in Italy. There were Greek schools in Venice. Guarino da Verona (*q.v.*) lived in Constantinople 1403 to 1408 in the house of Chrysoloras. In 1410 he taught Greek at Florence, and in 1412 was elected to the chair which Chrysoloras had vacated twelve years before. In 1414 he opened school at Venice, where he had for colleague a pupil of Barzizza, Vittorino da Feltre (*q.v.*). Meantime the new education had received an exceptional stimulus from the discovery by Poggio at St. Gallen of a complete Quintilian (1417). Five years later the entire text of the *De Oratore* came to light at Lodi. Guarino had already translated Plutarch's tract upon education (1411). In 1423 Aurispa returned from Greece with 238 Mss. Vergerius, perhaps the finest spirit of the early Renaissance, had (about 1402) issued the first sketch of humanist instruction adjusted to modern needs. Between 1420 and 1430 the material for a new educational apparatus was accumulating in the hands of scholars.

The impulse to the new education did not come from the ancient universities of Italy but from the courts and the municipalities. At best the great *Studia Generalia* tolerated representatives of the Revival as subsidiary teachers, for whom comparatively slender remuneration was provided. Bologna, like the University of Paris, lay entrenched within its impenetrable ramparts of vested interests.

The *Studio* at Florence was revived in the last decade of the *Trecento* expressly to further the new learning, there were, therefore, no traditional obstacles to overcome. Out of Guarino's court school at Ferrara developed (1412) the humanist university founded by Leonello d'Este. Pavia gave a welcome to Chrysolaus in the year 1400, but Piero Candido Decembri (c. 1440) held his public chair of Greek and Latin at Milan under the patronage of the Visconti. Venice erected Padua into a state university and encouraged the development there of humanist teaching. There was always a large cosmopolitan element amongst the students of Padua, which at the end of the century had become a prominent center of Greek studies in Italy. Marcus Musurus was Greek professor there from 1503 to 1511 when Erasmus attended his lectures. The chief distinction, however, of Padua lies in the place it occupies in the history of Latin scholarship in the period between 1510 and 1550 during which it was the seat of the high Cleronian cult. It was through the university of Padua that not a few British scholars derived their proficiency in the classical languages. The *Sapienza* in Rome came into prominence under Leo X who designed a Greek college which should make of the Italy City an international center of Greek learning. But at Rome humanism came to an end with the great sack of 1527.

Humanism. — The elaboration of the humanist curriculum in Italy was due primarily to two men, Vittorino da Feltria and Guarino da Verona (qqv). The school of Vittorino at Mantua (1423-1440) was perhaps the finest example of a great school of the humanities. The scope of his teaching was wider in some respects than that of Guarino at Ferrara (1420-1460). Both of them, like other Italian schoolmasters of the *Quattrocento*, regarded action as the end of education, and the classical authors were employed by them more from the point of view of training for practical life than as subjects of mental discipline or æsthetic satisfaction. The ethical purpose, therefore, was the dominant note in all instruction. This guided the choice of authors to be read, and the stress laid upon their respective values as instruments of teaching. Subjects which did not admit of direct application to life were of secondary interest to the humanist master. Hence mathematics and dialectic were of less importance than the rhetorical moralists, the didactic poets, and the historians. The natural sciences, the lore of animals and plants, as treating of matter vague and uncertain, were ignored except in so far as, like geography, they were necessary to an understanding of poets and historians. Moral teaching was imparted hardly less from the ancient literatures than from Christian doctrine.

The high place accorded to grammar is

explained by the fact that the term included not only accidence, syntax, and prosody, but the interpretation of authors. Coupled with rhetoric, therefore, which covered the higher forms of speech, letter writing, oratory, and verse composition, it connoted the full range of classical study up to the point where it impinged upon the knowledge of the philosophy and the law of the ancient world.

The New Curriculum. — The expression *Latere* is, in the mouth of the humanist, generally equivalent to Latin. Only in exceptional schools and with select pupils did it cover the teaching of Greek. Latin speech, in Italy obviously a less artificial exercise than elsewhere, was cultivated from earliest childhood. It was probably the usual medium of instruction. Grammar, in the narrower sense of the term, taught orally by dictation or learned from cribbed epitomes (e.g. *Regulae Grammaticae* or *Donatus Minor*) filled the first years of school. The poets Ovid, Terence, Vergil, provided the first material for reading and recitation. The Italian schoolboy gained marvellous facility in learning by heart. Public recitation by young pupils was insisted upon and great importance attached to enunciation and dramatic gesture in such exercises. It is to be noted that throughout the revival educators of all types, devout churchmen, rigid Lutherans, and common-sense Englishmen, agreed in affirming the peculiar merits of Terence as an instrument of Latin teaching. The poets to be read after Vergil are Lucan, Horace (*parum minor Vergilio*, according to Æneas Sylvius), Seneca, and Claudian.

The earliest prose writers read were Phædrus, Valerius Maximus, extracts from the *Letters* of Cicero, the *Catiline* of Sallust. But haste was made to attack the masters of oratory. The teacher could not go wrong amongst the speeches of Cicero, of which the four against Catiline were perhaps the most popular. Vittorino used the speeches in Livy. Vegio preferred those inserted in Sallust. At a later stage the *De Oratore* of Cicero and the *Institutio* of Quintilian were carefully studied. Lactantius, the Cicero of the Church, and Jerome were included by many earnest-minded schoolmasters. The reading of Cicero leads up to the practice of declamation as a fine art, and here again notice must be taken of the remarkable memory power shown in learning by heart oratorical prose. All humanists claimed a high place amongst liberal studies for history. Vergerius places it first. But one and all mean by history the literary presentation of the story of ancient Rome, and, to a much less degree, of that of ancient Greece. Nothing that followed the collapse of the Western Empire was worthy of study, nor was any history recognized as suitable apart from its fine literary style. Above all the biographical and ethical aspects of personality and of action constitute the true

attractiveness of history in education. Rulers and administrators will undoubtedly acquire wisdom from a study of the experience of the great epochs of Rome and Greece. The soldier may gain insight into the art of war by the study of great campaigns, but as might be expected the humanist had little interest in origins, and is destitute of apparatus of critical inquiry whether upon sources or the growth of institutions. Hence the pupil made his first acquaintance with history through Valerius Maximus, Roman stories from Livy, and, above all, from Plutarch, whose *Lives* were a favorite subject of translation with Latin scholars. Caesar was not regarded as suitable for beginners; Tacitus is never mentioned; Aeneas Sylvius would use the Old Testament and the Books of the Maccabees. History as a whole was regarded as an easy subject in which, as Bruni said, "there is nothing subtle or complex, for it consists in the narration of plain facts which are easily grasped." The same superficiality marks the humanist concept of philosophy. The scholar was instinctively averse to the characteristic learning of the Middle Ages. He refused to recognize the striving for an interpretation of the universe which inspired the great thinkers of the thirteenth and fourteenth centuries. The contempt which they expressed for all learning which did not rest upon the ancient literatures was seldom based upon knowledge. Philosophia to the humanist meant either mathematics (natural philosophy) to which they attached very moderate importance, — *de gustasse sat erit*, said Erasmus, — or the commonplaces of morals. Cicero and Seneca provided them with the necessary texts. Virtues and vices were treated solely as matters of personal conduct in its simplest form. They were barely concerned with the ultimate sanction of duty, or with the profound question which intimately affected them, of the opposition between Christian humility and the self-assertion of the man of the ancient world. The method of moral teaching was almost entirely literary and didactic. Plutarch and Livy provided an appropriate body of illustration. In practice, no doubt the best schoolmasters enforced moral teaching by the aid of religion, high example, and loftiness of personality. Public opinion regarded Greek as standing upon a wholly different footing educationally from Latin. The number of masters competent to teach the rudiments of the language was always small. Guarino, Aurispa, and Filelfo (*q.v.*) were the three scholars of Italian origin who had the advantage of learning Greek at first hand by traveling in the East. Vittorino began to study the language when he had well passed thirty, and though a most efficient teacher of what he knew he relied upon two native Greeks, Theodore Gaza (*q.v.*) and Georgios Trapezuntius, for the higher

work of his school. Grammars and texts were naturally difficult to provide. The *Protemata* of Chrysoloras and the much more complete grammar of Gaza were the only available manuals until the last quarter of the century. The Turkish conquest of the Eastern Empire drove numbers of Greek-speaking refugees to seek their fortune in Italy. Only few of them had any competence as teachers of ancient Greek. The two most profound intellects amongst the exiled Hellenists, Bessarion and Pletho, took no part in education. The more significant names amongst working scholars of Greek origin are, besides the three already mentioned, John and Constantino Lascaris (*q.v.*), Argyropoulos, Chalcondylas. The first and the last of these wrote manuals of grammar which were widely used in the West. Eribano Bolzani of Belluno (1443-1524) traveled for many years in the Greek East. He taught Leo X, as a boy, lectured in Venice, and after writing the best work in grammar of the Greek tongue, spent the ripe years of his life as one of the Greek readers to the press of Aldus Manutius. There is no doubt that both Vittorino and Guarino devoted much time to the teaching of Greek, though probably rather from the point of view of the content of Greek authors than from that of pure scholarship. In 1450 Battista Guarino (*q.v.*), son and later successor to Guarino Veronese, could affirm that without a knowledge of Greek no one was justified in calling himself educated. By the end of the century the high-water mark of interest in Greek studies had in Italy been already passed. The great work of interpreting ancient Greece to the modern world was destined to fall to France. Xenophon, Isocrates, and Plato, and above all Plutarch, were the favorite prose authors in Italian schools. Homer and Hesiod for obvious reasons were pre-eminent as poets. Demosthenes was curiously less popular in Italy than in humanist schools in Germany. Comparatively slight use was made of the great tragic poets. Thucydides was beyond the capacity of all but scholars of Greek origin. Manuscripts were extremely rare, and every prelection of an author was preceded of necessity by a careful dictation of the text by the reader. It must not be forgotten that Homer was not printed till 1482 or Thucydides before 1490; Aeschylus in a mutilated text did not appear till 1518. Such authors were printed in but small editions and were very costly. Regarding composition in Greek we have little evidence concerning school practice, but it was a not uncommon exercise to attempt a version of Latin into Greek oratory. Greek was considered a fitting subject of instruction for girls. Cecilia Gonzaga began it soon after Latin. It was debated whether it might not be learnt before Latin was systematically undertaken. Guarino declined to follow Quintilian in this ad-

vices, but he himself at Ferrara turned out pupils who after twelve months' instruction could translate competently from the *Iliad* and the easier prose writers. The humanists of the earlier time were expert teachers by oral methods. Such methods indeed were alone available. In the absence of texts written or printed, the pupil was required to learn both text and commentary by heart as they were dictated from the chair. There was probably more life and spontaneity, less rigor and precision, in the class work of Vittorino or the masters trained under him than was the case during the following four centuries. At hardly any time in the history of modern education has the personality of the teacher counted for so much in the technical work of instruction.

Latin composition, especially in the oratorical and epistolary forms, was the final test of efficient teaching. For both professional and social reasons fluency in Latin speech was highly prized. The Church, the law, medicine, the chancery, international intercourse, made demands which the humanist teachers did their best to satisfy. There was less pedantry of the Ciceronian type in the Latinity of the early revival than there was at Padua or Wittenberg in the following century. It was still possible to believe that Latin might become once more a living language in the practical sense, a language capable of enlargement and adaptation to current needs. Hence the indifference of the professed humanists to vernacular languages, which they, not unreasonably, criticized as unformed, variable, local, jejune in vocabulary, and lacking both in precision as instruments of thought and in elegance as means of literary expression. The dignity of the learned tongue was essential to whatever was worthy of preservation to future ages or had an interest wider than the bounds of nationality. The consciousness of possession of a language peculiar to the select and learned class lay at the root of the inordinate vanity which characterized many scholars of the smaller sort. But it is obvious that with the steady trend of taste and opinion towards the restoration of antique standards in outward life, in art, and in thought, a persistent desire to revive at the same time the antique instrument of expression was not in itself unnatural or pedantic.

General Interest in Education. — Viewed as a whole Italian humanism was fortunate in the man through whom its aims were translated into the forms of instruction needful to prepare a new generation for the vast and bewildering inheritance set before them. With few exceptions the finest minds of the age accepted their leading and sympathized with their ends. To prepare men for service in Church and in State was the highest purpose which the finer humanists set before themselves. In Italy respect for the body and its

training scarcely needed to be emphasized, and the contrast between the practice of Vittorino in this regard with that of the ordinary *Stadtschule* of Protestant Germany or of an English provincial town a century later is too striking to be overlooked.

Interest in education was by no means confined to men who were professionally occupied in scholarship and in teaching. Examples of this are most easily drawn from Florence. The bewildering genius of Leo Battista Alberti illuminated education as it did all the other arts. He deals with his subject in the well known dialogue, *La Cura della Famiglia*, in which training is handled from a specifically Florentine standpoint. Matteo Palmieri (1406-1475) was a typical representative of Florentine commerce. Trained under Marsuppini and Ambrogio, he was all his life long closely associated with such powerful families as the Guicciardini and the Capponi. For forty years he was immersed in the public business of his native city. About 1435 he put forth his dialogue, *La Vita Civile*, in which the theme is propounded. In what consist the virtues to be desired in the perfect citizen? In the whole range of pedagogical literature Elyot's *Book of the Governour* alone occupies the rational grounds taken by Palmieri in assessing the right educational ends for the modern state.

Educational Writings and Theories. — Other treatises upon the aim and practice of education which influenced the curriculum and organization of schools in Italy and beyond it may be mentioned; Leonardo Bruni (*q.v.*), *De Studiis et Literis* (c. 1429); Francesco Barbaro, *De Liberiorum Educatione* from his tract *De Re Uxoribus* (1428); Aeneas Sylvius (Pius II), *A Letter upon the Right Education of a Prince* (c. 1445), and his tract *De Liberiorum Educatione* (1450); Battista Guarino, *De Ordine Docendi et Studendi* (1450); Matteo Vegio, *De Educatione Liberiorum* (c. 1460); Jacopo Poreta, *De Generosa Liberiorum Educatione* (1470); Ivo wrote a letter to his wife on the upbringing of their children (*Del Governo della Famiglia Civile*); Patrizi wrote, before 1404, *De Institutione Republica* and *De Regno et Regis Institutione* with sections upon teaching. Manetti, Sacco Polentone, and Niccolò Perotti wrote similar tracts which are not now discoverable. Perotti was a great scholar, and, as a learned pupil of Vittorino's, his treatise would have been of much interest. Cardinal Jacopo Sadoleto (1477-1547) wrote *De Liberis recte instituendis*, three years after the sack of Rome. He had been a colleague of Battista Guarino at Ferrara and became, with Bembo (*q.v.*), Papal Secretary to Leo X on his election (1512).

Education of Girls and Women. — It has often been asserted that in the education of the Renaissance no distinction was drawn between the instruction provided for boys and girls, respectively. The practice of Vittorino

A GROUP OF RENAISSANCE EDUCATORS.

da Feltre might give color to this opinion Guarino had as pupils in the classical authors the two daughters of Nogarola, Isabella d'Este, the Duchess Elisabetta of Urbino, and Cassandra Fedele well illustrate the kind of higher culture deemed fitting for women of position. But here again qualification is needed. What was acceptable in Florence, Ferrara, or Urbino as regards the culture suitable to woman, was not accepted in Venice, or in Naples, still less in Palermo. The tract of Leonardo Bruni referred to above is concerned solely with woman's education. It is tentative, and the caution it displays shows that in the first decades of the Quattrocento humanists had to move slowly when the training of girls was concerned. Obviously the nature and extent of a girl's education depended upon the status accorded to women in society. Now only in certain cities, and in certain classes even in such cities, did public opinion admit women to equality of social intercourse with men. In Venice, for example, a woman was hardly seen in public except at church or at formal festivities. Her sphere of action was purely domestic. The standard of the Greek gymnasium commended itself to the patrician merchant rather than the freedom of intercourse which Florentine opinion permitted. Note should be taken of the ideal set out by Castiglione of the training and accomplishments suited to a lady of the Court.

Printing. — The establishment of the first printing press in Italy by two Germans from Mainz in 1465, when the first book printed in Italy was issued from the monastery at Subiaco, is a date of prime significance in the history of Italian education. The press was moved to Rome two years later. In 1469 John of Speier began to issue books from his press at Venice, which thereafter became the most important printing center for the production of the classics. Ferrara, Milan, and Florence had each their press at work in 1471. The cities named were the chief sources whence the stream of classical books spread over Italy and northern Europe. The first Greek book printed in Italy, the *Grammar* of Lascaris, appeared in 1476 at Milan. In 1490 Aldus Manutius framed his project for a Greek press at Venice. From 1493 onwards he issued that great series of Latin and Greek texts which in their smaller forms became models of current classical texts for European printers. It was not until the sixteenth century had dawned that the ancient authors were available to ordinary students. The *Academia* of Aldus at Venice, of which his press was in a sense a department, constituted a veritable university of classical learning to which scholars from all parts of the East and of the West were irresistibly drawn. As the sixteenth century advanced, the center of the printing industry passed northwards to Paris, Lyons, Basel, and Antwerp.

The Renaissance in North Europe — In the history of human development there is no such phenomenon as a civilization simply borrowed by one people from another. To absorb so complex a thing as an organized system of culture involves of necessity from the outset processes of selection, of adaptation, and of reshaping. When the Revival of Learning, therefore, passed the Alps to establish itself in Germany, France, or England, much more was in question than a mere change of habitat. Humanism in particular affected the Teutonic peoples in ways determined by facts of race and temperament, of history and of social and economic environment. Such variations in the mode of reception of the Italian Renaissance by northern peoples render the study of the spread of the New Learning and the education which was its product an attractive, though highly complex, inquiry. International trade and an universal Church, which alike had their center in Italy, had inevitably resulted in diffusing some knowledge of her new intellectual and artistic interests. Although ambitious scholars, mostly churchmen, were occasionally drawn thereby across the Alps in search of new opportunities of learning, it is in the main true that neither England nor Germany nor France at that time was competent to appreciate or profit by the progress which was characteristic of the Italian states. The contrast presented by the nations of central and western Europe on the one hand and the advanced Italian communities on the other may be realized by comparison of the English life, politics, and literary attainment in the period of the Wars of the Roses (c. 1455-1485) with those prevailing in contemporary Florence, under Piero and Lorenzo de' Medici, or with those which marked the zenith of Venetian prosperity and magnificence at the same epoch.

Teutonic Countries. — Nearly every German humanist when he looked back during the sixteenth century upon the beginnings of the new learning in his country, claimed as his forerunner Rudolph Agricola (q.v.). Educated at first in the north he studied at Paris, Pavia, and Ferrara, where he imbibed the finest spirit of the Renaissance. He returned to Germany with a desire to spread the great inheritance of antiquity and the new civilization to which it had given birth among his uncouth countrymen (*barbari, indocti, cluniques*, he calls them). Through Dalberg he was able to make Heidelberg a center of humanistic feeling.

It is impossible to lay down generalizations in exact and unqualified terms in treating of so complex a movement as that of the German Renaissance. But certain indications reveal themselves when we pass from a review of Italian humanism to examine the conditions of its development on German soil. The first is that the Revival of Learning in Teutonic lands could make no claim to form part of a

great patriotic reconstitution. Classical learning was of necessity a foreign product to the German race. It made, therefore, a different appeal from that which impressed the citizen of Florence or of Rome. The arguments to be put forward for the study of the ancient languages and for an education in which they were the dominant factors necessarily took different shape. It was not difficult to make a case for proficiency in Latin speech and writing in Italian lands, but contempt for the vernacular languages of Germany, France, or Britain was obviously sicer pedantry. The Renaissance, therefore, in northern countries partook little of the national character which belonged to it in Italy. We find Erasmus despising racial distinctions and claiming the New Learning as a potent weapon for destroying barriers of language, religion, and law and, possibly, even government due to instincts of nationality. A republic of learning indeed there might be, but scholars had quickly to realize that in presence of the primitive forces of humanity such a tie was but a feeble artifice.

In the next place the Teutonic stock was, by virtue of its racial type and of its history, more serious in temper, more alive to realities, less readily touched by sensuous emotion, possibly more religious by instinct, than the southern Latins. Humanism in Italy did little or nothing for the reformation of the Church or the permanent raising of moral standards. And thus, in spite of certain personalities amongst its adherents of outstanding integrity and devoutness. In Germany, in England, in the Low Countries, and in large parts of France the New Learning was speedily directed to spiritual and moral ends. The element of patriotic emotion, lacking in humanism *per se*, attached itself to the religious and ecclesiastical movement, which was in a very real sense humanism applied to the religious order.

Heidelberg was, after the death of Dalberg, unable to maintain to the full its promise of becoming the accepted seat of humanist studies on the middle Rhine, although Wimpfeling (*q.v.*) was Rector there in 1482 and Reuchlin (*q.v.*), whose Greek was good enough to command respect in Rome, was attached to the Court as Counsellor to the Electoral Prince. Before 1515 no other German university fared better in retaining as permanent teachers scholars capable of giving a new trend to the curriculum. As in Italy and France, therefore, the university in the main followed rather than led the humanist movement in its early stages. In all three countries the new learning took root in the Court and the school before it vitally affected the university.

It has been usual to regard the Brethren of the Common Life (*q.v.*) as the pioneers of humanism in the Netherlands and western Germany. Alexander Hegius of Deventer was not a member of this order, but his school of St. Lebuin was largely staffed by the

Brethren. He was personally favorable to a modified inclusion of classical authors within his school course, and, in particular, he responded to the influence exerted by Rudolph Agricola. Pupils of his, moreover, were powerful forces in preparing the way for a new education during the last decade of the fifteenth and the first two decades of the sixteenth centuries. On the other hand, certain schools under the Brethren were markedly medieval in spirit. At Liège they conducted a foundation which had great popularity, and, as regards organization, was the model of several important reformed schools in western Germany.

It is important to notice that humanism made its way into schools in Germany and the Low Countries by slow and halting steps. With the possible exception of the school at Alkmaar, where Murnellius (1513) was rector, it is impossible to point to a *Stadtschule* or *Domschule* which was avowedly and systematically organized on a humanist basis (*Poetenschule*). The new learning found its way usually into an existing school through an individual master, through a young rector, or again, through a Governor or patron who had imbibed a taste for letters on his travels in Italy. But with public opinion as yet indifferent, with the Church generally suspicious, with a scarcity of competent teachers, and above all with textbooks and methods of instruction of the traditional type, it was at this early stage well-nigh impossible to recast a school upon avowedly humanist lines. Before 1520, at least, no attempt was made to found a new school, whether under religious, secular, or princely control, which should express the full ideal of classical learning after the fashion which became common in the following decade.

One of the most important figures in the early history of the German Revival is Jacob Wimpfeling of Schlettstadt in Alsace (1460-1528), a priest of distinction who approached the task of improving schools primarily as a step towards raising the status and learning of the clergy. He had a remarkable knowledge of Latin authors, although he was ignorant of Greek. He was a student and teacher at Heidelberg (Rector, 1482), where he no doubt knew Agricola. In 1497, whilst at Speyer, he published his first educational tract, *Isidoreus Germanicus*. It is a tentative effort towards establishing a humanist curriculum in which, like most early German scholars of the German Revival, he retains the *Doctrinale* of Alexander de Villa Dei (*q.v.*) as the foundation of grammatical teaching, but associates with it one or other of the little manuals of Barzizza, Christian Latinists, such as Augustine and Prudentius, are intermingled with Augustan writers as texts for study. But though Wimpfeling speaks with something less than the serene conviction of Agricola, he ranks next to him as the stimulating force on behalf of

humanist study in southwestern Germany. In his *Germania* (1501) he urged the City Council of Strassburg to undertake the foundation of a high school in which the New Learning should have substantial recognition. This appeal was the first step towards the erection of that great school of which Sturm (*q.v.*) was, at a later date, to be the Head Master.

Basel represented the interests of learning in western Switzerland. The house of Froben, the printer, was a center of scholarly society. Schools in which newer methods of instruction were current came into existence between 1500 and 1510. Pirkheimer's influence was probably responsible for tentative steps in the direction of humanist teaching in Nuremberg, where as early as 1485 manuals of Barzizza and epistles of Aeneas Sylvius are found side by side with medieval textbooks in the *Spital-schule*. Munich, Ingolstadt, and Regensburg, amongst Bavarian schools, possessed before 1520 occasional masters who endeavored to bring into use humanist methods of instruction. The same is true of Breslau and Goldberg in Silesia.

Rudolph von Langen (1458-1519), who had been a pupil of Hegius at Deventer, spent four years in Italy. As Dean of the cathedral of Münster and Governor of its school, he reorganized the instruction so far as he was able upon humanist lines (1500). Murmelius was appointed by him as assistant master, and with the sympathies of Langen was successful in reconstituting both the curriculum and the intellectual temper of the entire school. In 1513 he became Rector of the school at Alkmaar, which became a center of humanist education for northern Germany. Murmelius was a prolific writer of textbooks, the *Pappae Puerorum* (1515) was one of the most popular manuals of grammar throughout the next half century; *Scoparius* (1517) was an effective protest against the grammar and logic of the medieval stamp. Emmerich followed in the steps of Münster and Alkmaar. In Cologne, however, under the influence of the university the New Learning found no welcome in the schools.

In central Germany Erfurt was distinguished for its keen intellectual sympathies. Eobanus Hessus (*q.v.*) was master there in 1507, he became presently the head of one of the principal groups of German humanists and enjoyed the intimacy and profound respect of Erasmus. At Freiberg in Saxony, Mosellanus (*q.v.*), a scholar of the first rank, was teaching school in 1515. The *Stadtschule* of Zwickau enjoyed for many years a high reputation and had strong humanist leanings. Under Natter (1523) an imposing scheme for a comprehensive classical curriculum was framed, but had little success when put into operation.

Turning to the universities, the career of Petrus Luder, born about 1415, is instructive in respect of their early relations to the New

Learning. He spent some years in Italy before the year 1456, when he returned to Heidelberg, where he delivered a remarkable public lecture in praise of the new studies which is believed to be the first humanist appeal made from an academic chair in Germany. Meeting with little response, he passed first to Erfurt, then to Leipzig, spending one year in each, and afterwards to Basel. What is known of him recalls to us the career and temper of Agricola. Keltis or Celtis (1459-1508) is a humanist of a type we are familiar with in Italy, where he had imbibed, as foreigners often did, some of the worst elements of the scholar-adventurer. He lectured at Heidelberg, at Ingolstadt (1490), and at Vienna from 1497 until his death. Through the connections of the Imperial city with Italy, Vienna had been early touched with the spirit of the New Learning. In the year 1493 a standing lectureship on Poetry, that is, Roman literature, was set up. The *Bucolics* and *Aeneid* of Vergil were in 1494 prescribed to be read for the degree of Bachelor in Arts. A *Collegium Poetarum* was erected within the university in 1501. But, like similar efforts, it was premature, and four years later had barely a dozen pupils. The first chair in Greek was established there in 1523.

At Cracow as early as 1480-1490 university lectures in the classics can be traced. Keltis appeared on the scene in 1480, but further progress in humanism was suspended, owing to political troubles, until the marriage of King Sigismund with Dona Sforza renewed the Court interest in the New Learning.

German humanism in its formative stage owed most to the universities of Tübingen, Erfurt, Wittenberg, and Leipzig. At Tübingen, Melancthon (*q.v.*) spent six years (1512-1518) in continuous and profitable study. He was enabled to make himself competent in the text of Vergil, Terence, Cicero, and Livy, and acquired a sound knowledge of Homer and of Demosthenes. He read also Poliziano and other Italian humanist writers. The Greek text of Aristotle was his chief interest, and he found time for mathematics, astronomy, and even for a study of the *Pantheists*. Erfurt (where the first book in Greek type printed in Germany appeared in 1501) was the home of the group which produced the *Epistolae Obscurorum Virorum* (*q.v.*). The dominant figure in its society was Mutianus Rufus, a canon of Gotha, whose correspondence ranks perhaps second only to that of Erasmus in the light which it throws upon the community of learning of the age. Making Reuchlin, Hebraist and Grecian, their hero, the Erfurt humanists engaged in strenuous warfare against the medieval disciplines. Their reckless self-confidence dismayed Erasmus, whose suspicions of the tendencies of Mutianus and his friends were justified in the event, for one and all became militant Reformers under

Luther and Melancthon. During the first two decades of the sixteenth century the Electors of Saxony led the way in the courtly patronage of letters. Duke George invited various scholars to Leipzig. Aesticampanus (1507) read most of the Latin authors there, including Tacitus. Crocus (1515) and Mosellanus (*q.v.*) held in succession the chair of Greek. The university underwent organic reform in the direction of the subordination of the medieval disciplines to the faculty of letters in the year 1519. Wittenberg at the same period could claim the first rank amongst the humanist universities of Germany. The Electoral Prince in 1518 invited Reuchlin, the *doyen* of German scholars, to find for him a young scholar willing to teach Greek in that university. Melancthon was promptly appointed to the chair amid the approval of all competent critics. His inaugural address was a manifesto on behalf of university reform throughout the Fatherland. The *Institutiones Grammaticae Graecae*, which he issued in the same year, marked an epoch in classical study. Two years later Melancthon was lecturing upon Greek authors to five hundred pupils. The influence which Luther exercised upon the young scholar was to intensify the patriotic fervor which colored Melancthon's humanism. That combination of classical enthusiasm with a keen sense of nationality was his qualification for that task which shortly awaited him of organizing afresh the higher education of the German people. Melancthon supplied to the German Renaissance that which neither Erasmus nor Reuchlin could give; namely, a great constructive capacity. In conjunction with Luther (whose *Appeal for Christian Schools* (1524) to the Burgomasters of Germany was in strict accord with Melancthon's ideas), he found himself in a position to revolutionize method and instruction in every important town and university where the Reformation held sway. The universities specially affected by his activities were Wittenberg, Tübingen, Marburg, and Königsberg. The great school of Nuremberg organized under his scheme was opened in 1526 by Melancthon himself amid the enthusiasm of the citizens, who already saw in their city a new Florence. But the *Obere Schule* proved a failure, typical in this respect of not a few imposing foundations in the cities of central and western Europe. For a rigidly classical education covering the life of a boy up to the verge of manhood was found to be in practice an unsuitable training for the son of the average burgher destined for an industrial career. The commerce of the world rested upon vernaculars and not upon elegant Latin. Business aptitudes continued, therefore, to be sought in schools of a different type, or, still more, through experience in office and shop, or in foreign travel. There was undoubtedly a large and steady demand in Teutonic coun-

tries for the higher humanist education, but, as the great school of Sturm at Strassburg showed, four careers were in the main open to youth who could complete a full course in letters, — the Protestant ministry, the law, the civil service, and the profession of teacher.

Other schoolmasters who carried forward the work of higher education in Protestant Germany may be represented by the names of Sturm (*q.v.*), Rector at Strassburg from 1530 to 1589, Trotzenhof (*q.v.*), the distinguished Rector of the school at Goldberg (1524), Neander (*q.v.*), the Rector of Ilfeld (1550), and Wolf, the Rector of Augsburg (1557). The first of these built up his school squarely upon the basis of Melancthon's principles, i.e. its aim was purely humanist in the sense that it prepared its pupils to enter upon the higher study of letters or theology, or law, at one or other of the universities, but gave no technical or professional training within the school course. The religious basis was strongly defined. Like Luther, Trotzenhof attached importance to training in music. The curriculum of Neander was marked by its unusual width. A pupil at Ilfeld might study not only the "histories of all ages," but also the principles of medicine and an interesting range of *Rechen*. Wolf was remarkable for the elaborate subdivisions which he introduced in the organization of his classes. He adopted textbooks of French origin, such as Crenand's *Greek Grammar*, abandoning those of Italian scholars as superseded. He revived the practice of disputation (*q.v.*), delivered to his senior pupils public lectures on advanced subjects drawn from history and philosophy, and (differing herein from Sturm) regarded language, whether Greek or Latin, primarily as the means rather than the end of instruction. In the school of Wolf, German humanism as an instrument of education reached perhaps its finest development.

Educational Literature — The following is a list of certain representative treatises upon education written by German humanists during the period of the Revival of Learning: Rudolph Agricola, *De Formando Studio* (1481); Wimpfeling, *Isidoreus Germanicus* (1497); Murnellius, *Scoparius* (1517); Melancthon, *De Convocandis Adolescentium Studios* (1518); Sturm, *De Literarum Ludis recte aperendis*, (1538); *Nobilitas Literata* (1530); *De Educatione Principis* (1551); Nansen, *De Puero Literis Instituendo*, Camerarius, *De Ludiis Potioribus*.

The Low Countries — It is unnecessary to draw a sharp geographical distinction between the Low Countries and the Rhinelands of Germany in estimating the influence of the humanist revival. Agricola, Hegius, and Erasmus belong by origin to the former region, but their activities were felt far beyond the country of their birth. So, too, the schools of the Brethren of the Common Life, although founded by a Dutchman, and, in the main,

carried on in the Low Countries, had at least as much effect in Germany as in the Netherlands and the Burgundian March. The position of Erasmus (1406-1536) in the world of letters, in so far as it is concerned with humanism and education, is separately treated elsewhere. There is nothing in this significant figure of the Northern Renaissance specially characteristic of the country of his birth; indeed, he expressly disclaims for himself the label of nationality, the barriers of which are in his view one of the chief obstacles to universal peace and the spread of a common learning.

The special service which Erasmus rendered to the cause of humanism in the Low Countries was the share that he took in carrying out the purpose of his friend Jerome Busleiden (1470-1516) to found under his will the *Collegium Trilingue* at Louvain. Busleiden, a friend of Thomas More, had studied Greek at Bologna and Padua before, as canon of Malines, he made that city a meeting point of scholars for western Europe. For fifteen years he was the acknowledged head of humanism in his native country. Louvain at the beginning of the century was more rigidly attached to the medieval disciplines than Cologne itself, partly owing to the strength of vested interests amongst its governing body. Busleiden as a humanist of the finer type was in touch with the progress of the New Learning in every center in which it had taken root. Like Erasmus, he represents the international character of the great *Respublica Litterarum*. Hence the new foundation of Colet and of Christ's College, Cambridge, the *Utopia* of Sir Thomas More (1516), stirrings of the new spirit in Wittenberg, Heidelberg, Tübingen, Münster and elsewhere, were so many stimuli to him to devote his wealth to the same cause of learning. Erasmus, although much pressed, was not to be induced to fetter his liberty by the acceptance of the chair of Greek in the new college which by Busleiden's will was set up alongside of the university of Louvain. Adrian Barlandus was the first professor of Latin, Rutger Rescius of Greek, Campensis of Hebrew. Barlandus was a master of spoken Latin and wrote a volume of dialogues which had great vogue in schools. The *Collegium* illustrates the tendency of scholars outside Italy to rank Hebrew with the classical tongues. Cleward, an official teacher of Greek at Louvain, published in 1530 his *Institutiones Græcæ*, the most popular Greek grammar in Europe. But he was also the best Arabic scholar in the West and traveled to Africa to perfect his knowledge. Erasmus' connection with Louvain was strengthened by the intimate relations which he contracted with the great humanist printer and publisher, Thierry Martens, from whose press poured in vast quantities schoolbooks and classical texts which were used in all Western schools, rivaled in this respect by that of Paffraet at Deventer.

Nowhere did the Reformation conflict more violently than at Louvain. Erasmus, who made it his home for three or four years between 1518 and 1522, declined to take sides in the quarrel and sought refuge in Basel, and afterwards at Freiburg, returning to the Swiss city shortly before his death (1536).

The Spanish scholar Vives (*q.v.*) was a member of Erasmus' circle in Louvain, where he lectured in both Greek and Latin at the university. He was not affected by the new movement in religion, and his Spanish nationality made him *persona grata* in high society in a country then part of the dominion of the king of Spain. He was called to England by Wolsey (1522), where he enjoyed the patronage of Queen Catherine and lectured at Corpus, Oxford. The latter years of his life were spent at Bruges writing and teaching, and he was much in request as adviser upon learning and schools. The Spanish Netherlands was henceforward identified with the Catholic party and in consequence lost the place hitherto belonging to it in the comity of learning in northern Europe. Many years later the standard of Protestant humanism was firmly planted in the Dutch provinces in the newly founded University of Leyden (*q.v.*), which was for two hundred years the chief center of erudition for Protestant Europe.

France. — The proximity of France to Savoy and to Burgundy, not less than the intimate commercial relations which connected the French lands with Upper Italy, and the further kinship of race and language, rendered the valleys of the Rhone and the Loire more accessible to the spirit of the Revival than those of the Rhine and the Danube. Lyons and Orleans revealed humanist sympathies long before these touched Paris or Toulouse, where the universities held sullenly aloof from a movement which threatened the vested interests of theology, philosophy, and canon law. Stray scholars, like Balbus and Beroaldus (1476-1485), found their way to Paris, but received scant welcome. In reality the Renaissance reached France in the train of the retreating armies of Charles VIII and Louis XII. The campaign of Naples (1494-1495) was in truth an origination moment of first importance in the history of the French spirit. The Revival of Letters in France owed to the circumstances of its origin, in part at least, its characteristic association with the court and chateau. Neither Church nor university had a perceptible share in its first stages. The French court at Milan (1498-1512) was the principal channel through which a restless current of Italian influences poured into France, bearing with it new standards of taste in building, in art, and, above all, in letters. Thus in France as in England humanism looked to the person of the sovereign, the powerful noble, or the great lady for encouragement and material aid in the

war against the strongholds of obscurantism. The accession of Francis I (1515) was, like that of Leo X, of Henry VIII, and of Charles V, hailed as the beginning of a new age. The young King was quick, receptive, and had a fine taste; he was ambitious of distinction, and from the outset identified himself with the newborn aspiration for broader intellectual and artistic interests. Guillaume Budé (*q.v.*), the most promising scholar in France, was welcomed at the Court and made royal librarian (1522). Humanists were made secretaries and ambassadors. Erasmus wrote to congratulate his French friends on the prospect before them. Manuscripts and books were diligently collected, the Royal Press set up (1526), and a new *Collège de France* planned on humanist lines and on an imposing scale. When Budé died, in 1540, a modest beginning had been made in the erection of four chairs, those of Latin, Greek, Hebrew, and mathematics.

The religious conflict had hampered the cause of learning in France, as elsewhere. The universities in the main held by the old order. Humanism was by them identified, not unfairly, with reform. The next impulse to education came from the great civic corporations in the provinces rather than from the capital. This movement was general throughout France before 1550. The work of the corporation of Bordeaux in the foundation and conduct of the *Collège de Guyenne* in that city is the best representative of a large number of similar experiments. The University of Bordeaux was also governed by the city magistracy. In 1531 this body applied to André Gouven, a Portuguese scholar, then teaching in the University of Paris, to reorganize the town school on new lines. He brought with him competent Latin teachers from Paris, including Mathurin Cordier (*q.v.*). Under the guidance of a succession of able rectors supported by a broad-minded governing body—Montaigne (*q.v.*) was mayor in 1580—the college attracted a strong teaching staff, amongst whom were several Scotsmen of note, a Balfour who became Rector, and George Buchanan (*q.v.*). Bordeaux was inclined to neutrality in religion. Gouven would recognize no difference between Catholic and Reformed amongst the pupils. But very early in its history the governors found themselves bound to conform. Cordier, a convinced follower of Calvin, who had to flee from Paris for refuge to Geneva, joined him there, occupying himself for nearly thirty years in teaching (he was head of the school at Neuchâtel) or in reforming and organizing schools in the Protestant interest. Calvin, as part of his religious activities, governed and controlled the *Collège de la Rive* (1559), the great humanist public school of Geneva, which was a model to other foundations in Huguenot towns. Calvin, however, regarded

the college as a seminary for the ministry. It kept up a high standard. Greek was begun at the tenth year of age.

Cordier before he left Bordeaux fixed the methods of organization and instruction for the lower forms of the school upon lines which were not varied for a century. Gouven was a distinguished rector, energetic, liberal, devoted to his work. *Primus inter pares*, he says of himself in relation to his staff. An assistantship under him was a coveted post, for initiative and originality were certain of recognition. Vinet, his successor, reduced the method and practice of Gouven to the shape of a written program, which ranks with the most interesting educational documents of French humanism. The program covers both organization (ten forms, followed by two one-year courses in the faculty of arts in the university), methods of instruction, which are worked out in detail for each class, and include disputations, mutual correction, modes of preparation, and the like; and the curriculum, in which Greek takes a place much below that occupied by the same subject in an Elizabethan school of the period. The Latin grammar prescribed was that of Despreux, as edited by Erasmus, Gaza being set for Greek. It must be admitted that the details recorded of the method of instruction devised for the junior classes impress the present-day reader with a sense of the dullness and laboriousness of the work required. The later history of the college was marked by periods of controversy and depression. The high-water mark of its prosperity was reached between 1550 and 1570, in spite of a threatened cleavage on religious grounds. In 1572 the Jesuits set up a rival college in the city, but this was suppressed under Henri IV, and its revenues fell in part to the *Collège de Guyenne*. The Edict of Nantes (1598) confirmed and extended to the nation that spirit of sincere tolerance which had marked the Bordeaux school since its inception. The wealthy and progressive city of Lyons was in the sixteenth century the natural meeting point of French and Italian culture and commerce and their chief center.

The religious cleavage became definite in 1535. Persecution of Protestant scholars originated in part from the universities. Humanists had sympathized with reform mainly on score of its claim for freedom and its resistance to the authority of traditional learning. But persecution inevitably drove the Huguenots to adopt a new attitude. The rigorously logical mind of Calvin evolved a counter-creed. But scholars drawn to religious revolt in search of a reasonable faith and gentle tolerance, not incompatible with historical continuity, were instantly repelled by a new and unlovely dogmatism. Most of the French scholars declared for the old order. A few, like Étienne Dolet (*q.v.*), a thoroughgoing skeptic, went

to the stake. Others endeavored to avoid a perilous declaration of opinion.

Robert Estienne and his son Henri were the first learned printers of Europe, at once scholars and craftsmen. As such they rendered inestimable services to learning. The *Linguae Latinae Thesaurus* of the older Estienne, in its edition of 1543, was a monumental dictionary which served as the basis of every great lexicon until the present generation. The Greek *Thesaurus* of his son (1572) was an even greater achievement. The firm was forced to quit Paris for Geneva in 1551, owing to persecution by the Sorbonne. Both father and son thereupon avowed their adhesion to the Reform. It is important to note that Henri Estienne was deeply interested in the right development of the French vocabulary by direct grafting from Greek and Latin. His treatise *La Conformité du langage français avec le Grec* (1565) and his *Dialogues*, in which he satisfies the efforts of the "Italianizers," illustrate the relation of humanism and learning to the vernacular. In this connection, also, the subtle effect of the great activity of translators from Greek and Latin into French in fixing syntactical usage and elaborating sentence forms demands careful attention. The debt due from French and English speech to the scholarly versions from the three ancient tongues is significant of one of the functions which the school study of classics performs for the youth of to-day.

Joseph Scaliger (1540-1609), a pupil of the *Collège de Guyenne*, learned no Greek until he sat under Tannobus at Paris (1559). These two men, with Casaubon (*q.v.*), represent the transfer of supremacy in Greek learning to France. To Scaliger the Italians of the time appeared as pedants, without thoroughness or initiative. Like the Estiennes, he passed for a time to Geneva. His greatest work, which stands outside the range of pure scholarship, was *De emendatione temporum* (1583), a marvelous attempt to determine the chronology of the ancient world. He was called to Leyden in 1603, bringing to it much renown. Fiercely calumniated by the Jesuits, he died in 1609.

In Rabelais and Montaigne (*qq.v.*) we see humanists of another type. Both look upon learning and education as men of the world, both denounce pedantry in all its forms, both are genially tolerant towards everything but intolerance. Rabelais, doubtless, had little but negative influence upon education, for his so-called "realism" was too superficial to form a guide to school practice. Montaigne, on the other hand, stands for the ideal of the scholar-gentleman, who knows the world and moves easily amongst unfamiliar environments. He is the Western equivalent of Castiglione's *Courtier*, adapted to a society which occupies a wider stage. Hence his *Essays* (1570-1580) are amongst the enduring monuments of the

humanist spirit. With the issue of the Jesuit *Ratio Studiorum* in its final form (1599) the history of education enters upon a new era.

Spain. — The Spanish Peninsula, in spite of the intimate political and personal relations of the Valencian kingdom with the courts of the Borgia popes and the royal family of Naples, received little impress from the Italian Revival. An occasional traveler carried back a text of Cicero or Quintilian; Salamanca in Arias Barbosa had a pupil of Poliziano as private teacher of Greek rudiments. But the temper of Spanish Catholicism was very serious and never favored "pagan" studies, whilst political and racial struggles hindered learning of all kinds. Antonio de Lebrija (1444-1522), near Cadiz (Nebrassensis) was the first scholar to bring home from Italy an active enthusiasm in the cause of letters. He taught at Salamanca, lecturing on Pomponius Mela and on the Christian Latinists, and also at Alcalá. He published a Latin grammar (1492) and, later, elementary manuals of Greek and Hebrew. The first Latin classic printed in Spain was Sallust (1475). The grammar of Chrysoloras appeared at Madrid, in the finest Greek type ever used in Europe, in 1512. The New Testament in Greek was finished in 1514. Ximenes (1437-1517), Cardinal and statesman, was a firm friend of humanists and made his new college at Alcalá a center of classical learning. Vives was educated at the ancient school of Valencia founded by Jaime I, which was in succession *schola*, *studium*, *gymnasium*, and *academia*, but always essentially medieval in its disciplines, even after its reorganization in 1490. We hear of no humanist school for boys in the Peninsula before those of the Jesuits.

The University of Alcalá attracted both Greek and Hebrew scholars. A Cretan, Demetrios Doucas, taught Greek. Its pupils included Vergara, Alfonso de Nebrija, and Lorenzo Balbo. Erasmus was the rallying name for scholars devoted to the New Learning, and around this hero-worship fierce controversy arose. After the great Italian settlement of 1530, which deeply affected Spain, clerical authority was strong enough to hold humanism "suspect"; scholars began to quit the country. Pedro Nuñez Vela taught at Lausanne, others went to Wittenberg, or to Sturm at Strassburg, where they professed the Reform. The College at Alcalá was in fact a seed bed of "heretics." We hear of scholars in service of Charles V, such as Morillon, a competent Greek, Buchanan (1544) and Clenard (1532) went to Spain and Portugal, carrying with them possibilities of a new education which fell inert. Until the Jesuits established their influence as the educators of Catholic youth, the classical spirit made no headway in Spanish schools.

Great Britain — The Revival of Learning in Britain dates from the early years of the

fifteenth century, when English ecclesiastics first came into contact with humanist secretaries of the Roman Curia, such as Poggio, Bruni, and Alberti. Poggio himself visited Britain in 1419, to his great discomfort. William Gray went from Balliol to Ferrara to study under Guarino, and returned (1449) with a fine collection of manuscripts, which now rests in the library of his college. The library of Duke Humphrey dates from the same period and was destined to form the nucleus of Bodley's Library. Other scholars such as Selling, mostly churchmen from Oxford, found their way to Italy from time to time during the Wars of the Roses. Italian teachers also began to appear in the same university as peace and order were restored, and endeavored to find pupils in classical Latin, and, possibly, in Greek. Caxton set up his press in 1477.

The death of Richard III marks the close of half a century of unrest and the opening of a new era. In that year (1485) Lanaerc (*q.v.*) went to Italy to bring back with him not only a sound knowledge of Greek, but a first-hand acquaintance with Aristotle. Another son of Oxford, Grocyne (*q.v.*), after a sojourn in Italian cities, stood up to read Greek in Oxford in 1491. Although he met with slight response, his friend Colet (*q.v.*), returning five years later, drew large audiences to his lectures on Pauline divinity interpreted directly from the texts. It was on Colet's invitation that Erasmus came from Paris in 1499 to spend three months at Oxford, returning for a second visit six years later. Neither university at the beginning of the sixteenth century made official provision for humanist teaching. If given at all, it was a personal and private venture. The first English center of the New Learning was in reality the house of Sir Thomas More (*q.v.*), in Chelsea, where met in 1505 Erasmus, Lanaerc, Warham, Colet, Fisher, Grocyne, Elyot (*q.v.*), and others—the small group that represented the spirit of humanism in England.

John Colet, on the advice of Erasmus, refounded in 1509 the cathedral school of St. Paul's, on humanist lines indeed, but with a special stress laid upon Christian discipline. St. Paul's is chiefly significant from the fact that its statutes were widely adopted in other foundations, e.g. Manchester School and Merchant Taylors', especially in respect of its lay control. Erasmus busied himself in finding masters (William Lily, *q.v.*), and compiling textbooks for the school. The accession of Henry VIII in the year of Colet's foundation was heralded as an event of auspicious omen for the New Learning in England. Erasmus hastened back from Rome in the summer of 1509 to find that nothing very striking was likely to happen. But two years afterwards a lectureship in Greek was created for him at Cambridge, which was his home for four years. It was due to his influence that the first avowedly humanist college in the English univer-

sities was founded by his friend and patron, Chancellor Fisher. Christ's College at Cambridge had its counterpart at Oxford in Bishop Fox's foundation of Corpus Christi (1517); in the following year Wolsey set up classical lectureships, and planned his great Cardinal College in the same university. Five years later Luis Vives, one of the finest Latinists in Europe, with a genius for teaching methods and a man of earnest religious temper, was called to lecture in the newly founded College of Bishop Fox.

Meantime the work of Erasmus had borne fruit in other directions. His leisure at Cambridge enabled him to prepare and translate the Greek text of the New Testament, which Froben printed for him at Basel in 1516, along with his edition of Gaza's *Greek Grammar*, which became thereby the standard Greek manual until displaced by those of Melancthon and Genard. Sir Thomas Elyot, who as a boy had been brought up in the atmosphere of humanism through frequenting the circle gathered round More, was in a broad sense the true interpreter of Erasmus to England in so far at least as concerned the aims and the instruments of education. *The Governour* (1531) is the finest exposition of the meaning of humanism for the citizen of a modern state produced by the Revival of Learning in Western Europe. Elyot hits the exact truth when he urges that the new political order requires qualified instruments for its administration, and that a trained governing class must henceforth take the place of the privileged caste and the clerk educated under the medieval disciplines. Elyot's *Governour* is the English parallel to Palmieri's *La Vita Civile*, which he knew well.

In spite of religious turmoil which began to vitiate all departments of English life, the New Learning made steady, indeed rapid, progress in English society. In the universities the cause of humanism in the face of fierce opposition was making ground. The foundation of Trinity College, Cambridge, and of the Regius professorships in Civil Law, Hebrew, and Greek (1510) set the seal upon the transition from the medieval to the modern disciplines. Richard Croke, who had taught rudiments at Leipzig, and Thomas Smith had held in succession the Readership in Greek since 1510. John Cheke (*q.v.*) was the first Regius Professor in that language. With Roger Ascham (*q.v.*), Smith, and Cheke in important teaching posts, Cambridge on the eve of the Reformation led the way in English scholarship. Few things in the history of English learning are more difficult than an accurate comprehension of the effects of the Protestant and Roman Catholic administrations of the universities which filled the twenty years preceding the accession of Elizabeth. That political and religious unrest are unfa-

voidable to learning is a law which applied to England in the fifteenth and sixteenth centuries, as elsewhere. Certain facts cannot be overlooked. It was a gain to England that under the Edwardian régime foreign scholars like Bucer were appointed to teach in England. Probably there was advantage to English scholarship in the enforced residence of Protestant ministers and teachers in continental seats of learning in the succeeding reign. On the other hand, humanism became tinged with sectarianism; colleges were partisan societies; at Oxford Magdalen was Protestant and New College Catholic, and there were purgings of one and the other according to political circumstances; medieval books were ruthlessly destroyed by Edwardian visitors at Oxford, where about 1550 a whole library could be bought as waste paper for forty shillings. More serious facts were that matriculations fell off, that graduation was a comparatively rare thing, and that most degrees were taken *in absentia* during the three years ending with 1550.

Yet new colleges and schools continued to be founded: St. John's, humanist but Catholic, and Trinity at Oxford, and Gonville at Cambridge, refounded (1558) by Dr. Caius (*q.v.*), the most distinguished man of science in England, Catholic and humanist. Under Queen Elizabeth national self-confidence returned. The Court from the Queen downwards was imbued with the spirit of the New Learning. Cecil and Leicester were made Chancellors of the two universities, which by degrees became seminaries for the production of a "due supply of fit persons to serve God in Church and State" rather than of scholars of high rank in the comity of learning or theologians of profundity. Their influence upon English society became steadily more marked, and as a result the shrewd advisers of Elizabeth felt it necessary to keep a firm control over their political and religious tendencies. After 1575 political conditions required the exclusion of the Catholic element from English education. Hence the rise of English colleges at Douai and at Rome, following upon the rigorous imposition of tests upon all concerned with instruction. Puritan families mainly affected Cambridge, especially St. John's and the new College of Emmanuel, the avowed center of militant Protestantism, from which so many of the Nonconformist bodies drew their ministers. It was from Emmanuel that John Harvard (*q.v.*) took his degree.

Oxford logic remained strictly Aristotelian; Cambridge, as St. Andrews (*q.v.*), taught it on the lines of Agricola and Peter Ramus (*q.v.*). Greek at both universities steadily declined during the century. Whitgift, the most powerful man of his day at Cambridge, knew no Greek. The Chancellor, Leicester, complained in 1582 that Greek was seldom or never read by its professor at Oxford. No single work in

classical scholarship was produced in England which can be compared with that of a hundred industrious classicists in France and Germany. The translators, of whom there were many, unless it were Savile (*q.v.*), worked invariably from a Latin or a French version in handling a Greek author. A few men of multifarious learning like Henry Savile serve to remind us of the broader type of humanism, which was much more common in Italy and France than in Germany or England.

The universities of Edinburgh (1582), Trinity College, Dublin (1591), Glasgow and St. Andrews, were by the end of the century marked by the humanistic spirit. But theology and politics had almost extinguished university teaching in Scotland, whence we find students of Scottish origin scattered throughout seats of learning in Western Europe. George Buchanan, more at home at Bordeaux than at Glasgow, was a classical scholar of the first rank. Gresham College (1596) in London was an attempt to adapt the wider knowledge of the day to the commercial needs of the new time. (See GRESHAM, SIR THOMAS)

Turning from universities to schools, the latter were of two types, the great public boarding school drawing pupils from the country at large, of which Eton, Winchester, Westminster, and Shrewsbury were the chief, and the town day school, whether new or reformed, such as St. Paul's, Merchant Taylors' (1561), St. Saviour's, Southwark, Tonbridge, and Magdalen College School. The statutes of Wykeham or of Collet were the usual model for a new foundation. Headmasters were rarely men whose scholarship was worthy to rank with that of the great rectors of German or Swiss schools. In the public boarding schools just mentioned, Greek was uniformly taught, though Westminster and Shrewsbury aimed at a higher standard than the rest. Isocrates, Demosthenes, and Homer were taught at one or the other. Clenard's grammar was used until the Eton Greek grammar, based upon that of Giant, began to take shape at the end of the century. In Latin Lily's manual — which became the Eton Latin Grammar — was the dominant textbook throughout the century in both types of school. Much use was made of *Colloques* (*q.v.*), especially those of Erasmus, Cordier, and Vives. Sturm's *Letters of Cicero* and, though rarely, the *Elégantiae* of Valla were prescribed. Terence, as usual, was the most popular author. Sallust and Livy came before Caesar. Composition in prose and verse was the end and purpose of Latin reading. Declamations, essays, and Latin plays were weekly exercises. English writing probably was more cared for than would be inferred from the absence of any reference to it. History and geography signified the history and geography of the ancient world. There is no evidence that either of

there was taught on systematic lines. We hear much less of Plutarch in English than in Italian schools. Natural history consisted of uncritical illustrations of the allusions in the classic poets to natural phenomena. Mathematics were gradually eliminated from the curriculum of English grammar schools as they were from the courses in arts in the universities. Much attention was given to singing, whilst writing and ciphering were relegated to inferior schools which confined their teaching to the vernacular. English editors and printers contributed little to the supply of school texts, which were, until the seventeenth century, almost entirely provided by the presses of Plantin and Gryphius, of Stephanus, Martens, and Aldus. It is a significant fact that neither at Oxford nor at Cambridge was the printing press at work between 1530 and 1582. After 1580 license to publish was the privilege of the Archbishop of Canterbury and the Bishop of London. Outside the capital, Oxford and Cambridge alone had authorized printers. (See articles on the separate Public Schools of Eton, Harrow, etc., Fees; Free Schools; Grammar School; London Schools, etc.)

Certain books call to be mentioned here as concerned with the matter and method of instruction. *The Arte of Rhetorique* by Thomas Wilson (1553), friend and disciple of Croke, well repays a reading inasmuch as he treats rhetoric from the point of view of English and does not overlook its application to teaching. It contains moreover some thoroughly sound criticism of classical writers and is generally far more solid and practical than similar productions of Italian and French origin. *The Scholemaster* of Roger Ascham (1570) is an appeal for consideration of the defects which he perceives in the humanist education of his time. He writes as a sincere Protestant with a strong national instinct. If young men must travel let them go to Strassburg or Frankfurt, not to Italy.

Richard Mulcaster (*q.v.*) wrote two works, *The Positions* and *The Elementarie* (1581-1582), which are the product of his experience as a city schoolmaster. Three points principally demand attention: his advocacy of the training of teachers, his recognition that rigidly humanist instruction is not the preparation which an industrial community demands, and the claim he puts forward for vernacular teaching. The influence of *Il Cortegiano*, as translated by Hoby (1581), in developing an English code of manners is elsewhere dealt with. *The Queene Elizabethes Academy* of Sir Humphrey Gilbert (1572) presents a scheme of training in which languages, both modern and ancient, mathematics, and law are grouped with technical and military exercises to form an education more in touch than stereotyped humanistic instruction with actual life. It is an anticipation of Milton's

generous dream. The works just mentioned along with *The Governour* of Sir Thomas Elyot are one and all marked by a note of reality and of breadth of conception which distinguish them favorably both from the more pedantic tracts of similar purpose of German origin and much of the conventional rhetoric of some Italian writers on educational doctrine.

RENDU, AMBROISE-MARIE-MCDESTÉ (1778-1860).—French educator. Although practically admitted to the École Polytechnique, he was forced to withdraw on account of his refusal to take the oath against the royal family that was required by the Directory. He was thus cut off from academic honors. Fontanes, with whom he early came into contact, was his warm friend and was responsible for his appointment general inspector under the new Imperial University. From this time on he was ardently devoted to the cause of popular education, and no little credit for the establishment of the first primary normal school in France (Strasbourg, 1811) is due to him. In fact there was hardly a phase of public education in which he was not vitally interested.

RENNES, UNIVERSITY OF

and whose conditions he did not strive to ameliorate. He was particularly devoted to the cause of instruction for the working classes, to the extension of the system of primary normal schools, and to the organization of a system of real inspection. Classes for adults, teachers' conferences, schools for girls, and the improvement of teachers' salaries, at one time or another occupied his attention. Throughout it all he was a redoubtable champion of the authority of the state in educational affairs. For nearly fifty years he devoted his life to the educational service of the state as member of the imperial and royal councils of public education, and during this time numerous works issued from his pen. Among the more important of these may be noted: *Quelques observations sur l'ordonnance royale de 1815; Essai sur l'instruction publique et particulièrement sur l'instruction primaire; L'Université de France et sa juridiction disciplinaire, Considérations sur les écoles normales* (1850), *Code universitaire*.

RENNES, UNIVERSITY OF, FRANCE. —

A university organized at the time of the general reconstruction of education under Napoleon 1806-1808. The only faculty for many years was that of law. In 1834 a faculty of letters was added, followed two years later by a faculty of science. Medical instruction had been given at Rennes since 1800, when a *Société libre d'Instruction médicale* was established to replace the old colleges of physicians and surgeons which had been suppressed in 1792. In 1820 this school was attached to the University and in 1896 obtained its present title as *École de plein Exercice de Médecine et de Pharmacie*. The enrollment in the University in 1910-1911 was 1673. The *École de plein Exercice de Médecine et de Pharmacie* at Nantes (c. 1460) is generally regarded as a branch of the Academy of Rennes. Its enrollment in 1911 was 347.

RESEARCH, ENDOWMENT OF —

Scientific research as contrasted with the formal study of organized knowledge is a product of the Renaissance spirit and intellectual interests. This new interest first found organization in the early scientific academies and societies, and here even yet it finds its chief home. With the endowment of these academies and the gifts to them of special funds began the history of endowed research; and such institutions of all countries at the present time provide for research in its widest and most varied forms and render it stable and effective. In fact the encouragement of research is the chief function of such scientific societies. This aspect of the subject is treated under Academies and Scientific Societies. Related to the research work of scientific societies is that done by archeological societies. (See ARCHEOLOGY.)

The second most important form of endowed research, and in Germany from the beginning and the United States at the present time by far more important than the first, is the provision for research by university endowments. This is usually done by means of fellowships or scholarships, and this phase of the subject is treated under these captions as well as in the section on research in the article on American Universities. Fellowships and scholarships do not necessarily indicate an interest in research, as is true with the historical fellowships of the older English universities. In general, in American and English universities the greater part of the research work done is for the purpose of training students. German universities, however, look upon the advancement of the bounds of knowledge through the research work of their professors as one of their chief functions, if not the chief. American and English universities in recent times have come to emphasize this part of their function. The research professor, made from the English university fellow, is rare. During the last few years,

however, some gifts of large funds have been made to American universities for research purposes. Most of these, however, as with the Crocker gift for investigation of cancer, have been for purposes connected with medical education.

During the past century, however, the endowment of research on a new basis has developed. With the rise of the modern scientific spirit, and with the discoveries and inventions of the nineteenth century, the unwisdom and loss in leaving to chance or to subsidiary efforts of men primarily engaged in other matters the exploration and development of new fields of science and social relations, became clearer and clearer to the minds of many benevolent men of wealth. Whole communities or governments also became convinced of the need of promoting systematic and prolonged research. The result is the multiplication of endowments and subventions for this purpose in nearly all of the great nations of the Occident. Many of these endowments are permanent and of royal magnificence, others are in the nature of endowments for a limited period, or for work upon a particular problem whose solution, or whose limitations, at least, are to be determined. Of the latter sort is the gift of \$1,000,000 to the Rockefeller Commission for eradication of the hookworm, the sum to be spread over a period of five years. The Crocker endowment for cancer research stipulates that the income may be used for other researches if a method of preventing or successfully treating cancer should be discovered.

It should be noted that certain objections urged against earlier endowments (see *Endowments, Truancy* or) lose much of their cogency when raised against endowment for research, experimentation, and prolonged observation. Whereas the motive of the earlier givers was usually to educate the youth, to comfort or heal or inspire individuals, or to conserve or extend some form of religion or worship, — in a word, to perpetuate existing organization, method, or stage of development, — the endowment of research is prompted by a desire to expand the bounds of human knowledge, to foster such insight into and understanding of the forces of nature, society, and the human spirit, that mankind generally, rather than the individual or the small and temporary group, shall be variously and cumulatively benefited. The magnitude and outreach of researches relating, for example, to solar energy, to fuel economies, to tuberculosis and venereal diseases, or to social organization and history, all of which are already endowed, are evidences of the constructive and contributive purposes behind the newer endowments for research.

These endowments fall into five main groups (1) pure science; (2) applied science — industry, medicine, etc.; (3) history, politics,

archæology, and ethnology, (4) society, including education; and (5) psychology, philosophy, and psychical phenomena. Not all of a particular endowment is necessarily confined to one of these classes, and not uncommonly the research purpose is one of a group of aims suggested to the grantees, to whom the foundation is intrusted; for example, the gift of Sir A. J. Jones of Liverpool, amounting to £500,000, might be used for the industrial education of negroes of the West Coast of Africa or for tropical disease research.

Two methods of endowing research are recognized. The first is the outright gift of a capital sum of money or property, almost invariably by a single giver, or family, or a small group of sympathetic associates, to a specially organized board of trustees or directors, with directions for maintaining a general research in a nominated field or along a prescribed line. The most notable American endowments of this class are the Carnegie Institution of Washington, D.C. (*q.v.*); the Rockefeller Institute (and hospital) for Medical Research, with \$8,240,000; the Crocker Endowment for Cancer Research (through Columbia University), with \$693,000, the Phipps gift and the Patten endowment, the latter with an income of \$10,000 per year, for tuberculosis research; and such great observatories as the Lick Observatory of the University of California (\$700,000), and the Yerkes Observatory of the University of Chicago (about \$360,000).

In like manner large endowments have been established in Europe. Among these are the Jones bequest, already mentioned, the Prince Roland Bonaparte Fund for scientific research, with an income of more than 25,000 fr.; the Beit Memorial Fellowships for Medical Research, with a capital gift of £215,000; the Sorby Research Fellowship of the Royal Society, with £15,000, and the Radium Institute of London, endowed, in addition to buildings, with £50,000 worth of radium, and similar institutes at Paris, Vienna, and the University of Heidelberg. Closely related to the regular research endowment are those which combine research with other obligations such as instruction, philanthropy, and propaganda. In this class belong the Russell Sage Foundation (*q.v.*), the Carnegie Trust for the Universities of Scotland (£8,000 and upwards of the income from £2,000,000, annually devoted to research); the Carnegie Foundation for the Advancement of Teaching (*q.v.*), and the Nobel Prize endowment of about \$9,000,000, for awarding annual prizes of about \$10,000 each in five fields, including physics, chemistry, and medicine and physiology. Departments, chairs, and fellowships in large universities in Europe and the United States are frequently so endowed or so administered as to constitute in the total a very large and significant endowment for research.

RESEARCH

The second form of endowment is that of the public grant or appropriation of an annual sum by a local, state, or national government, to a regular educational institution or to a special agency, usually for the prosecution of such research as relates to the health, resources, and industries of the political unit. These grants operate precisely as would the income from a capital endowment, they are commonly in the form of a continuing appropriation to an object to which the community is committed by its representatives; they express the desire and will of the organized unit to aid research, just as the bequest or donation expresses the wish of the individual donor. The government votes an annual revenue rather than a capital grant, because the government has a continuing, and not a periodic, existence and power. The revenue thus guaranteed is frequently the equivalent of the income from millions of endowment. In several notable instances private citizens have given great sums to the government for research; for example, James Smithson who in 1826 gave his estate to the United States for "the increase and diffusion of knowledge among men." (See SMITHSONIAN INSTITUTE.)

European governments have long recognized the propriety and advantage of granting subventions for widely variant research enterprises. Some of these have been particular and temporary, like grants of France for scientific research in Morocco or about the South Pole, or like the British grant of £20,000 for Antarctic exploration; others are permanent and general, as the annual grants by Parliament to the British Royal Society (about £20,000) in aid of scientific research and publication, £50,000 from the Development Grant for agricultural research; and the French subventions for like purposes to the *caisse des recherches scientifiques* and to the *observatoire d'astronomie physique* (about 100,000 fr.)

In the United States both the Federal and the State governments are practically committed to large schemes of permanent support of research through annual or biennial appropriations of millions of dollars. In each of the forty-eight States and three Territories are Agricultural Experiment Stations maintained cooperatively by the State and the United States, from the latter each State receives under the Acts of Congress of 1887 and 1906 \$30,000 annually. At least one half of the total annual \$1,545,000 must be devoted to research, according to plans approved by the Office of Experiment Stations in the Department of Agriculture. The States appropriate about half as much as the Federal Government for these Stations, but probably a smaller proportion goes to research, though certain States have special research agencies, e.g. the Institute of Animal Nutrition, of Pennsylvania.

The United States carries on great research enterprises in connection with the work of

certain bureaus. Especially noteworthy are the Bureaus of Standards, Chemistry, Plant Industry, Animal Industry, and American Ethnology, and the Public Health Service, for whose support, for administrative and routine purposes as well as for research, annual appropriations of more than \$1,500,000 are made.

RESPIRATORY DISEASES — See CROUP, GRIPPE, TUBERCULOSIS.

RESPONSIONS — The entrance examination or "Smalls" at Oxford University. All candidates must satisfy the examiners in the "stated subjects" which include: arithmetic; elementary algebra (simple equations) or the elements of geometry (practically Euclid, Bks. I-III), Greek and Latin grammar; Latin Prose Composition; either unprepared translation from Greek and Latin or translations of passages from prepared books, previously prescribed (covering usually Homer, Euripides, Plato, Xenophon, Caesar, Cicero, Horace, and Vergil). For those candidates who desire exemption from the classical part of the First Public Examination there is an examination in "Additional Subjects" including: (1) portion of a prescribed Greek or Latin, French, German, or Italian historical or philosophical author; (2) a portion of Bacon's *Novum Organum*; (3) the Elements of Logic, deductive and inductive. A large number of equivalents and exemptions from the Responsons is provided. Special substitutes are allowed for Orientals in place of Greek and Latin.

See OXFORD, UNIVERSITY OF.

RESTAUT, PIERRE (1696-1764).—French grammarian. Destined for holy orders, he later turned his attention to the law, which he entered in 1740. He is best known to the educational world through his *Principes généraux et raisonnés de la grammaire française* (avec des observations sur l'orthographe, les accents, la ponctuation, et la prononciation, et un abrégé des règles de la versification française), 1730, the first really elementary grammatical treatise in the French language. This embodied many of the ideas of Rollin (q.v.) and remained the standard text for three quarters of a century. During his life this went through

RETARDATION

nine editions, and appeared last at Lyons in 1817. Other well-known and successful books were, *Abbrégé de la grammaire française* (1732) and *La vraie méthode pour enseigner à lire* (1750). P. E. P.

RETARDATION AND ELIMINATION OF PUPILS — One measure of the success of a system of free public education is found in the number of years of schooling, or amount of work done by those who attend the schools. In a well-organized school system progress from grade to grade should be regularly achieved by nearly all the pupils, by virtue of the fact that the courses of study and class organization provided place children in groups according to their ability, and give them such instruction as they are capable of mastering during the period assigned for a given grade. That our schools have not achieved this perfection of organization is indicated by the studies which have been made in the field of retardation and elimination.

The most satisfactory data upon which to base a study of either retardation or elimination is a cumulative record of the school history of each pupil involved in the study. Such cumulative records have unfortunately only recently been introduced in our city school systems, and have not been available in sufficient numbers to furnish the data necessary for many of the most significant studies already made in this field. In the absence of these specific data with regard to progress, scholarship, age, and the like, investigations have been made based upon age and grade data from our public school systems. From such a table one can determine, by reading the total of the ages, the age at which children leave school. From three of the more important studies that have been made, the following diagram, indicating elimination, was prepared by the writer, and appears in the *Bulletin* of the United States Bureau of Education.

It will be noted that elimination has become a considerable factor by the time the fourth year of the elementary school course is reached, and that children continue to be eliminated from our schools in large numbers and with remarkable regularity from that time on. By the time the eighth year of the elementary school course is reached, we may expect to find only about 40 per cent of those who entered school seven years previously. In the

RETARDATION AND ELIMINATION

diagram given below the calculations are based upon estimates of the number beginning, calculated on a different basis for each of the curves. It is significant, however, that the general tendency is found to be the same by each of the separate investigators, the chief difference, which occurs in the grades four to seven, being accounted for by allowances made for retardation by Thorndike and Strayer which do not appear in the Ayres calculations.

Our system of public schools retains most of the children who enter them until they are eleven or twelve years of age. There is a noticeable dropping out, if one reads the tables of ages at eleven years of age. About one half of the pupils have dropped out by the time they are fourteen years of age, and approximately five sixths by the time they are sixteen years of age. If one were to correct the table of ages for the growth of population, death, the transfer of pupils from public to private schools, these estimates of elimination would be slightly decreased. From the standpoint of the amount of education secured by children who attend our schools, it is safe to say that approximately 90 per cent of them have done the work indicated by being found in the fourth grade, 80 per cent of them reached the fifth grade, 70 per cent the sixth grade, 55 per cent the seventh grade, 40 per cent the eighth grade, 35 per cent the first year of high school, 25 per cent the second year of high school, 17 per cent the third year of high school, and 14 per cent the fourth year of high school. Of course these estimates of the amount of education received, or of the age at which children leave school, vary tremendously among the several hundred school systems of the country. There are school systems which keep practically all of their children until they are fourteen years of age, and who retain the majority of them through the high school course. There are other communities which,

RETARDATION OF PUPILS

because of the lack of a compulsory education law, or on account of its inadequate enforcement, show a considerable falling off by the time children are ten years of age, and an extremely small percentage of children beyond the seventh grade of the elementary school course. The figures which are given above are the median figures for the school systems which have been studied, that is, half of the school systems would show a somewhat more favorable condition, while half of them would be distinctly inferior with respect to the length of school life or the grade of work accomplished by the children who attend the schools.

The problem of retardation may be approached either from the standpoint of the age of children in a given grade, or from a consideration of the number of years it has taken these pupils to reach the grade in which they are found. Strictly speaking, a pupil is to be considered retarded only when he has repeated one or more grades of school work. On the other hand, the composition of any grade is apt to consist of children of various ages, the extremes often representing a difference of from four to six years. This feature presents a problem to both the teacher and administrative officer which is none the less difficult by virtue of the fact that some of the over-age children may not have actually repeated in the grades through which they have passed. De-

RETARDATION OF PUPILS

fining normal age for the first grade as from six to eight years, for the second grade seven to nine years, for the third grade eight to ten years, and so on, there will be found in any grade a few children who are by this standard below normal age, more who are of normal age for their grades, and a considerable number who are above normal age. Of those who are above normal age there is an occasional child who has entered late, and who has actually made rapid progress in the grades already passed. There are some children who, because of late entrance, appear as over age even though their progress through the school has been normal. By far the majority of children who are over age are those who have actually made slow progress, that is, repeated one or more of the grades through which they have passed. It is safe to assume that 70 per cent, at least, of all of those who are considered retarded on the basis of being over age, are actually retarded if measured by the progress standard. Remembering that the percentage of children over age must be corrected, if we would know the actual amount of retardation as measured by the progress standard, the following percentages, which are the median percentages derived from a study of 310 cities of varying size in all sections of the United States, give some idea of the amount of retardation to be found in our schools.

POPULATION	PERCENTAGE OF "OVER-AGE" PUPILS								TOTAL PER- CENTAGE		"UNDER-AGE" PUPILS	
	One Year		Two Years		Three Years		Four Years and over					
	Boys	Girls	Boys	Girls	Boys	Girls	Boys	Girls	Boys	Girls	Boys	Girls
25 000 and over (133 cities) .	20	18	10	9	5	3	2	1	33	32	4	4
Less than 25,000 (136 cities) .	20	18	11	8	4	3	2	1	34	30	1	5

There are cities which show as little as 8 or 10 per cent of their pupils over age, while at the other extreme are found cities with as many as 70 per cent of all of the children over age. It is interesting to note that in the best cities girls show a smaller percentage over age than boys, and that in the cities making the poorest showing the same tendency is present.

The study of retardation must take account not simply of the amount of repeating or of over age throughout the school, but must also consider the relative difficulty of the grades as measured by the percentage of repetition found in each. Dr. Blan, in his study of the *Incidence of Retardation*, found that of those now in the eighth grade, a larger percentage repeated in the fifth than in the fourth, a larger percentage in the sixth than in the fifth, a larger percentage in the seventh than in the

sixth, while in the eighth grade there were fewer repetitions than in the seventh. From this and other data based upon cumulative records of the pupils studied, he argued correctly that the grades from the fourth to the seventh inclusive are increasingly more difficult. The small number of repetitions in the eighth grade is due to the fact that there is a marked tendency to graduate pupils who have once reached the last grade of the elementary school.

In the table given above, the number of children who are under age is also indicated. It is a remarkable fact that regardless of all of our discussion concerning flexible grading, there are comparatively few children who make more than normal progress. A uniform course of study adjusted to meet the needs of the middle group ought to permit as many children to make rapid progress as make slow prog-

RETARDATION OF PUPILS

ress Such a condition of affairs was actually found in a study made by Dr Keyes of the *Histories of School Children in a New England City*, in which more than usual attention was paid to the problem of grading and promotion. It has sometimes been argued that since few children make rapid progress, it follows that our courses of study are adjusted to the brighter children. This seems doubtful. In all probability, the reason for a lack of rapid progress upon the part of bright children has been found in the inflexibility of our system of grading and promotion, and in the feeling common among teachers and supervisors that normal progress is entirely satisfactory. Indeed, capable children often pass through the several grades of our schools without ever being put in a position where they are required to do their best work.

Retardation is due to a variety of causes. Illness extending over a long period, moving from one district to another, or from one city to another, backwardness or mental deficiency, the lack of a school course adjusted to the needs of varying abilities, all contribute their quota to the sum total of retardation. Those who are retarded are, of course, more likely to be eliminated than are those who succeed with their school work, so that a lack of adjustment to the needs of children of varying abilities results not simply in repeating, but also in early elimination from our schools.

The study of the problem of elimination and retardation has emphasized the necessity for modifying our curricula. A single curriculum leading from the first grade of the elementary school straight through to the college or university is manifestly not satisfactory. If our schools are to serve the purpose for which they are established, they must take account of the facts of individual differences in interests and in abilities. Classes for those who are backward, mentally deficient, or physically deficient, are already being organized throughout the United States. In New Jersey a recent law provides that all children who are three or more years over age are to be placed in special classes having not more than fifteen pupils. The key to the situation would seem to be found in the organization of courses of study with a minimum of achievement demanded of all, with definite provision for additional work upon the part of those who are of average ability, together with special classes and special schools, especially in the upper grades of the elementary school, for unusually capable children. It has been suggested that the school course beyond the sixth year be divided into three parts,—one division leading to the traditional high school course, another to the high school commercial course, and a third in preparation for industrial or trade education. Whether or not the division comes at the end of the sixth year, it will be necessary at some place in our school course

REUCHLIN

to provide for a differentiation which will make possible a much greater variety of educational opportunity than is at present found in most cities in the United States. The ideal of education in a democracy will be realized when it is possible for each child to work to the maximum of his capacity throughout his school course, and to secure during those years devoted to school capacity that training which will best fit him for his life's work. G. D. S.

RETENTION. — That phase of the memory process which is involved in holding the earlier experience either in the nervous structure, or in a conscious predisposition ready for revival or recollection and recognition. Retention is a physiological process and undoubtedly depends upon the general property of organic matter, which is described under the term "organic memory" or under the general term "habit." In general, any physiological structure which has been affected by external stimulation, or has performed an act, will be so modified in its structure that at a later stage it will tend to return to the condition into which it was brought through the stimulation or action.

RETIREMENT OF TEACHERS. — See PENSION SYSTEM FOR TEACHERS; TENURE, PERMANENCY OF.

REUCHLIN (CAPNIO), JOHANN (1463-1522). — German humanist, born at Pforzheim and there educated. Possessing a good voice, he became attached to the court of the Margrave of Baden, who sent Reuchlin in charge of one of his sons to the University of Paris. Here Reuchlin studied Greek and probably Hebrew. He later went to Basel, continued his Greek studies, and published (1475-1476) a Latin dictionary (*Vocabularius Dreviloquus*). Reuchlin accepted the pronunciation of Greek

REUCHLIN

as he learned it from his native Greek teachers and in defense of the so-called Reuchlinian (as opposed to the Erasmusian) pronunciation he wrote the *Dialogus de recta Latini Græcique Sermonis Pronuntiatione* (1519). He again returned to France and studied law at Orleans and Poitiers. In 1481 he taught at Tübingen and was recommended as interpreter to Eberhard of Württemberg, with whom he went to Italy and there made the acquaintance of members of the Medicean Academy at Florence. For several years he continued in the service of Eberhard. In 1490 he was again in Italy and met Pico della Mirandola, whose Cabalistic doctrines he adopted and embodied in the mystical *De Verbo Mystico* (1494) and *De Arte Cabalistica* (1517). In 1492 he was sent to the court of Frederick III at Lanz, where he studied Hebrew under a Jew, Jacob ben Jehiel Loans, the Emperor's physician. On the death of Eberhard, he was invited in 1496 to Heidelberg by Dalberg and became the center of Greek studies there. In 1498 he was again in Rome and pursued his Hebrew studies. He is next found in the employment of the Suanian League (?1502).

Reuchlin's services to the development of scholarship lie mainly in the introduction and spread of Hebrew as one of the learned tongues, although his contributions in Greek were not inconsiderable. In 1500 he published the *Elementa Hebraice Lingue*, a lexicon and grammar to serve as an introduction to the study of the Holy Scriptures. For ten years following his refusal to assist John Pfefferkorn, a converted Jew, in his plan to destroy all Hebrew books but the Old Testament (1500), he was embroiled in controversies with Pfefferkorn and his supporters, the Dominicans and other reactionaries at Cologne and elsewhere. The result of the litigation, through the services of Ulrich von Hutten and Franz von Sickingen, was fortunately favorable to Reuchlin. The whole incident is made noteworthy by the rallying of the leaders in the humanistic movement to the side of Reuchlin and the publication of the *Epistolæ Obscurorum Virorum* (q.v.). Reuchlin, like Erasmus, by his appeal to original sources played an important, if involuntary, part in promoting the Reformation.

After the victory over his enemies in 1519, Reuchlin retired for a time from public life, but in the last two years of his life he lectured again at Ingolstadt and Tübingen. To Reuchlin's interest and affection the next generation probably owed the success of his grand-nephew Melancthon (q.v.), whom he advised to study at Wittenberg.

REVIEW. — A classroom exercise devised to survey the facts and principles previously learned by observation, discussion, reading, etc., is a review. It is literally a re-viewing of already acquired knowledge in a detailed and completely connected way, so as to relate the items and emphasize the more important of them. It is a summary in which various truths intensively studied are seen as parts of an organized whole, accurately related and well unified. The review may be organized by either of two conspicuous methods: (1) Through the construction of a logical outline which gives a final logical view of the field, or (2) through performing a concrete task involving the knowledge acquired, which gives an arrangement of facts and principles in their practical grouping and sequence. Every review not only gives a new view of ground covered, it tends to test previous acquisitions and to fix important truths and their relationships. II. S.

REVIVALS OF LEARNING, EARLY. — The arrogation of the term Renaissance (q.v.) to the classical awakening of the fifteenth century and the characterization of the Middle Ages as the Dark Ages for a long time tended to obscure the fact that learning and letters flourished in the Middle Ages at different periods, although the characteristics were not always the same. It may almost be set up as a thesis that revivals of learning nearly always coincided with periods of order, and that

periods of disorder were inimical to the studies. Such revivals of learning took place early in Ireland (*q.v.*), passed over to England (Northumbria), with Bede (*q.v.*) as its chief representative. To some extent there was a revival under Alfred the Great (*q.v.*). On the continent, of course, the best known period is that of Charlemagne and Alcuin (*qq.v.*), of the latter's disciples, Einhard and Rabanus Maurus (*qq.v.*), and their pupils. From the eleventh century the reform of the monasteries, the revival in architecture (Gothic and Romanesque) and art, the rediscovery of Aristotle, the continued interest in Plato, the study of the seven liberal arts, the great scholastics Aquinas, Albertus Magnus, Roger Bacon, Abélard, the Arabic influences in medicine and philosophy, the activity shown by translators, the patronage of Emperor, kings, and other rulers (Alfonso X, Frederick II, Charles of Anjou, etc.), the rise of the universities, the growing wealth of Italian cities, the architecture and art of the period, the work of Dante and Petrarch, — all these are connecting links between the so-called Dark Ages and the Renaissance. Intellectual activity was continuous; a difference of emphasis of content and outlook mark the distinction between the early revivals and the Renaissance.

REYHER, ANDREAS (1601-1673). — A German schoolman, was born at Heinrichs, a village in the county of Hrenneberg, Franconia, and studied at the University of Leipzig, where he received the master's degree. He was rector of the gymnasium in Schleusingen, then of that of Lüneburg, and finally, from 1642 until his death, rector of the gymnasium of Sachsen-Gotha, under the duke Ernst the Pious (*q.v.*). By his direction he issued the famous Gotha *Schulmethodus* (1642), a most remarkable course of study for elementary schools, based on the principles of Comenius and Ratke (*qq.v.*). Instruction in the elementary schools was to include not only religion, reading, writing, arithmetic, and singing, but also the "knowledge of some useful things," by which was meant acquaintance with natural phenomena, plants, and animals, as well as some home geography, mensuration, and even elementary civics. Reyher is the author of a number of textbooks on grammar, logic, and rhetoric; his Latin and German *Thesaurus* went through several editions, the last one dating as late as 1733. F. M.

REYNER, EDWARD (1600-1668) — Puritan minister, vicar of St. Peter at Arches in Lincoln for nearly forty years, and writer

on 'human learning'; born at Morley, near Leeds. In 1644 he wrote his *Precepts for Christian Practice*, a work which, amongst other things, lays down the mutual duties of parents and children. But Reyner's chief work from an educational point of view is concerned with the controversy concerning the relation of learning to spiritual development and influence. This book is entitled: *A Treatise on the Necessity of Human Learning for a Gospel Preacher*, showing the benefits of learning in all ages, and showing the influence of Francis Bacon and of J. H. Alsted. Reyner, who was a strong Parliamentarian in the Great Civil War, was driven away from his living (1643-1648). He was one of those ejected in 1662. F. W.

RHETOR. — See RHETORIC; ROMAN EDUCATION.

RHETORIC. — Definition — Rhetoric is the theory of composition (*q.v.*) These two terms, rhetoric and composition, and their equivalents in several other languages, have become synonyms; for few teachers have ever concerned themselves with the theory except in some immediate connection with the practice, and the practice of even children in school has always demanded some guidance from theory. Such elementary theory, as well as the practice, is often in modern English usage called composition; but the term rhetoric has persisted. Indeed, it is valuable for precision. Composition being equally applicable to all the fine arts, the useful art of composition in words has through many generations been distinguished as rhetoric.

The further distinction between the useful art of words and the fine art, or literary art, is expressed in a separate Greek term for the latter, *poetia*, or, as we commonly say to-day, poetics. The boundary between rhetoric and poetic being vague, the former has of old invaded the territory of the latter and even made large annexations. Nevertheless the distinction is important. There is in fact an art of words for the common uses of address, and a further and higher art of words for the special uses of individual expression. Either may help the other; both may be included in the survey of certain courses or manuals; but the failure to distinguish the scope of the former from that of the latter has more than once confused the pedagogical application of rhetoric.

The ancients meant by rhetoric, not always exclusively, but always mainly, the useful art. It is obvious from the very etymology of the

word that they meant the art of speaking; it is not so obvious, nor is it always remembered, that they meant the art of public address, of speech for the practical purposes of persuasion. Oral address with them was the more practical, as it still is to-day, though no longer to the same extent, written address with them was not common enough to be so generally practical. Except for literary purposes, writing was so unusual as to demand no further discussion in its general aspects than could be included in the doctrine of oral address. To-day, when nearly everybody writes, it is easy both to restrict unduly the pedagogical use of oral composition and to misunderstand the significance of the ancient term rhetoric. By rhetoric the ancients did, indeed, mean oratory, they meant the art of oral address; but they taught as rhetoric more than we now usually mean by oratory. Their idea in the teaching of rhetoric was to inculcate habits of public effectiveness, of persuasiveness on a platform, indeed, but also of the moving of men in all communal affairs. For this reason, and not merely because they included description and narration in poetics, they generally restricted rhetoric to the forms of exposition and argument. Thus focused, rhetoric filled at once a distinct and a large place in the ancient scheme of education, and, thus focused, it has held its place through the centuries.

Aristotle. — The early history of rhetoric survives in the mere names of Corax and Tisias, in faint echoes of the doctrines of Gorgias and Thrasymachus, in the traditions and occasional precepts of the Attic orators, especially Isocrates, and in certain passages of the dialogues of Plato. Though this early history is worth special study, rhetoric for the general concerns of education begins properly with Aristotle (*q.v.*) His *Rhetoric* is complete, not only as surveying the whole scope, but as determining the scope in relation to the other main directions of education. Thus the first great treatise has been an almost continuous educational force, both because of its philosophic finality and because of its pedagogical intent. Quite as important in the history of education as the *Elements* of Euclid, it gave rhetoric a pedagogical significance which still constitutes a standard. The essential lines of this wonderful book are as follows: —

Book I surveys by definition and division the opportunity of the public speaker. (1) The rhetoric is the complement of logic (*ethica*). It is the art of persuasion formulated by investigating the methods of successful address; and its object is to promote a habit of discerning what in any given case is essentially persuasive. Proof as contemplated by rhetoric proceeds by such means as may be used in public address. Instead of the syllogism, which is proper to abstract logic, rhetoric typically uses the enthymeme, that approximate syllogism which is proper and necessary to the actual concrete discussion of public questions. Thus rhetoric serves as a general public means (1) of maintaining truth and justice against falsehood and wrong, (2) of

advancing public discussion where absolute proof is impossible, (3) of cultivating the habit of seeing both sides and of exposing sophistries and fallacies, and (4) of self-defense. (ii) The means of persuasion outside of rhetoric (*extra rhetorice*) are witnesses, documents, and other evidence, the means within the art of rhetoric (*intra rhetorice*) are the moral force of the speaker, his adaptation to the disposition of the audience, and his arguments. (iii) The three fields of rhetoric are (1) deliberative address to a popular assembly, discussing the expediency of a proposal for the future, (2) forensic address to a court, discussing the justice of a deed in the past, and (3) panegyric, commemorating the significance of a present occasion. The eleven remaining chapters of this book analyze each of these fields in its main aspects, or fundamental topics, e.g. wealth, happiness, government, crime, virtue, etc.

Book II studies the audience. Resuming the general idea of rhetoric as the moving of persons by a person, i.e. as dealing with human nature, Aristotle proceeds to examine in ten chapters the common human emotions: anger, love, fear, shame, benevolence, compassion, envy, emulation, and their opposites, analyzing each of these by definition and by its ordinary objects and occasions. The relation of these to the formation of character leads to six chapters on character in youth, in age, in the prime of life, and on the typical dominant traits of character seen respectively in persons of social rank, of wealth, of power, and of good fortune. (The classification here will be more satisfying as psychology, if we remember that it analyzes the common types of character and emotion in a crowd.) Aristotle is attempting neither an analysis of mental operations nor a science of human nature, but such a practical classification as may indicate the habit of adaptation to the feelings of an audience. It is significant that he discusses appeal to feeling before appeal to reason, and that he discusses the latter in relation to the audience before discussing it in relation to the subject matter. After recapitulation at this point, the book adds seven chapters on the common topics for preliminary analysis of a subject and the common methods of argument. The argument of actual public address, i.e. rhetoric as distinct from logic, if inductive, is, for example, whether imperfect induction or analogy. If deductive, it is enthymeme, whether manifest, prevalent, logical exclusion or *reductio ad absurdum*. In marking the popularity of the inductive, or of destructive enthymemes over the constructive, and pointing two common fallacies, the book concludes with analysis of refutation.

Book III studies the speech itself. Book I having presented rhetoric from the view of the speaker, and Book II from the view of the audience, Book III now applies it directly to the speech. Style, the art of saying things, includes (1) *lexis* as the sources of persuasiveness in the facts, (2) arrangement and expression, and (3) delivery. Study of the last is urged, but is dismissed summarily in (i) as consisting of (a) the handling of the voice, (b) stress and inflection, (c) rhythm. Nor is (1) elaborated. Most of the book discusses (2). Expression, diction, or phrase is analyzed (*ii-xii*) as follows: *ii-iv*, perspicuity and propriety, figures and ornament in prose, *v*, purity, *vi*, dignity, or amplitude, *vii*, aptness as emotional and moral appropriateness, *viii*, rhythm in general; *ix*, the two typical measures of sentence structure, "loose" and periodic, *x-xi*, force or vivacity, through figures and through descriptive method, *xii*, aptness as appropriateness to the kind of speech, descriptive, controversial, popular, or forensic. Arrangement, or order, considers first (*xiii*) that every speech consists essentially of exposition, or the statement of facts, and proof, or persuasion, but formally a speech may be considered (*xiv-xix*) as to its introduction (*exordium*), exposition, proof, and peroration. (For detailed analysis of all three books see *Welldon's Translation*, London and New York, 1880, pp. ix-xlvii.)

Cicero. — There is a gap in the history of rhetoric from Aristotle to Cicero. For authors of the intervening centuries show only a few un-

certain ascriptions. Nevertheless the common stock of rhetorical tradition used by Cicero shows certain additions. Thus it had become commonplace that the exordium should win the audience to sympathy, attention, and an open mind, that the exposition should be brief, lucid, and plausible, and so on for the other parts of a speech. Aristotle's analysis of sentence structure had been carried into smaller details. His enumeration of figures of speech (*humana orationis*) had also (unhappy precedent!) been extended and elaborated. Even humor had been analyzed as a means of persuasion. More important is the accepted division of rhetoric into five parts: (1) *edificatio* (*inventio*), the gathering and developing of material, (2) *taxis* (*dispositio*, *collocatio*), arrangement, order, or composition in the large, (3) *lexis* (*elocutio*) style in the ordinary restricted sense, i.e. diction and sentence structure; (4) *mnemoria* (*memoria*), memory; (5) *propositio* (*actio*, *pronuntiatio*), delivery. This division, though partly implicit in Aristotle, had been developed and fixed since his time, and it has persisted, though with much shifting of emphasis, down to ours. Significant for those modern teachers who deal almost exclusively with the second and third of these divisions is the space devoted by most ancient writers to the first. Rhetoric held its place in the ancient schema of education partly because it systematically inculcated habits of approaching a subject, of questioning it from all sides, and of thinking it through. In this aspect also rhetoric was the complement of logic and became what Bacon later declared logic to be, the *organon*, or instrument, of the sciences.

Besides many incidental references, Cicero (*q.v.*) left seven works dealing mainly or entirely with rhetoric: *De Inventione* (about 80 B.C.), *De Oratore* (55 B.C.), *Partitiones Oratoriae* (about 51 B.C.), *Brutus* (16 B.C.), *Orator* (46 B.C.), *De Optimo Genere Oratorum* (about 46 B.C.), *Topica* (44 B.C.). Of these the most explicit and suggestive are the *De Oratore* and the *Orator*. Though neither is a systematic treatise—Cicero is at great pains to disclaim the methods of the *scriptores artium*—both discuss at length principles of composition and details of style. His very definition of the orator as one who will handle any topic with foresight, order, charm, sureness of memory, and a certain dignity of delivery (I 81), enumerates all five parts of the common division noted above.

De Oratore, surely one of the pleasantest discussions of rhetoric, is a dialogue not unworthy of its Platonic model. The protagonists are the famous orators Crassus and Antonius, with Scrofula, Cotta, Caelius, and Sulpicius as minor interlocutors. In Book I Crassus maintains that the true orator commands the whole range of knowledge; Antonius, that he commands rather the whole range of forensic expression. The former presents the Academic theory, which Cicero explicitly approves elsewhere, that rhetoric should be regarded as a branch of philosophy. Of his arguments for

this theory, Cicero is himself a shining refutation. As a philosopher he is sometimes feeble and almost always derivative; as an artist he is brilliantly effective. So sure was his mastery of expression that even maxims of rhetoric received at his hands a distinction of style which gave them a permanent Ciceronian stamp.

Book II, after trying to show that oratory has only two fields, and accepting the division of a speech into five parts, urges imitation as the first counsel of study. The following treatment of *inventio* groups the common topics for analysis of a case under a few leading questions so memorable as to constitute at least an original revision of the pedagogy of rhetoric, if not an original contribution. Cicero argues eloquently that the current division of cases into those that are general or abstract (*infinitae*) and those that are specific (*finite*) is a capital error, for every particular case must be related to general principles. If oratory is to be more than an accumulation of facts, it must have the habit of such reference. This contention, to which he reverts again and again, is of the very essence of rhetoric, which is the art of bringing things home, of finding the means of persuasion in the fundamental concerns of humanity. As to the other aspects of *inventio* he is less suggestive, and as to *dispositio* and *memoria*, quite summary. Book III, after starting at length that rhetoric belongs with philosophy, gives a rather thin treatment of the remaining divisions, style and delivery. Most of the practical value of *De Oratore* is in Book II under *inventio*. Cicero's *Orator* professes to present the ideal orator. Though ostensibly critical, it contains a good deal of definite precept, especially Cicero's amplest discussion of style. The introduction transmits a division, which has been ascribed to Theophrastus, of oratory into three styles: (1) *genus grande*, (2) *genus medium*, (3) *genus tenue*. If not futile, this division has become practically vicious in its later interpretations (It has survived in France, at least, down to our own day). The best that can be said for it is that in Cicero's hands it is applied to the three tasks, or objects, of oratory: to prove (*genus tenue*), to please (*genus medium*), and to move (*genus grande*). Doubtless, the perfect orator, as Cicero says, should be master of all three, but that is hardly warrant for a division into three styles, nor is this warranted in Aristotle. Discussing *inventio* and *dispositio* summarily as matters rather of general intelligence than of eloquence, Cicero devotes about three-fourths of his space to *elocutio*, or style, as the very mark of the orator. Distinguishing prose style from poetic, Cicero discusses what is apt to each of the three prose styles noted above. As to figures he is summary, ampler as to harmony in general, and most ample and systematic as to prose rhythms.

Though Cicero was a great master of style, and at least an important critic of style, his contribution to the theory of rhetoric goes little beyond the sharpening of old precepts and the re-defining and newly relating of matters of diction. Composition in the stricter sense receives less of his attention. He is always primarily the artist of phrase and cadence.

Dionysius of Halicarnassus, writing his treatise on the *Composition of Words* (*Περὶ συνθέσεως ὀνομάτων*, *De compositione verborum*) in Greek at Rome a generation later (20-10 B.C.), though he declares his intention of instructing practically for political oratory, draws his examples mainly from literature. For the limitation of his treatment of *elocutio* he offers the doubtful pedagogical reason that, whereas *inventio* demands some maturity of judgment, "the love of literary beauty flourishes naturally in the days of youth;" and throughout he implies effectively the sound

pedagogical principle that rhetoric promotes appreciation through imitation.

His division is noteworthy as being, not analytic, but synthetic; i.e. he divides composition into its processes. (1) the choice of expressions that will combine well, (2) the scheme, or order of parts, (3) revision for adjustment. Thus frankly assuming the attitude of the artist, he proceeds to discuss the four means to beauty of composition: (1) euphony, (2) rhythm, (3) variety, (4) aptness. His division of composition into three modes, severe (*σφοδρά*), smooth (*γλαφυρά*), and blended (*εὐκτατόν*), differs from the three-fold division adopted by Cicero (and by Dionysius himself in his essay on Demosthenes), both in point of view and of giving even greater consideration to rhythm. Rhythm, always a main consideration with Dionysius, is discussed finally in the relations of prose to verse. Instinct with literary feeling and charming in style, the book is more suggestive for appreciation than for practical discipline.

Quintilian (late first century A.D.), on the other hand, is laboriously practical. His *Teaching of Rhetoric* (*De Institutione Oratoria*), so minute and diffuse as to extend about four times the length of Aristotle's *Rhetoric*, includes the whole education of an orator. Thus, Book I deals with the early education of boys in speech; Book II, in specific detail, with the traditional elementary exercises in rhetoric. After surveying historically in Book III the terminology of rhetoric, he devotes IV to the exordium and statement of facts, V to the proof, VI to the peroration, VII to analysis of the case, thus giving four books to *inventio*. Books VIII-IX analyze style (*elocutio*). Book X discusses reading for style, imitation, writing and revision, translation and paraphrase, practice in abstract discussion, declamation, history, and dialogue, and in speaking extempore from outline. Book XI closes the treatment of *elocutio* with counsels of aptness, and discusses memory and delivery. The last book (XII) considers the orator himself in his personal qualities, his general education, his special training, and the fields at his command. Though Quintilian has no originality of view or treatment, and though his subdivision is sometimes pedantic, his book is the more important as a document; for it furnishes a substantially complete classification of the rhetoric handed down to his time through four hundred years as a branch of education.

Demetrius and Hermogenes.—Indeed, with Quintilian the classical tradition was substantially completed. The writers who carried it on into the Middle Ages were, so far as appears, compilers of manuals. Such was that Demetrius, whose *Do Elocutione* (*Περὶ ἐμπνεύσεως*) dates probably from the first century A.D.; such, in the second century, was Hermogenes of

Tarsus, whose manual was in turn much commented upon by later Greek rhetoricians. The famous treatise *On the Sublime* (*Περὶ ὑψους*), long ascribed to the rhetorician Longinus, is original, indeed; but it is not so much rhetoric as poetic. The times no longer offering the earlier opportunities of the senate and the forum, Demetrius, Hermogenes, and their followers develop more specific exercises in occasional oratory (Aristotle's third field) and turn it toward descriptive and dramatic display. The show description (*ἐκφρασις*) and the dramatic monologue (*ῥητορεία*) passed from the schools into the meretricious Greek romances. On the other hand, occasional oratory was directed to the highest aims by the development of Christian preaching, which in time evoked its special art, homiletic.

Medieval Rhetoric.—Medieval rhetoric generally repeated this modified classical tradition without further change. The medieval sense of its educational importance included rhetoric in the *trivium* (q.v.), enlisted the exposition of man as eminent as Isidore of Seville and Bede; and gave it place in the medieval cyclopedic compends. Thus Brunetto LATINI (1220-1294), or Brunet Latin, included rhetoric as Book VIII of his typical medieval compend of universal knowledge, the *Tesoro*. Part I of this cyclopedic work surveys history, physics, geography, and zoology; Part II, ethics. Part III groups rhetoric with politics, the art of public speaking with the art of government. The *Rhetoric* has some examples from the Bible, some from the Middle Ages, and one striking *ἐκφρασις* is a description of Iscariot. Indeed, the examples are largely narrative or descriptive; but the doctrine is the classical tradition, its chief source being Cicero's *De Inventione*. Plainly the classical distinction between rhetoric and poetic was fading.

Renaissance Rhetoric.—In the Renaissance the distinction was quite generally ignored. Interest in the classical rhetoric was stimulated both by the general revival of classical studies and by the discovery at Lodi, in 1422, of a manuscript containing all the rhetorical works of Cicero. But the interest of scholars and men of letters being rather in considerations of diction and even theories of style than in the logic of composition, the Renaissance rhetoric is largely poetic. In this way the history of rhetoric becomes so involved with the history of criticism as to obscure those aspects which are properly pedagogical. While the classical doctrine of *inventio* and *dispositio* is repeated formally, *elocutio* is elaborated with enthusiasm. The minute analysis of figures is part of the general concern with what is called in the English manuals exornation. The gradual shift of emphasis from structure to style, beginning centuries earlier and culminating in the Renaissance, had at least its compensations in

the development of critical ideas, but in so far as it affected the actual pedagogy of rhetoric, it was an unhappy deviation. For pedagogy rhetoric yielded very little, even to Erasmus (*qv*). The *De Ratione Dicendi* (Bruges, 1532) of Vives (*qv*), though it opens with sound philosophy as to words and ideas, proposes the discussion of common speech (*sermo*, not merely *oratio*), and otherwise promises a suggestive originality, is in the main a perfunctory and confused treatise on *elocutio*. Nor is his *De Consultatione* (Oxford, 1523) more than vague repetition of traditional advice. Preoccupation with dignity or elevation of style is not the mood in which either to teach or to learn the best lessons of rhetoric.

English Manuals (1550-1650).—This preoccupation appears in the typical sixteenth and seventeenth century English manuals. Richard Sherry describes his translation of Erasmus (1550) as "*A treatise of schemes and tropes* very profitable for the better understanding of good authors, gathered out of the best grammarians and orators . . . whereunto is added a declamation that chyliden even strapt from their infancie should be well and gently brought up by learnynge." Thomas Wilson's *Arte of Rhetorique* (1553, revised and enlarged 1560, and several times reprinted), memorable in the history of criticism for his attack on "inkhorn terms," nevertheless devotes most space to figures, and is little more than exemplification of a bare outline of classical tradition. Penner's *Artes of Logike and Rhetorike* (1584) deals mainly with details of propriety and ornament, without specific doctrine as to composition. John Barton's *Art of Rhetorick* (1634) is conceived as "the skill of using daintie words. . . . Adornacion consisteth in the sweetness of the phrase, and is seen in tropes and figures. . . . There be foure kinds of tropes: substitution, comprehension, comparison, simulation . . . A figure is twofold: relative, and independent. The relative figures are six: repetition, variation, gradation, correction, allusion, composition, etc. Such jargon, often and justly a reproach of rhetoric, is but the *reductio ad absurdum* of rhetorical analysis deviated.

Vossius.—In strong contrast with such laborious futility, the work of Professor Gerard Voss (Gerardus Ioannes Vossius) of Leyden has enduring value. Beginning with lectures on Aristotle in 1599, he published his *Partitiones Oratorias* in 1600, revised it in 1609, and finally divided it into *Rhetorices Contractae* (about 1630), a manual of rhetoric, and *Commentaria Rhetorica* (1633), an exhaustive compend of classical and medieval authorities. His *De Philosophia* (1658) includes a chapter on eloquence. This stands significantly between the chapter on politics and the chapter on criticism, and contains the pregnant sentence: "For eloquence is twofold,

oratorical and poetical, and either power is an instrument of philosophy, not in the way of logic, which is an instrument of knowing, whereby logic is the organon of all philosophy, but as an instrument of doing, and in this alone it serves practical philosophy." So large a view was to be expected of the ripe age of so eminent a scholar. For, in spite of a certain false emphasis inevitable in his time, Vossius restores the large outlines of rhetoric. Instead of following indirect and confused tradition, he goes back to the classical sources and intelligently relates to these, with many valuable citations, the doctrine and comment of the early Christian centuries and the Middle Ages. His *Commentaria* goes far in preparing the way for the still desired dictionary of rhetorical terms, and in other ways is the most comprehensive survey of rhetoric since Quintilian.

Jesuit Rhetoric.—The Jesuit teaching of rhetoric appears as strictly classical in the *De Arte Rhetorica* (Lyons, 1710, and often reprinted) of Dominic de Colonia. This catechism of Latin composition is based on Quintilian. It frequently cites the precept of Cicero, and still more frequently quotes his example. Cicero is the orator, as Vergil is still the poet; and the treatment, though couched as advice to tyros, is largely literary analysis. Citation also of Aristotle, of Demetrius and later Greek rhetoricians, and of Scaliger and Vossius, shows some acquaintance with the development of rhetorical tradition, but the conception remains classical, and the book shows the persistence of Quintilian at Lyons.

Eighteenth Century Rhetoricians.—The concern of the eighteenth century in both France and England with correctness and elegance tended to detain rhetoric in the field of diction and to consider it in aspects related to poetics. This tendency is still evident as late as 1783 in the once famous *Lectures on Rhetoric and Belles Lettres* of Dr. Hugh Blair, which have even been cited to prove that rhetoric in modern times has been merged in criticism. But meantime the permanent pedagogical values of rhetoric had been revealed afresh by Dr. George Campbell. Though considerably more than half of his *Philosophy of Rhetoric* (1776) is devoted to diction, the treatment is more practical in both conception and application; and the first book is an original rehandling of *inventio*. Again, rhetoric analyzes the means of persuasion in evidence and audience. Campbell handles rhetoric as a philosopher; Archbishop Whately, rather as a logician. His manual (1828) is entitled *Elements of Rhetoric, comprising an analysis of the laws of moral evidence and of persuasion, with rules for argumentative composition and elocution*. Nearly half of the discussion is devoted to argument as address to the understanding, about a quarter to persuasion as address to the feelings or

will Style is discussed simply as to perspicuity, energy, and elegance, with but twenty pages on figures. Elocution, in its present sense of delivery, constitutes Part IV. Less original and perhaps less influential than Campbell's, Whately's treatment nevertheless marks the essential lines of rhetoric in the nineteenth century. It is already a long way from Blair.

Bain — The remaining terms of the rhetoric taught in English to-day are almost all explicit or implicit in the *English Composition and Rhetoric* (1866) of that pioneer of modern psychology, ALEXANDER BAIN, professor of logic in the University of Aberdeen. The book is about equally divided between (I) style and (II) kinds of composition. Figures are treated first, indeed, and at considerable length; but they are treated psychologically as are also the "qualities of style." Without being technical, the treatment is based on the modern analysis of the mind. Whately's division of the "qualities" as clearness, force, and elegance has outlasted Bain's, perhaps because it keeps the practical point of view of actual composition, whereas Bain's includes also the critical point of view of appreciation. On the other hand, Bain is the more practical in devoting a separate chapter to the sentence, and another to the paragraph, setting forth the composition of each as a logical unit of discourse. Here is the germ of most recent teaching of composition. Bain may be said to have discovered the educational significance of the paragraph. Part II, on the kinds of composition, is no less original in introducing the fourfold division, now generally accepted, of composition into description, narrative, exposition, and persuasion. Bain's fifth category, poetry, may be regarded less as a fault of cross-division than as a convenience. Though his revised and enlarged edition (1887-1888) does not fulfill the pedagogical promise of the original work, Bain had already put our generation greatly in his debt by opening some of the most fruitful fields of the teaching of rhetoric in our time.

Recent Teaching in English — The teaching of rhetoric to-day relies far less than that of previous centuries on analysis of diction. Not only has the elaborate traditional classification of figures been generally abandoned, but the study of style is largely left to courses of literature, that is, to reading without direct application to writing. Such courses of literature as are topical rather than historical, exploring a particular literary form, such as the drama, are largely rhetoric in the sense common for several centuries from the Renaissance; but the dissociation from composition now classifies them as literature. On the other hand, both rhetoric and literature are commonly, though not always, taught by a single department of "English" in both secondary

schools and colleges. Within this single administration, rhetoric is usually taught for direct use in composition, literature for the development of appreciation. Though the term *belles lettres*, used for a time to indicate the latter purpose, is no longer current, the purpose itself is at once distinctly recognized and generally sought outside of the scheme of rhetoric.

Current manuals deal with words, therefore, as the expression of students rather than of masters, quoting from masterpieces such examples as may serve for imitation. In the discussion of sentences current rhetoric shows least modification of traditional doctrine. Though less is usually said of rhythm, and though the period is consequently presented in its logical aspects, the current doctrine of the sentence is substantially the classical doctrine presented less orally. The most striking shift of emphasis in teaching is the stress laid on the composition of paragraphs. The teaching of the paragraph has become the primary application at once of the classical *inventio* and of the classical *amplificatio*.

A fourth heading now often used is the whole composition. Under this are distinguished the four kinds of composition, description, narration, exposition, and argument (or persuasion). The classical analysis of appeal to feeling has been generally abandoned; and modern psychology has not yet suggested a new classification for purposes of rhetoric. As fundamental principles of the whole composition, the paragraph, and even the sentence, current manuals present unity, emphasis, and coherence. This is the modern division of the classical *dispositio*. The cross division of style into the qualities clearness, force, and elegance (or ease), though it resembles the classical division of style into kinds, is less firmly fixed. Elegance is applied both to diction and to sentence rhythm; force, where it is not restricted to diction, is equivalent to emphasis; clearness in the same way overlaps coherence. This division, therefore, seems both superfluous and out of line with the recent tendency to segregate considerations of diction and to stress the principles of construction.

Recent discussions of rhetorical theory have brought forward three main ideas (1) that beneath the accepted fourfold division of composition lies a more fundamental twofold division into what may be called logical composition (argument and exposition) on the one hand, and, on the other, literary composition (narration and description); (2) that writing should be so taught in college as to stimulate and train thinking, in order to make rhetoric more effectively the *organon* of all studies, (3) that in both school and college, rhetoric needs for the full realization of its function the recovery of oral composition. It should surprise no one to reflect that all three are

RHETORICAL SCHOOLS

ideas of the classical rhetoric. The third is obviously a return toward the schools of Greece and Rome. The second is hardly less a return to the classical emphasis on *inventio*. The first is the ancient distinction between rhetoric and poetic. For rhetoric is so old that it made its educational survey early along permanent lines of human nature.

RHETORICAL SCHOOLS.—The schools of Rome which were modeled after the Greek schools, taught by the sophists or rhetors. There were the higher schools giving the students a practical training for the public life of the times. For description of these schools see ROMAN EDUCATION and the references appended.

RHODE ISLAND, STATE OF.—Providence plantation was settled in 1636, and Rhode Island in 1638. The two were united and chartered as a colony in 1644, and this was admitted to the American Union, on ratification of the Federal Constitution in 1790, as the thirteenth state. In size, Rhode Island is the smallest state in the Union, having a land area of 1053 square miles. Its total population in 1910 was 542,810, or about the same as in Baltimore or Pittsburg. One half of this was in the cities of Providence and Newport. The density of population is 508.5 persons per square mile, the highest of any state. For administrative purposes the state

RHODE ISLAND

is divided into five counties, and these in turn into thirty-eight towns and cities. The county, however, is negligible in school administration.

Educational History.—Roger Williams settled in what he chose to call Providence in 1636, and William Coddington, Anne Hutchinson and a few others bought and settled Rhode Island in 1638, establishing freedom of religious worship in each. All were religious refugees from Massachusetts. In 1644 Williams obtained a charter in England, uniting the two plantations. A second charter was obtained in 1663, and continued as the fundamental law until the formation of the present state constitution in 1812.

Church and State, in the seventeenth century, were closely united, and the clergy looked after education with a deep solicitude. In Rhode Island, with its religious freedom and its hospitality to all persons persecuted because of their religion, this religious oversight and interest was largely lacking. As a consequence of this, and of the suffering from Indian wars and the existence of slavery in the colony, education began in Rhode Island only after it was established in the adjacent New England colonies, and its final development was due more to a public than to a religious interest in the schools. The colony, too, grew slowly, it being sixty-five years before there were 10,000 white people in it, and almost a hundred years before there were 18,000. As many of these were adventurers, and many others were conscientiously opposed to any State or Church control of education, no general educational legislation took place until after the close of the colonial period. Such advances as were made were made by the individual towns.

Newport claims to have established a school, by public vote, as early as 1640, and to have set aside one hundred acres of land for the permanent support of the school, "for the encouragement of the poorer sort, to train up their youth in learning." Providence took its first action in 1663, when the proprietors voted that one hundred acres of uplands and six acres of meadow should be laid out as school lands, and "reserved for the maintenance of a school in this town." In 1752 there is mention of a schoolhouse, and in 1767 the citizens voted to build "three schoolhouses for small children and one for youth, to provide instructions, and pay the expense from the treasury, and these schools to be under the supervision of the school committee." A plan for the organization of schools was outlined, was submitted to the inhabitants of the town for approval, and was rejected "by the poorer sort of the people, being strangely led away not to see their own as well as the public interest therein." The town of Barrington founded a school in 1673. The original proprietors of Bristol granted land, in 1680, "for the common improvement, for the encouragement and use of an able orthodox minister, and for the

use and encouragement of an able schoolmaster in the town," and in 1682 the citizens voted to provide a school and to make up from the public funds, up to £24 a year, what tuition fees of 3d a week did not bring in. A few local attempts were made to instruct the Indians, and a school for negroes was opened in Newport somewhere near 1770, but aside from these efforts and the votes of the towns above given, little seems to have been done until 1800.

The real founder of public schools in Rhode Island was John Howland, a barber in Providence, who was deeply impressed with the need of some form of public education for the children of the city. In 1789 he had helped to found the Mechanics and Manufacturers Association, and the work within this Association impressed upon the members the need of providing educational advantages for children. The movement met with approval in Providence and Newport, but with indifference elsewhere. A memorial was prepared and presented to the legislature in 1799, active work was done, and in February, 1800, the first general education law for the colony or state was enacted. Aside from Providence, no other community carried the law into effect, and so much opposition to it came from the other towns that the law was repealed in 1803, except for the city of Providence. For twenty-five years after the repeal of this law, there was no state school system in Rhode Island, even on paper. A few endowed schools in Newport and some of the other towns, many of them the result of lotteries, supplied whatever of free education existed elsewhere in the state.

The legislature of 1820 made an inquiry as to the schools in the state, and found that there were none outside of Providence, except a few in Newport. In 1821 the legislature appointed a committee to prepare a free school bill, but the committee never reported. In 1825 Newport was granted permission to raise \$800 annually to educate those unable to obtain schooling for themselves, and a scheme to start a state school fund by lottery was proposed. In 1827 several towns presented memorials, requesting action, and in 1828 the second free school bill was finally enacted into law. This law formed the foundation upon which the state free school system was eventually built. Towns were authorized to appoint school committees, which should appoint and supervise teachers, and to tax themselves for schools. To aid the towns, a state appropriation of \$10,000 a year from taxes on lotteries and auctioneers' licenses, was to be distributed to the towns in proportion to the population in each under sixteen years of age. A state school fund was also begun by setting aside \$5000 a year for investment, together with any excess over \$10,000 in the auctioneers' licenses and lottery fees. Five years after the passage of this law, a report for the state, com-

piled by a teacher, showed that there were 323 public schools in operation, for three months' terms, employing 375 teachers; and also 118 private schools, sustained by subscriptions, which were virtual continuations of the public school term.

The beginnings of state supervision were made in 1838, when the schools were first required to report to the Secretary of State. In 1839 the state school law was revised, the state appropriation was increased to \$25,000, and the "rate bill" (*g. v.*) was enacted in an effort to lengthen the term. An attempt was made at this time, also, to restore the impaired state school fund, which had been used at different times for state expenses, and the United States Surplus Revenue Fund (see NATIONAL GOVERNMENT AND EDUCATION) was set apart as a special school fund. In the state constitution of 1842 it was made the duty of the legislature to promote public schools, the school fund was made a perpetual fund, and the legislature was forbidden to divert or use the fund for any other purpose, "under any pretext whatever." No other constitutional provisions relating to education have since been added. In 1840 the first child labor legislation forbade the employment of any child under twelve years of age in any factory, unless such child had attended school three months during the year. A few years later this was made prohibitory for all children under twelve, and an educational test was applied to those from twelve to fifteen.

In 1843 the legislature authorized the Governor to appoint a state school agent to visit and inspect the public schools, with a view to their improvement. Henry Barnard (*g. v.*) was appointed, and in his report he outlined a new law to organize better the school system of the state. This became a law in 1845. The office of State Commissioner of Public Schools, to be appointed by the Governor, was created; the powers and duties of the towns were defined; school districts, with trustees, were created within the towns; the examination and certification of teachers and teachers' institutes were provided for; the organization of schools for advanced instruction and the formation of public school libraries were permitted. This same year saw the formation of the Rhode Island Institute of Instruction, an organization which has rendered much valuable service. The permission to organize schools for advanced instruction was to legalize the high school which was organized at Providence in 1843, and to which there was much opposition. This was the first free public high school in the state. Newport opened a senior department of the grammar school soon afterward, and high schools were established at Warren in 1847, and Bristol and Woonsocket in 1840. With the annexation of Pawtucket from Massachusetts in 1862, another high school was added,

making six high schools in the state by 1870. Excepting the formation of a state normal school in 1854 (which was abandoned in 1865), the increase of the state appropriation to \$60,000 in the same year, and the abolition of the "rate bill" (*q.v.*) in 1860, there was no educational legislation of any importance from 1845 until 1870.

The creation of a State Board of Education in 1870, to aid the State Commissioner and to have general supervision and control of all state schools, marks the beginning of a new era in school legislation in the state. In 1871 the state normal school was reestablished. In 1872 the State Board of Education was given power to appoint the State School Commissioner; the state aid for common schools was increased to \$90,000, and state aid was first granted for teachers' institutes and for evening schools, the terms of school committeemen were increased from one to three years, with only one third to be elected each year; school superintendents for each town were to be elected or appointed; and full annual reports from the town school officers to the State School Commissioner were required. In 1875 the free library law was enacted, state aid for free libraries granted, and improved statistical returns required from the schools. In 1883 the first state compulsory education law was enacted, and the state appropriation for schools was further increased to \$120,000. In 1884 schools, instead of the district, were made the unit for the distribution of state funds, and towns were required to duplicate the state grants; permission to towns to abolish the district system (*q.v.*) was granted; the election of town school superintendents was placed in the hands of the school committee; and the first attempt to prescribe any subjects of instruction was made by a law requiring the teaching of temperance—physiology and hygiene. In 1885 a state home for dependent and neglected children was created. In 1888 the Rhode Island State College of Agriculture and Mechanical Arts was established and opened at Kingston, superseding the previous agriculture grant to Brown University. In 1892 all private schools were required to be registered, and the State Board of Education was given the oversight of all deaf, blind, and feeble-minded children in the state. In 1894 a factory inspection act was passed, and factory inspectors appointed. In 1896 the school committee of the city of Providence was given the power to elect its city superintendent of schools, and to manage the schools, in large part, free from the interference of the city council. In 1898 the consolidation of small schools was authorized, and a bounty for so doing offered; state aid was granted for the first time to high schools, and a state examination system for teachers' certificates was begun.

Present School System.—At the head of

the present school system is a State Board of Education and its appointed executive officer, the Commissioner of Public Schools. The State Board of Education consists of the Governor, Lieutenant Governor, and six citizens elected by the legislature, two each year for three-year terms. Two must be elected from Providence County, and one from each of the other counties. The Governor is president, and the Commissioner is *ex officio* secretary. The members receive only their necessary expenses. To this board is given the general supervision and control of the public schools, normal schools, normal institutes, public libraries, and the education of defectives in the state. They may make rules and regulations for the enforcement of the school law, and for the government of libraries; may establish travelling libraries, or aid such libraries; may adopt blank forms and registers for use in keeping records and making reports by all public and private schools, apportion, with the aid of the Commissioner, a number of the special state appropriations for educational purposes, approve the high school course of study in all state-aided high schools, recommend to the Governor for appointment those to be admitted to the state institutions for the deaf, blind, feeble-minded, and dependent; and are given the power to approve the standards of lighting, heating, ventilation, seating, and sanitary arrangements for all schoolhouses in the state. The board acts *ex officio* as a Board of Control for the State School for the Feeble-minded, and for the State Normal School. The state board also appoints, for one-year terms, the State Commissioner of Public Schools and a State Inspector of Libraries.

The Commissioner of Public Schools appoints an assistant commissioner at \$2000, and his clerical assistance, for which \$1750 is allowed. He acts as the executive officer of the State Board of Education, and in reality performs many of its functions. In the class of general duties he is charged by law with the visitation of the schools of the state; the making of public addresses on educational topics, the furnishing of blanks and registers, and manuals for the school observance. He apportions the income of the state school fund, as appropriated by the legislature, to the towns; approves all grants of state aid to high schools and consolidated schools, and has charge of all expenditures for teachers' institutes and public lectures in the towns. He helps libraries in the selection of books, and is instructed to make recommendations to the towns, with a view to bringing about uniformity in textbooks. He has power to decide appeal cases, and his opinion, if submitted to and approved by a Justice of the Supreme Court, is final. He makes an annual report to the State Board of Education.

There are no county school authorities

RHODE ISLAND

For each town a school committee, usually of three, is elected for three-year terms, one third each year. Towns organized under a city form of organization, as Providence, have city boards of education. Each town must elect a town superintendent of schools each year, and fix his salary, though two or more towns, having not over sixty schools, may unite in such employment. State aid is granted toward the superintendent's salary, the state doubling any amount paid up to \$750. All superintendents must be certified by the State Board of Education. Each school committee elects, also, its own chairman and clerk, and the town treasurer acts *ex officio* as treasurer for the schools. Each town school committee must provide a sufficient number of schools, adopt courses of study for them, and furnish free textbooks and supplies; may transfer children, and suspend pupils, may close small schools; may select all teachers, and dismiss them for cause; must provide for the taking of an annual school census; may condemn land for school purposes; may make rules and regulations as needed; must appoint a truant officer; may provide free meals for school children; and must make an annual report to the State Commissioner, and may spend \$40 in printing the same.

School Support — The income from the state permanent school fund is appropriated by the legislature for distribution to the towns. At present this is fixed at \$120,000 a year, and this is distributed to the towns on the basis of \$100 to each school, though not over fifteen to a town, and the remainder on the basis of the school census, five to fifteen years of age. Each town is required to appropriate an equal sum, and this can be used only for teachers' wages. All forfeited apportionments and the net proceeds of auctioneers' licenses are added to the permanent fund, while the net proceeds of dog licenses are used for annual maintenance in the towns where paid. The state also makes a large number of small special appropriations.

Teachers and Training. — The state employs a total of about 2300 teachers each year, over one third of whom are in the city of Providence. Of these, 60 per cent have had normal school training, 25 per cent are high school or academy graduates, and 14 per cent are college or university graduates. The average salaries paid in 1911 were \$942 per year for men, and \$587 for women. A state salary law, enacted in 1900, requires a minimum salary of \$400 a year, and grants to towns one half of the extra amount necessary to pay this over salaries paid in 1900. All teachers' certificates are granted by the State Board, under rules and regulations adopted by it, the state certification system having completely displaced the old town licensing system. The state grants a pension to all teachers who have taught thirty-five years, twenty-five of it in the state, equal to one half of the average

RHODE ISLAND

salary during the last five years of service, though with a maximum annual grant of \$500. For the training of future teachers the state maintains the Rhode Island Normal School, at Providence, a large and important school.

Educational Conditions — The state is small and densely populated, and its system of school administration is not greatly different from that of a well-organized county in a western or southern state. Rhode Island is essentially a business and manufacturing state. Only 3.3 per cent of the total population in 1910 were living under rural conditions, while 80.7 per cent lived in cities of over 10,000 inhabitants. One third of the total population is foreign born, and about two thirds is either foreign born or of foreign parentage. The negro element forms a little over 2 per cent of the total, and accordingly we find any discrimination on the basis of color forbidden. The state has relatively good laws on child labor, factories, and attendance. Four state factory inspectors, one of whom must be a woman, look after the enforcement of the child labor and the factory laws, and town attendance officers look after school attendance. All private and parochial schools must cooperate in enforcing the attendance laws. Private and parochial schools, to be accepted for the required attendance, must be good, must keep public school teachers' registers, and must be taught in the English language. Incurables and persistent truants may be sent to the state reform school. Attendance from seven to fifteen is required, unless the elementary course has been completed, or unless the child is over fourteen and lawfully employed. All children under sixteen must possess age and schooling certificates, and these cannot be issued unless the child "can read at sight and write legibly simple English sentences." All schools receiving state aid, directly or indirectly, or exemption from taxation, must be open to state inspection. As practically all nonstate schools receive such exemption, almost all are open to inspection. Of the total school attendance in the state, about 77 per cent is in the public schools, 19 per cent in Catholic parochial schools, and about 2 per cent in private schools.

Evening schools are well developed in the cities and towns, fifty-three being maintained at last report. A medical inspection act requires the appointment of medical inspectors by the towns, and grants \$250 a year aid for this purpose. All pupils, teachers, and janitors must be given a medical examination at least once each year.

Secondary Education — Every town must maintain a high school, or arrange with an adjoining town to care for its high school pupils. The course of study must be approved by the State Board, if state aid is expected. This is granted on the basis of \$20 each for the first twenty-five pupils, and \$15 each for the

RHODES SCHOLARSHIPS

second twenty-five pupils, in average daily attendance. There were 22 public high schools in the state at date of last report, with an enrollment of over six thousand pupils.

Higher and Special Education.—The Rhode Island College, located at Kingston, is the agricultural and mechanical college. It receives the Government grants for agricultural instruction, and the state also appropriates \$30,000 a year toward its support. Its attendance is 250. Brown University (*q.v.*) at Providence, under Baptist control, is a large and important institution, opened in 1764, and is the only collegiate institution in the state offering full collegiate work. Both institutions are coeducational.

The state maintains a number of scholarships in the Rhode Island School of Design, at Providence, and two members of the State Board of Education have seats on the School of Design Board of Directors. The state aid granted to this institution is \$8000 a year.

The special institutions maintained by the state are the Rhode Island Institution for the Deaf, at Providence; the Rhode Island School for Feeble-minded, at Slocum, the State Home for Dependent and Neglected Children, at Providence, the Oaklawn School for Girls, at Howard; and the Soekanosset School for Boys, also at Howard. The last two are reformatory institutions. A number of feeble-minded pupils are cared for outside the state, and the blind are sent to the Perkins Institution for the Blind at Boston. E. P. C.

RHODES SCHOLARSHIPS.—Scholarships founded by the will of Cecil John Rhodes (1853-1902) to be awarded to citizens of the British Colonies, and to students from the United States and Germany. The scholarships are to be held at the University of Oxford, the founder's Alma Mater, and are of the annual value of £300 (£250 for German scholars), tenable for three years. The trustees of the will are the Earl of Rosebery, Earl Grey, Mr Albert Boit, Sir Lewis Lloyd Michell, Mr. Bouchier Francis Hayksley, and Dr. Leander Stan Jameson. Cecil Rhodes devoted his life to the service of the British Empire. Prevented by climatic conditions from living in

RHODES SCHOLARSHIPS

England for any length of time, he settled in South Africa only a few months after entering Oriel College, Oxford. In South Africa financial success opened up to him great opportunities for imperial service, inspired throughout by faith in the British Empire and desire to advance what he regarded to be its beneficent influence for civilization. The foundation of the scholarships was inspired by the same motives. To the maturing of a scheme for promoting the advancement of the British Empire Rhodes had already turned his thoughts as early as 1877. The plan of founding scholarships was not developed until 1899, when he drew up his sixth will, further elaborated by codicils. The intentions of the founder are best stated in his words, as taken from the will —

Whereas I consider that the education of young Colonists at one of the Universities in the United Kingdom is of great advantage to them for giving breadth to their views, for their instruction in his and manners, and for instilling into their minds the advantage to the Colonies as well as to the United Kingdom of the retention of the unity of the Empire. And whereas in the case of young Colonists studying at a University in the United Kingdom I attach very great importance to the University having a residential system such as is in force at the Universities of Oxford and Cambridge, for without it those students are at the most critical period of their lives left without any supervision. And whereas I also desire to encourage and foster an appreciation of the advantages which I implicitly believe will result from the union of the English-speaking peoples throughout the world and to encourage in the students from the United States of North America who will benefit from the American Scholarships to be established for the reasons above given at the University of Oxford under this my Will an attachment to the country from which they have sprung but without I hope withdrawing them or their sympathies from the land of their adoption or birth. Now therefore I direct my Trustees as soon as may be after my death and either simultaneously or gradually as they shall find convenient and if gradually then in such order as they shall think fit to establish for male students the scholarships hereinafter directed to be established each of which shall be of yearly value of £300 and be tenable at any College in the University of Oxford for three consecutive years.

For colonial students seventy-eight scholarships were assigned, and for the United States two scholarships for each state or territory. The scholarships are to be paid out of the income of the fund left for the purpose. By codicil of January, 1901, Rhodes left five yearly scholarships of the annual value of \$250 for three years for students of German birth to be nominated by the German Emperor.

After the death of Mr. Rhodes the trustees appointed Dr. George R. Parkin, president of Upper Canada College, Toronto, as their agent. Dr. Parkin conducted the negotiations with the University and Colleges of Oxford for the conditions under which Rhodes scholars would be received, and visited the centers from which the scholars were to be drawn to arrange schemes for their selection. Francis J. Wylie, M.A., Fellow of Brasenose College, Oxford, was appointed as representative of the trustees to act as adviser to the

Rhodes scholars and negotiator between those interested in the scheme and the University.

So far as the University of Oxford is concerned, the only condition for admission was that prospective scholars should pass the Responsions (*q.v.*) or an equivalent examination. The individual colleges expressed their willingness to accept Rhodes scholars up to a certain number, provided that they passed their entrance requirements. It was the desire of Rhodes that the scholars should be distributed among the colleges. As a general rule, five is the maximum number of Rhodes scholars admitted in one year by any college.

Selection.—The most difficult matter to be settled was the mode of selection, left in the hands of committees of selection appointed in each state or colony. The award of scholarships could not be by competitive examination alone. That was excluded by the terms of the will. Nor could one uniform system of selection be established to cover so wide an area as that provided for, in which different systems of secondary education obtained and students attained maturity at different ages. On the whole, it seemed undesirable to appoint scholars directly from secondary schools, for if the ends aimed at in the will were to be attained, it was desirable to send the scholars to Oxford at an age when they were not too old to adapt themselves to a new environment and not too young to appreciate the advantages and opportunities afforded by the change. The age limits set by the will were nineteen and twenty-five, and these have been generally adopted, with the exception of West Australia (17-25), Queensland and Jamaica (18-25), Newfoundland (18-21), and South Africa (19-21). Candidates were also to be unmarried. It was generally felt that the mode of selection suggested by the will merely defined the qualities desirable in the candidates, and could nowhere be followed in detail. The statement of Rhodes on the subject was as follows:—

"My desire being that the students who shall be elected to the Scholarships shall not be merely bookworms I direct that in the selection of a student to a Scholarship regard shall be had to (i) his literary and scholastic attainments, (ii) his fondness of and success in mainly outdoor sports such as cricket, football, and the like, (iii) his qualities of mind, truth, courage, devotion to duty, sympathy for the protection of the weak, kindness, selflessness, and fellowship, and (iv) his exhibition during school days of moral force of character and of instincts to lead and to take an interest in his schoolmates, for those latter attributes will be likely in after life to guide him to esteem the performance of public duties as his highest aim."

Qualifications.—The general qualifications accepted in most of the colonies and states are the age limits, citizenship, domicile, and the passing of Responsions (*q.v.*). The Responsions examination papers are set and examined by the Oxford authorities, and examination centers conducted under the respective committees of selection are arranged. The exam-

ination is merely qualifying, not competitive. Candidates from such colleges and universities as are affiliated with the University of Oxford are exempt from Responsions.

In the United States the additional qualifications are that the scholars shall have reached the end of the sophomore year at a recognized degree-granting university or college in the country, except in the state of Massachusetts, where the committee of selection may appoint from the secondary schools. Candidates must furnish the committees of selection with certificates of age, and a statement of their educational career, including record in athletics and testimonials from schoolmasters and professors in colleges. The committees of selection are required to interview each candidate personally, except where for special reasons this is not necessary. The arrangements for the admission of elected scholars to the Oxford College are conducted through Mr. Wylie.

The qualifications for election are very similar in the British Colonies. Local qualifications may be imposed, dealing with (1) age (the limits in some cases being changed); (2) residence and domicile (candidates or their parents must have lived in the respective colony for a certain number of years); (3) education (candidates must have attended secondary schools and a specified university either for part or for the whole of a degree course). All candidates must pass the Responsions or be exempted from them under the statute for affiliated colleges.

Rhodes Scholars at Oxford.—At Oxford the Rhodes scholars may enter as undergraduate or postgraduate students and may read for honors or pass degrees. The postgraduate degrees which are open to qualified scholars are Bachelor in Letters, Science, or Civil Law. It is difficult as yet to generalize, but it may be said that up to the present the majority of Rhodes scholars, Colonial, American, and German, have taken up the study of law or jurisprudence, both regarded as excellent preparation for public service. Indeed, this to a large extent carries out the intention of the founder, and the late W. T. Harris (*q.v.*) remarks in his Report for 1902 as Commissioner of Education: "The Rhodes bequest is the most timely of gifts for higher education, because it gives opportunity to begin this education of that class of our population which will furnish our consulates, our home offices, and our embassies with attachés. Out of the most successful of these will come by and by our foreign ministers and our home experts in diplomacy."

"England is the best place in which to begin this work. The excellence of the University of Oxford is without doubt the training of the ready gentleman who cannot be pushed off his feet by an attack directed upon the weaknesses of his personality. His training at Oxford gives him that secure self-possession and self-

RHODES SCHOLARSHIPS

respect which commands the respect of his fellows."

Literæ Humaniores, or the classical school, receives a number of students, but as a rule the previous preparation of non-English schools is inadequate for the demands for this degree. Modern history and English literature also attract a small proportion of the scholars. According to the Report of the Rhodes Trust for 1910-1911, distribution of the Rhodes scholars was as follows: For the degree of B.A., *Literæ Humaniores*, 14; natural science, 18; jurisprudence, 44; history, 18; theology, 10; English literature, 8; mathematics, 6; modern languages, 3; engineering, 5. For advanced or specialized courses: B.C.L., 11; B.Sc., 6; B.Litt., 10; M.B., 10. A number of others were candidates for diplomas. The showing of the scholars has on the whole not been above the average. So far as the American scholars are concerned, the reports of their tutors afford an interesting basis of comparison between the preparation which they have received at home in school and college and the attainment which for their age and standing they are expected to have reached at Oxford. For their energy, industry, seriousness, keenness, and interest the reports have nothing but the highest praise. But the feeling is that on the whole the American scholar is superficial and inaccurate, is a dilettante rather than a close student, is restless and not good at long spells of work, is not clear or precise in expression, and, finally, "knows nothing well, but knows something about a great many things." Of the scholars as men of character with influences for good, the Oxford authorities speak in the highest terms. Many of the Rhodes scholars have distinguished themselves in athletics. In 1907 an American scholar was elected president of the Oxford Athletic Club, and in 1908-1909 out of five representatives in the track meet against Cambridge, four were Americans. Socially it was felt for a time that the Americans kept somewhat to themselves, although at an early meeting it was decided not to form any distinct or separate organizations. It is to be remembered, however, that the American scholars, at any rate, and many of the colonists are a few years above the average age of the Oxford student and that they come up with entirely different traditions. On the whole, barriers tended to break down, and the Rhodes scholar is tending more and more to identify himself with the social life of Oxford and of his college, to form friendships, and to understand the English attitude in just the spirit desired by the Colossus of South Africa.

RHODES, UNIVERSITY OF — Rhodes, owing partly, it is to be presumed, to its central position in the Greek world and its policy of neutrality in Greek politics, became early an important seat of learning; in the last century of the pre-Christian era and the first century A. D. it shared with Athens the distinction of being the most prominent university center in the ancient world and of attracting to its schools the largest number of students. It was from Athens and Rhodes, we are told, that Ptolemy Philadelphus, in the first part of the third century B. C., collected books for the recently established library at Alexandria. Rhodes was also the birthplace of many distinguished men of letters — among others, of the epic poet Pseudo-Homer, of the lyric poet Timotheus, of the comedy writer Alexandrides, of Eudemos, the Peripatetic philosopher, and of Panælius, the Stoic philosopher. The name of Apollonius Rhodius, the author of the *Argonautica*, is inseparably connected with the island, for it was there that Apollonius lived and taught for many years, after he retired from Alexandria. Dionysius Thrax also made Rhodes his home for the greater part of his life.

The studies which were most favored at Rhodes and were chiefly influential in giving celebrity to the island in an educational way were rhetoric and philosophy. According to the tradition, the Athenian orator Æschines, after his defeat at the hands of Demosthenes in the celebrated oratorical contest over the golden crown, retired to Rhodes about 330 B. C. and set up a school of rhetoric there. Whether the study was, as is further stated, thus first established at Rhodes by Æschines or not, it doubtless flourished there from that time onward. We hear little, however, of its course until toward the end of the second century B. C. In the first century B. C. the island was visited by many distinguished Romans, — among others, by Mark Antony, Cæsar, Cicero, Brutus, and Cassius, — who listened to the lectures of the professors and studied in the schools. The most famous of the teachers of rhetoric were Apollonius Molon and Apollonius Molon. The latter was heard by both Cæsar and Cicero, and through Cicero he influenced forcibly the course of Roman oratory. Toward the end of the first century B. C. the rhetorician Theodorus of Gadara was

settled at Rhodes, and his lectures were attended there by Tiberius, who was later Emperor, during the time of the latter's retirement to the island. The Rhodian oratory was said to have a distinctive character and to hold a position midway between the turgid Asiatic style and the terse and chaste Athenian style.

The various schools of philosophy were well represented at Rhodes. The most famous of the philosophers whose names are associated with the island were Pannetius and Posidonius. Pannetius was born at Rhodes, but taught at Rome and Athens. Posidonius, though a native of Apamea in Syria, held his school at Rhodes. While he was nominally a philosopher, his interests extended over many fields, and his lectures dealt apparently with moral philosophy, physical science, and history. His school attracted the Romans in great numbers to Rhodes. Among those who heard him were Cicero and Pompey. Both Pannetius and Posidonius influenced Cicero strongly. On the death of Posidonius his school passed into the hands of his grandson, Jason.

Besides the schools of rhetoric and philosophy there were various other schools at Rhodes, — notably schools of grammar, architecture, painting, and geography. The most important of the grammarians was Dionysius Thrax. In the principate of Antoninus Pius the city of Rhodes was partly destroyed by an earthquake, and it never came into great prominence after that time. J. W. H. W.

RHODESIA, EDUCATION IN.—Rhodesia is administered by the British South African Company. The Company instituted public education in 1890 when a Director of Education was appointed for southern Rhodesia. This Department in addition to the Director now has a clerical staff of three, and three inspectors. Under the Department there are nine secondary schools (including secondary departments), thirteen farm schools, twenty urban schools, 120 native and three colored schools. The schools are supported by the government. There is no training institution for teachers, but bursaries enable women teachers to attend Grey College, Bloemfontein. O. W.

RHYTHM.—The regular recurrence of similar phases of any phenomenon after longer

or shorter intervals. The perception of a series of rhythmical, auditory, tactual, or visual stimuli is attended by a peculiarly agreeable feeling. In many, if not all, such cases, there is a tendency to movements of the muscles of the limbs or throat or other parts of the body in unison with the time of the rhythmical series. The grosser movements of the limbs, as in walking and in swinging the arms, become rhythmical because of the tendency to emphasize one side of the body over the other in muscular performance. Even the more automatic physiological processes occur in various rhythms.

So fundamental is this tendency to rhythm that stimuli which are presented objectively in a perfectly uniform manner become broken up into a series of rhythms in which a subjective emphasis is placed upon the stimuli at regular intervals, as, for example, in listening to the tick of a clock.

It is a well-known fact that rhythm aids in physical work, and experiment shows that the same is true of mental work. In experiments with the ergograph the subjects tend to fall into a regular rate of lifting the weight. Adult writing is characterized by a series of rhythmical movements which distinguish it from the writing of children. It has also been shown that there are periods of greater or less energy throughout a day's or even a season's work which tend to recur rhythmically. The well-known phenomenon of fluctuation of attention is another instance of rhythm occurring in the mental life. Rhythmical tendencies are also present in human speech and often in prose literature. The fundamental character of rhythm is also made evident by the tendency of early literature to take the form of poetry, and by the liking of children for verse where the rhythm is very marked, and also in the pleasure that is derived from dancing and similar forms of rhythmical movements.

RHYTHM.—See MUSICAL NOTATION.

RICE, VICTOR MOREAU (1818-1860).—State Superintendent of Schools; was graduated from Allegheny College in 1841. He taught at Buffalo and was city superintendent of schools there from 1851 to 1854. He was State Superintendent of Public Instruction in New York from 1854 to 1857 and again from 1862 to 1868. He was active in the establishment of normal schools and the abolition of the rate bills, which made the schools of New York free. W. S. M.

RICHARDS, JAMES B.

RICHARDS, JAMES B (1817-1886).—Founder of schools for feeble-minded children; was educated in the public schools of Massachusetts. He was a teacher in Chauncy Hall (Boston), and later was associated with his father-in-law, Samuel G. Howe (*q.v.*), in the organization of a school for feeble-minded children. In 1852 he became the principal of the newly organized Pennsylvania School for Feeble-minded. He was the author of several papers and reports on the care and training of the feeble-minded. W. S. M.

See DEFECTIVES, SCHOOLS FOR

RICHARDS, ZALMON (1811-1890).—Educator, was graduated from Williams College in 1836. He was teacher in the district schools of Massachusetts, principal of academies at Cummington, Mass., and Stillwater, N. Y.; and principal of the preparatory department of Columbian University at Washington. He was one of the founders of the National Education Association (*q.v.*), and its president in 1858. His publications include *Historical Sketch of the National Education Association*, and numerous papers on educational subjects. W. S. M.

RICHELIEU, JEHAN ARMAND, DUC DE (1585-1642).—The educational significance of Richelieu in the history of France is not slight. His aristocratic temper, no less than the enormous constructive work he was called upon to do, prevented him from taking the least interest in the almost complete lack of elementary education; but for higher education he did much. He himself received a scanty education, first, as a young noble, in the Collège de Navarre and Pluvinel's Academy; then, when he was destined for the Church, in the St. John Lateran College. Seeing no escape from the clerical life, his ambition seems to have concentrated on academic and theological distinction, and he became an assiduous student. This led him, when he became a bishop, to press for a reform of clerical education. The majority of his clergy had had no training, and had been submitted to no intellectual tests whatever. He cooperated with Cardinal de Béruille in forming the first seminaries for the education of priests (in the first decade of the seventeenth century), as distinct from the old episcopal schools, which were either transformed or in decay. His breach with the Church put an end to his educational influence among the clergy, but he remained a generous patron of the Sorbonne.

As chief minister of Louis XIII he did nothing for education in the strict sense. Not only was there no demand for it, but his labors in other directions were gigantic. His ideal for the people at large was placid content, with neither too much nor too little money, and did not include instruction. But he did much to foster the higher literary cul-

ture of France in his later years. The influence of the Renaissance in France had been promoted by the coming of the Medici, but retarded by the long feudal and religious troubles. A number of lay writers were now preparing the new culture, and Richelieu, both personally and through his niece, the Duchess d'Aiguillon, was a warm patron of Corneille (with whom he quarreled after a time), Voiture, and the leading writers. His own literary work was poor, but it is clear that he took a genuine interest in the advance of culture. He pressed France to rival the literary supremacy of Spain and Italy, and set a profound and far-seeing program for the Académie Française, which he founded. Hearing, in 1634, that a group of Parisians were in the habit of meeting occasionally for a modest discussion of letters, he pressed them to form a *corps*, or legal corporation, enlarged their numbers, and became first president of the new Academy. The task he set them was to forge the language, which was then very imperfect and erratic, and make it a finer implement. They were to create a standard Dictionary, Grammar, Rhetoric, and Poetic. Richelieu did not live long enough to see the famous Dictionary completed, and the rest of his program was abandoned. Hallam describes the Academy as "the most illustrious institution in the annals of letters." J. Mc. C.

RICHMOND COLLEGE, RICHMOND, VA.—An institution established by charter in 1840 by a body of trustees to whom was transferred the Virginia Baptist Seminary, founded in 1832 by the Virginia Baptist Education Society for the training of ministers. The work consisted at first of two years of preparatory and of two years of college work; a junior class was added in 1846 and a senior class in 1848. Work was suspended during the Civil War, but was renewed in 1866. In 1872 a memorial fund was collected, and buildings were erected. A new library and museums were established, and commercial and law departments were added. Women were admitted to the liberal arts classes in 1898. Ten years later the College began to cooperate with the Virginia Baptist Education Commission in collecting funds for the establishment of a Woman's College under the control of the trustees of Richmond College. A conditional grant of \$150,000 was also made by the General Education Board, and this sum is to be the nucleus of a fund for the further extension of the equipment and instruction of the

College. Collegiate work, for entrance to which fourteen units of high school work are required, is given, leading to the degrees of B.A. and B.S. A school of law giving two years' work leading to the LL.B. degree is also maintained. The enrollment of students in 1910-1911 was 336. There is a faculty of twenty-two members.

RICHTER, JOHANN PAUL FRIEDRICH, "JEAN PAUL" (1763-1825).—The great German humorist, born in Wunsiedel, Bavaria, was the son and the grandson of schoolmasters. His father became later a pastor, a calling for which the son undertook training at the University of Leipzig. Theology lacking in interest, he turned his attention to the study of literature. His plans suffered change, owing to the needs of his widowed mother. During several years he taught, first serving as a family tutor, and later conducting a private school with seven pupils. Although he had a firm hold on these charges and struggled to teach them as he conceived his office, formal instruction was notably wanting. His literary activity asserted itself during these early days of struggle with poverty and elusive fame as an author. The peculiarities of his style and the oddity of ideas at first delayed the reception of his writings, and eventually won for him the German characterization of "Jean Paul, der Mühsige." He finally settled at Bayreuth and devoted his time to writing, showing a remarkable productivity which filled some sixty volumes. Among these may be mentioned *Quintus Fixlein* and *Maria Wutz* as bearing on education. With all his dreaming and fantastic traits he possessed a rare power in describing childhood and youth.

His chief consideration of the problems of education is found in *Lorenz*, or *the Doctrine of Education* (1807). Adopting for the title the Roman goddess of newborn children, he wrote out of his experiences, as a teacher for the benefit of parents, especially mothers. In spite of its subtitle, the book is not a systematic treatise, nor is it a popular work. He criticized Rousseau's *Emile* as a negative, immoral, and futile scheme, but accepted the humanizing point of view of this reformer. With a tender regard for childhood, he would break the bondage of the schoolroom in order to give their early life a joyous freedom. In detecting the great educative functions of play, dancing, games, music, and fairy stories, he became a forerunner of Froebel and the kindergarten. Punishment is an "unchildlike word." Because of his keen appreciation of woman's nature, the treatment of female education is one of the most valuable parts of the book. Physical and moral education receive attention. Religious teaching is to proceed without catechisms, formulas, and attendance on worship. He reminds one of Locke in the little space given to intellectual

education or instruction. With criticisms for the "classical parrots," he urges the vernacular as the true subject matter of instruction. The work closes with a dream of the "Paradise of Children." *Lorenz*, not written for pedagogues, and supported by his literary reputation, reached a wide culture group and gave permanent service in the humanization of education in the nineteenth century. Many of his ideas, in the form of aphorisms, have passed into the common language of education. "The art of education ought to aim at a standard of elevation superior to what may happen to be the spirit of the time—for the child is to be educated not for the present merely." "The spirit of education is nothing more than an endeavor to liberate by means of a freeman, the ideal human being which lies concealed in every child." "To write upon education means to write upon almost everything at once, for it has to care for a microcosm of the microcosm." "The best and most complete education cannot exhibit its true power upon one child, but upon a number of united children." E. F. B.

RICKETS—A complex disease characterized by constant lesions in the bones and disturbances of nutrition. It is a matter of dispute whether the changes in the bones are of an inflammatory nature or the result of disordered nutrition; but the general opinion is that the cause is a lack of proper food, with hereditary tendency. The disease occurs most frequently from the sixth to the twentieth month of life and affects both sexes equally; it occurs more frequently among certain races, for example, the negroes and the Italians; is much more frequent and more pronounced in the case of the poor than in the case of the well-to-do, and more frequent in the city than in the country; the phenomena of rickets are at their maximum toward the end of the winter, at a minimum in autumn; and the disease is more frequent in the temperate zones than in the tropical and subtropical countries or the extreme north. Rickets is said to occur seldom in white children on normal breast feeding; it is rarely absent in babies

RICKOFF

fed for a long time exclusively on proprietary food without fresh milk. Its significance for school hygiene lies in the fact that school children who have suffered from rickets as infants are more liable to develop spinal curvature, flat foot, and the like, and hence should receive special care during the school period with regard to diet, posture, physical exercise, and general hygienic surroundings.

RICKOFF, ANDREW JACKSON (1824-1899). — School superintendent; educated at Woodward College, Cincinnati. He was superintendent of schools at Portsmouth, Ohio, principal of schools at Cincinnati; and from 1867 to 1882 superintendent of schools at Cleveland. He was the author of a series of arithmetics and many papers on educational topics. He was president of the National Education Association in 1859.

W. S. M.

RIDDING, GEORGE (1828-1904). — English bishop and head master of Winchester College, who undertook the difficult task of reforming and giving new life to the oldest and most famous and most conservative of the Great English Public Schools. Ridding, whose father was second master at Winchester, was a scholar of the College from 1840 to 1846. Although "head of the roll" for New College, he was ousted from his scholarship by two founder's kin. He went to Balliol College instead and obtained a first class in classics, the Craven scholarship, and a mathematical fellowship at Exeter College. In 1858 he married the daughter of Dr. Moberly (q.v.). In 1863 he was appointed second master at Winchester and three years later he was elected head master. He at once devoted himself to reforms. He imported a first-class mathematician and scientist, George Richardson, from Cambridge, and made both mathematics and science a reality. In his own teaching of classics he broadened the area by the introduction of the writing of English essays, the study of English history, and the placing of Chaucer and Bacon side by side with Vergil and Cicero. But his great changes were the enlargement, amounting to re-creation, of the site and buildings. Four new houses of thirty boys apiece, under as many new masters, were substituted for the unsanitary barracks, called "Commoners"; and the scholars' chambers, in which they both worked and slept, were doubled by the annexation of the nonresident fellows' chambers above these, so that they now worked in one and slept in another. The other change, even more important in its results to the school

RIESE

life, was the extension of "Mends," Ridding buying up land and making alterations out of his own pocket.

The result of these changes, on which Ridding spent some £20,000 of his own money, and of the fame of his broad views shown in every department of education and school life was that the numbers in the school rose from 271 in 1866 to 420 in 1871, at which it was fixed as being as large as one man could personally know and govern. When in 1884 Ridding retired to the organization of the new bishopric of Southwell, which for twenty years he governed with the same breadth of mind and generosity, he left Winchester with the reputation of the premier school of England for scholarship and morale, while of himself the old Warden of New College, who had been opposed to most of the reforms, confessed that for them he deserved the title of *Wykehamus alter*.

RIDPATH, JOHN CLARK (1840-1900). — Author of school histories, was graduated from De Pauw University in 1863. He was instructor in academics in Indiana and professor in De Pauw University. He wrote a series of school histories and numerous popular historical works.

W. S. M.

RIESE (also RIES, RYS, RYSE), ADAM (1492-1559). — German Rechenmeister, born at Staffelstein, near Bamberg. He was the author of the best known textbooks in arithmetic in the sixteenth century and his popularity is evidenced by the current German saying "*nach Adam Riese*" (cf. "according to Cocker" in English). Riese was a teacher of arithmetic at Erfurt in 1522, and in 1525 at Annaberg, where he also served as bookkeeper at the mines. He was the most influential of all the Germans in replacing counter reckoning (*auff der Linien*) by the written computations (*auff Federn*). He wrote three textbooks: (1) *Rechnung auff der linihen gemacht durch Adam Riesen von Staffelstein, zu massen man es pflegt zu lern in allen rechneschulen guntlich begriffen anno 1518*, a work on reckoning on the line abacus. (2) *Rechnung auff der Linien und federn (in zal, mass und gewicht) auff allerley handierung gemacht (und zusammen gelesen) durch Adam Riesen (von Staffelstein), Rechenmeister zu Erfurd in 1522. Jar*. This was a shorter textbook than the first, with the addition of written computations. (3) *Rechnung nach der Lenge auff den Linien und Feder. Dazu forteil und behendigkeit durch die Proportionen Practica genant Mit*

RIGHT-HANDEDNESS

gründlichen Unterricht des visiers. Durch Adam Riesen in 1550 Jar. This is the best known work, and, while making no new contribution, supplies a useful arrangement of existing material. Work with counters precedes exercises with figures, the simpler arithmetical operations are placed before the more complex; and drill and practice are insisted upon. In another work, *Ein gerechtes Büchlein auff den Schöffel, Eimer und Pfundt gewicht* (1533), Riese gives a number of tables for ready reckoning and the Annaberger Brodordnung, giving the fluctuations in the weight of bread according to the fluctuations in the price of wheat.

RIPLEY, GEORGE (1802-1880) — Founder of the Brook Farm Institute of Education and Agriculture (afterwards incorporated into the Brook Farm Phalanx); was graduated from Harvard College in 1823 and from the Cambridge Divinity School in 1826. He was tutor at Harvard for a year and then continued his studies in Europe. He engaged for a time in the ministry, and in 1841 he began the Brook Farm experiment. Two hundred acres of land were purchased at Roxbury (near Boston)

The aim of the association was "to establish an agricultural, literary, and scientific college, where a pure religious and moral life could be lived." After the failure of the experiment (1846), Mr. Ripley engaged in teaching on Long Island. He was editor of the *American Cyclopaedia*, coeditor with Charles A. Dana of the *New American Cyclopaedia*, and joint author with Bayard Taylor of *Handbook of Literature and Fine Arts*. W S M.

RIPON COLLEGE, RIPON, WIS. — A coeducational institution incorporated Jan. 20, 1851. No college classes were formed until the autumn of 1863, when the Rev. William E. Merriam was elected to the presidency, and the college grew rapidly and substantially. The administration of Edward H. Merrill, D.D., LL.D., began in 1870, and continued until 1891. Rufus Cushman Flagg, D.D., was president from 1892 to 1900, Richard Cecil Hughes, D.D., from 1901 to 1909; Silas Evans, A.M., D.D., 1910. The entrance requirements to the College are fifteen units of high school work. The college courses lead to the degrees of A.B. and A.M. Special preparation is given for teachers and for entrance to the professional studies of law and theology. A school of music is also maintained. The faculty in 1910-1911 consisted of twenty-six members, and the student enrollment was 230. S E.

rites and ceremonies. — See PRIMITIVE SOCIETY, EDUCATION IN; INDIANS, NATIVE EDUCATION OF.

RITSCHL, FRIEDRICH (1806-1876). — Classical scholar and philologist, born in Thüringen, and educated at Erfurt, Wittenberg, Leipzig, and Halle. His earliest interests and contributions were mainly in Greek literature and antiquities. He taught at Halle (1865-1876). His best known work is an edition of Plautus, with commentaries based on the famous Ambrosian palimpsest at Milan; nine plays appeared between 1818 and 1854, other plays being edited by his pupils. His studies of Plautus led him into researches on the history of the Latin language and inscriptions, of which he made a collection (*Præce Latinitatis monumenta epigraphica*, 1802). Further studies and papers deal with the laws of Saturnian verse, the works of Varro, the recent history of classical philology, and the modern pronunciation of Latin, etc. Ritschl was a successful teacher and trained a number of scholars who continued his work.

RITTER, KARL (1770-1860). — The founder of modern geography, born in Quedlinburg

in the present province of Saxony. At an early age he lost his father and was carefully educated by his mother, a woman of rare intelligence and character, with the help of the well-known educator, Guths Muths (q.v.). In 1784, when Salzmann (q.v.) founded the famous educational institution of Schnepfenthal, he accepted the talented boy as one of his first pupils. Guths Muths at the same time entered the institution as a teacher, and continued to direct Ritter's education until the latter, in 1796, entered the University of Halle to prepare for the teaching profession. Ritter very early showed a great interest in geography, and had the good fortune to have his interest stimulated by the instruction of Guths Muths, who taught this science in accordance with the ideas of Rousseau and of the Philanthropists. After spending three semesters at the University of Halle, Ritter became the tutor of the sons of the Frankfurt banker, Bethmann-Hollweg. With his pupils he traveled through Switzerland, France, and Italy. In 1807 he spent several weeks with Pestalozzi at Yverdon, and in the same year he met the great naturalist and traveler, Alexander von Humboldt. From 1813 to 1819 he lived in Göttingen, where his pupils (one of whom later became the Prussian Minister of Education) attended the University. There he produced his great work *Die Erdkunde im Verhältnis zur Natur und zur Geschichte des Menschen* (Geography in relation to nature and to the history of man, 2 vols. Berlin, 1817-1818), which attracted general attention and procured for him the professorship of geography at the University and the War College of Berlin. He entered upon this work in 1820, and from then until the time of his death he remained active in the teaching and the promotion of geographical science. His scientific productions, most of which appeared in the *Proceedings* of the Berlin Academy of Sciences and of the Geographical Society, the latter founded by himself, were vast and comprehensive, but his chief influence was exerted through his lectures. Ritter's great service to geography consisted in his new conception of the science as the connecting link between the sciences of nature and the sciences of man. He showed how the study of history must rest on that of geography, and the great attention paid to physical geography in our schools to-day is due to his influence. In America his ideas have been made familiar through the writings of Guyot (q.v.) and his successors. Among his works must first be mentioned the second edition of his *Erdkunde* (1822-1858), the first volume of which treated of Africa. The work was, however, expanded to such an enormous degree that in spite of the appearance of eighteen more volumes it remained a torso, only the different countries of Asia being treated. Parts of it, such as the geography of Palestine, have been trans-

lated into English by W. L. Gage (London, 1867).

Of particular pedagogic interest are his *Letters on Pestalozzi's Method, applied to Scientific Education* (1807) and *Some Remarks on a Methodical Instruction in Geography* (1806). The latter of these shows how early Ritter formulated that clear conception of the nature of geography which he kept throughout his life. His lectures on the *History of Geography and of Discoveries*, on *General Geography*, and on *Europe* were published after his death. In honor of his memory two "Karl-Ritter-Foundations," one at Berlin and one at Leipzig, have been founded. Their object is the promotion of geographical knowledge through aid given to explorers and scientific investigators. F. M.

RITTERAKADEMIEN. — See ACADEMIES, COURTLY, GENTRY AND NOBLES, EDUCATION OF.

RIVALRY, RETINAL. — A phenomenon of binocular vision. When an object not too far from the eyes is fixated, the right eye receives a slightly different impression from that of the left, due to the different positions of the eyes in the head. If, then, as in the stereoscope, any images so differing are simultaneously thrown on the foveæ of the two eyes respectively, they will combine into an impression like that of the original object. This is called stereoscopic vision. If, however, the two images are very different (as, for instance, a red and a blue circle or a series of vertical and one of horizontal lines) so that they do not normally combine into any single familiar object, first one of the images will be seen and then the other, that is, instead of binocular retinal fusion, there is a binocular retinal rivalry. The rhythm with which the rivalry proceeds and the length of time that either image persists are determined by a variety of factors, such as the relative intensity of the impressions, their relative complexity, etc. It is probable that the immediate physiological cause of the change from one image to the other is inadvertent eye movements. R. P. A.

RIVERS

RIVERS, RICHARD HENDERSON (1814-1891). — College president; was graduated from La Grange College, Alabama, 1835. He was professor at La Grange College from 1835 to 1843 and president of the college from 1854 to 1865. From 1819 to 1851 he was president of Centenary College, Louisiana. His publications include *Mental Philosophy* (1860), *Moral Philosophy* (1866), and *Our Young People* (1880). W. S. M.

ROANOKE COLLEGE, SALEM, VA. — An institution for men established in 1853 and since then continuing its work without intermission. In addition to the regular college work a business course is conducted. The entrance requirements are fifteen units of high school work. The last two years of the college course, which leads to the A. B. degree, is arranged in five groups. The M. A. degree is also conferred by the college. The enrollment of collegiate students in 1911-1912 was 107, the faculty consists of nineteen members. J. A. M.

ROBERT COLLEGE, CONSTANTINOPLE, TURKEY — An institution for the higher education of the native races of the Turkish Empire. The idea of its foundation was conceived by Dr. Cyrus Hamlin, D.D., LL.D. (q.v.), who interested Christopher R. Robert of New York in 1860. The two raised funds to which Mr. Robert contributed largely and the college was opened in a rented house at Bebek on the Bosphorus in 1863. In 1864 the trustees of Robert College of Constantinople were incorporated in the state of New York and the College became a part of the University of the State of New York. Official recognition was given to the College by an irade granted in 1866 by the Sultan. In 1871 it was moved to its present site on the heights of Roumel Hissar. The aim of the founders of the College was "a model Christian College, in which the first object is the development of Christian manliness in the students through the cultivation of the spiritual as well as the intellectual life." Preparatory and collegiate departments are maintained. Pupils are admitted to the preparatory department at the age of ten and to the subfreshman class of the collegiate department at fourteen. The usual courses, with English as the medium of instruction, are given and lead to the A. B. and B. S. degrees. The students are drawn from the whole of Eastern Europe and represent fifteen nationalities. Robert College has educated about 3000 students since its foundation, and has an annual enrollment of about 350 students. There is a faculty of thirty-six members.

ROBINSON, HORATIO NELSON (1806-1867). — Textbook author, studied at Prince-

ROCHESTER, UNIVERSITY OF

ton, was instructor of mathematics at the United States Naval Academy (1825-1835); author of *Elementary Algebra* (1846), *University Algebra* (1847), *Astronomy* (1849), *Geometry and Trigonometry* (1850), *Mathematical Operations* (1851), *Analytical Geometry* (1861), and several works on arithmetic.

W. S. M.

ROCHESTER THEOLOGICAL SEMINARY, ROCHESTER, N. Y. — Founded by the Baptist denomination in 1850 to train young men for the Christian ministry. The regular course of three years covers the literature of Old and New Testaments in Hebrew, Greek and English, systematic theology, church history, Christian ethics and pastoral theology, homiletics, eloquence and sacred oratory. Courses are given in church music and in religious pedagogy. An extensive elective system adds about forty courses to those of the prescribed curriculum. Practically all students are college graduates. A German department, established in 1852, furnishes elementary as well as more advanced instruction, in a course of six years. Rev. Augustus H. Strong, D.D., LL.D., completed forty years of service as president, in May, 1912. At present there are fifteen men on the two faculties. The material assets are beyond two million dollars, of which \$1,700,000 are productive. The student number about 150 annually. J. W. A. S.

ROCHESTER, UNIVERSITY OF, ROCHESTER, N. Y. — Was founded in 1850. Its establishment was the result of two different movements, a local demand for an unsectarian college, and an attempt to remove to Rochester the Baptist college at Hamilton, N. Y., now Colgate University. The removal plan was thwarted by the advocates of a strictly denominational education. Thereupon leading citizens of Rochester secured from the legislature a new charter to replace the charter of 1846, which had been permitted to lapse during the removal controversy, and elected a board of trustees. Instruction was begun in November, 1850. Although the college owed its existence largely to the efforts and gifts of Baptist clergymen and laymen, its charter prescribed no denominational test for trustees or professors. The progressive policy of its founders was further shown in the remarkable "Plan of Instruction," which was about twenty years in advance of current ideas in its emphasis upon modern languages, science, and a limited election of studies during the latter half of the course. The University of Rochester maintains only courses leading to the degrees of bachelor of arts and bachelor of science. Its first president (1853-1888) was Martin Brewer Anderson, an educator of commanding personality. He was succeeded by David Jayne Hill (1888-1890), later Ambassador to Germany, and Rush

Rhees (1000). The college has a campus of twenty-four acres, nine buildings, including new laboratories for pure and applied science, a library of 60,000 volumes, and excellent museums of geology and mineralogy and zoology, the buildings and grounds are valued at \$870,000 and the productive endowment at \$942,000. The faculty numbers thirty-four and the students (1012) 427, of whom 161 are women
J. R. S.

ROCHOW, FRIEDRICH EBERHARD VON (1734-1805).—German nobleman and educator, the son of a Prussian Minister of State, educated privately and at the *Ritterakademie* at Brandenburg. In 1749 he entered the army with which he remained until 1757, when he retired to Leipzig. Here, through the friendship of Gellert, the poet, he continued his education in many fields, and became interested in the chief philosophical movements of the period. In the following year he decided to take up the administration of his estate at Reckahn and was thus brought into immediate contact with the material and spiritual needs of the country people. These were particularly emphasized in 1771 and 1772, when the countryside was devastated by disease and famine. After some thought, Rochow determined that the only solution must come through the schools, and in 1772 he wrote *Versuch eines Schulbuches für Kinder der Landleute zum Gebrauch in Dorfschulen* (*An Attempt at a Schoolbook for Children of the Country People for the Use of Village Schools*) in which he pleads for better educated and better paid teachers. Rochow was a strong advocate of the catechetical method of instruction and introduced it into all the schools on his estates. He established schools at Reckahn, Gellin, Krahn, and other villages, and rebuilt the school at Reckahn. To this school he appointed in 1772 Heinrich Julius Bruns, who had been in his household as musician and secretary, and was now organist and choirmaster at Halberstadt Cathedral. The two, taking turns as teacher and pupil, elaborated the catechetical method and acquired considerable facility in its use. The principles discovered were embodied in *Instruktion für die Landschullehrer* (*Manual for Country School-teachers*, 1773). The school soon acquired fame through the untiring energy of Bruns and was visited by more than 1000 persons until 1787. Rochow attempted to secure government aid for his schools in order to abolish fees and increase the salaries of his teachers. He secured a small grant which was of some assistance. In 1773 he published a reader (*Bauernfreund*), which was sold on his estates by an invalid soldier. This work was expanded and published in 1776 as the *Kinderfreund*, one of the earliest children's readers, which quickly went through four editions of 100,000 copies, and twelve

unauthorized editions, and was translated into a number of foreign tongues. A second part appeared in 1778. The curriculum in his schools went beyond the three R's and included singing, nature study, object teaching, and religious instruction. Although strongly religious, Rochow was no believer in religious formalism and frequently emphasized the social importance of religious instruction. He insisted in the classroom on an appeal to intelligence, and, when possible, to sense-perception, and for that reason believed in the catechetical method, which allowed the pupil as well as the teacher to ask questions, as opposed to learning by rote. In 1779 he wrote the *Handbuch der catechetischen Form für Lehrer die aufklären wollen und dürfen* (*Manual of catechetical method for Teachers who wish and should enlighten*),—a plea for enlightenment of the lower classes as well as a work on aim and method. Rochow was a prolific writer on educational subjects and was keenly alive to the educational questions of his day. He was a friend and supporter (for a time) of Basedow (*q.v.*) and sent some boys from his estate to Dessau to be trained for teaching. He was in correspondence with Baron Von Zedlitz, the Minister of State. He was a strong influence in advancing the movement for the training of teachers and took an active and personal interest in the Seminar established by the Cathedral Chapter at Halberstadt. He recognized that national progress depended on the schools and the schools on able teachers, and so far was he from trusting the education of children to the church that he held that "children belong to the state, it is the will of the state that they be educated and learn to read, write, cipher, and to think properly." To this end he wrote, in 1770, *Verbesserung des Nationalcharakters durch Volksschulen* (*Improvement of National Character through the Public Schools*), and in 1792 translated Mirabeau's *Discourse on National Education*. In 1795 he wrote a *History of my Schools* (*Geschichte meiner Schulen*). Rochow's influence was for a time extensive and marked an era in the provision of education for the countryside. It declined, however, before the rapid and widespread influence of Pestalozzi for whose ideas Rochow had prepared his country.

ROCK HILL COLLEGE

ROCK HILL COLLEGE, ELLICOTT CITY, MD — A school of the Christian Brothers (*q.v.*), founded in 1857 by the purchase of Rock Hill Academy, a private institution opened as early as 1800, and by the removal of a school, Calvert Hall, maintained by the Brothers in Baltimore from 1843. The academy was incorporated as Rock Hill Institute in 1862 and as Rock Hill College in 1865. The most noted of the presidents has been Brother Azarias (see MULLANY, PATRICK FRANCIS).

See CHRISTIAN BROTHERS.

ROCKEFELLER, JOHN D., GIFT TO GENERAL EDUCATION BOARD. — See GENERAL EDUCATION BOARD; see also CHICAGO, UNIVERSITY OF.

ROCKFORD COLLEGE, ROCKFORD, ILL. — Founded in 1849 to provide for the higher education of young women. The collegiate course of study was not added to the Seminary curriculum until 1882. In 1891 the Seminary course was discontinued, and in 1892 the name of the institution was changed from Rockford Seminary to Rockford College. Beginning with the class of 1896, all graduates of the institution have been college graduates. In 1909, the preparatory department was discontinued. Courses in home economics, secretarial work, and teaching have been introduced. These may occupy about one fifth of the entire time devoted to college work. The present enrollment is between two and three hundred students. The total number of baccalaureate graduates is about four hundred. Many among them are prominent as teachers, missionaries, lawyers, editors, and physicians, among the most prominent being Miss Jane Addams of Hull House. The faculty numbers thirty-two. The college courses lead to the degrees of A.B. and D.S., respectively. Each represents four years of preparatory study, corresponding to the high school course, and the four years of collegiate study. Rockford College is the only woman's college between New York State and California accorded the first rank in scholarship by the United States Commissioner of Education, and, with the exception of Mount Holyoke (*q.v.*), stands as the oldest of these colleges. J. H. G.

ROEBUCK, JOHN ARTHUR (1801-1879) — English politician, born in India and educated in Canada. In 1831 he was called to the English bar. In 1832 he became Member of Parliament for Bath and proved a strong progressive in politics. In education his advocacy of a national scheme of education in 1833 is noteworthy. He attacked the problem from the point of view of the growing democracy and in the interests of good government. "I wish them (the people) to be enlightened in order that they may use the

power well which they will inevitably obtain." He recommended the appointment of a high state official, a member of the Cabinet, to take charge of the system which he proposed. The country was to be divided into school districts with their own school committees. School attendance was to be compulsory for all children between the ages of six and twelve. Two types of schools were to be established — infant schools to teach the three R's, and schools of industry to give general instruction and special trade preparation. Importance was to be attached to the teaching of those subjects which provide the means of enjoyment. "Education means not merely these necessary means or instruments for the acquiring of knowledge, but it means also training or fashioning the intellectual and moral qualities of the individual, that he may be able and willing to acquire knowledge, and to turn it to its right use." In the towns evening and Sunday continuation schools might be provided for those who wished to attend. Finally, normal schools would be necessary to train teachers for the schools. The cost of education and maintenance of schools was to be provided out of tuition paid by those who could afford it and from a general tax. Roebuck was largely inspired by acquaintance with contemporary changes in French education and Victor Cousin's report on Prussian schools. A national system of education was not established in England at the time, but it may be that the first education grant was an indirect result of Roebuck's appeal. Roebuck was always an advocate of secular schools and both in 1833 and 1843 expressed himself to that effect in Parliament. Roebuck remained in close connection with Bath until he was rejected as its member in 1847. In 1849 he became member for Sheffield, with which, excepting a brief interval, he was connected until his death. His attention was, however, given up mainly to questions of foreign politics.

ROLL OF HONOR.—See COLLEGE, AMERICAN, UNDER ADMINISTRATION OF THE COLLEGE CURRICULUM; JESUS, SOCIETY OF; EDUCATIONAL WORK OF; PUNISHMENTS AND REWARDS.

ROLLAND D'ERCEVILLE, BARTHÉLEMY (1734-1794) — French statesman, advocate, and parliamentarian. Although not primarily interested in education, his *Compte-rendu*, presented to the Parliament of Paris in 1788, was a real treatise on that subject. The expulsion of the Jesuits (*q. v.*) from control of their various institutions of learning in France had wrought havoc in the teaching force of the secondary schools all over the land. This parliamentary report was in part intended to meet this situation, but incidentally it discussed many fundamental educational questions. He pleaded for a more extensive study of history, especially in its national aspects, he insisted that the study of the native language should be as dignified as that of Latin; he wanted special teachers of the mathematical and physical sciences appointed, instead of intrusting this scientific instruction to the philosophers, and he demanded universal education, at least to the extent of reading and writing, and the adaptation of instruction to the needs of the various classes. On the administrative side he proposed the establishment of a normal school for the preparation of teachers; and he suggested the highly centralized scheme of educational control that was adopted by Napoleon in his organization of the Imperial University in 1808. Aside from the *Compte-rendu*, cited above, should be mentioned his *Recueil de plusieurs ouvrages sur l'éducation* (1783), *Plan d'éducation* (1784); *Recherches sur les prérogatives des dames chez les Gaulois* (1787).

ROLLIN, CHARLES (1661-1741) — French historian and educator. He is a striking instance of a poor boy who forced his way up from the bottom. Although at one time a menial in the Collège du Plessis, he

ROMAN CATHOLIC CHURCH

later rose to be a master in the college when only twenty-two years of age. He was professor in the Collège de France from 1688 to 1736, was three times chosen rector of the University of Paris, 1694, 1695, and 1720, and was head of the Collège de Beauvais from 1690 to 1712. Here he performed his most telling work, raising this institution from a very lowly to a high position among the university colleges. He instituted important reforms in the curriculum, infusing modern ideas into the study of history, and he was a leader in the movement to replace Latin by the vernacular. Although long accustomed to write in the classical language, he set the example by writing thenceforth in French, no fewer than twenty volumes issuing subsequently from his pen. While his *Histoire ancienne* (13 vols., Paris, 1730-1738) is his most famous work, yet to the student of education his *Traité des études* (1726-1728) is far more important, especially in view of the light it throws upon the educational conditions in the Paris colleges of his day. Among his more important works are *Histoire ancienne*, *Histoire romaine*, 10 vols., volumes 8-16 being continued by Crevier (Paris, 1748), *Œuvres complètes*, edited by Letronne (30 vols., Paris, 1821-1830).

ROLLINS COLLEGE, WINTER PARK, FLA. — Established by the Congregational Association of the state, in 1855, but entirely undenominational in spirit and control. There are eight departments: the college, the academy, and the schools of music, expression, fine arts, domestic and industrial arts, teaching, and business. It has a campus of twenty-five acres, twelve buildings, twenty instructors, about two hundred students, and nearly one quarter million dollars of endowment. Its standards of admission and graduation are the same as those of the classical colleges of New England and the West.

ROMAN CATHOLIC CHURCH AND THE PUBLIC AND PAROCHIAL SCHOOLS.

— For the historic relation of the church to education in the past see a great variety of topics, especially CHURCH SCHOOLS; BISHOPS' SCHOOLS; articles on the Church Fathers; CANON LAW AND EDUCATION, ABBEY SCHOOLS, CHRISTIAN EDUCATION IN THE EARLY CHURCH; MIDDLE AGES, EDUCATION IN; MONASTIC EDUCATION; and the articles on the various Monastic Orders, e.g. BENEDICTINES, DOMINICANS, FRANCISCANS, JESUITS, etc. For the contemporary relation of the Church to educa-

tion see the articles on the various national systems, RELIGIOUS EDUCATION, etc. The article on CONVENT SCHOOLS gives a survey of existing systems of the various monastic teaching orders. For the legal aspect of religious education in the schools of the United States, see *LITTLE IN THE SCHOOLS*. The following articles deal only with the present-day aspects of the problem.

In the course of its development, American public education has steadily diverted itself of specifically religious elements, and become more secular in character. The general view is that this has not been due to growth of irreligion, but to the same causes which made government nonsectarian in character. The variety of denominations has made it necessary to have public education, like public administration of other sorts, confine itself to functions not subject to partisan dispute. Prayers, catechetical exercises, and Bible readings have tended to disappear from the activities of the public schools (see *BIBLE IN THE SCHOOLS*), though the atmosphere, owing to the character of the teachers, has remained distinctly moral and even religious in a broad sense of that word.

The supporters of the public school, therefore, have fostered its development for secular studies. They have contended that in the teaching of reading, writing, history, literature, geography, mathematics, and manual arts, there need be no sectarian or religious element; that if the teachers were morally upright and earnest, the total effect upon the child would be good. They felt that if the school claimed the child for only 200 days of five hours each per year, it was entirely possible for the various churches to procure suitable religious training in the remaining time. Rarely have the supporters of the public school been opposed to religious teaching as such; they have recognized the difficulty, if not impossibility, of giving it under public school conditions, and have, therefore, sought to have public school time reserved for studies about which there was no dispute.

But many religious people, and conspicuously the Roman Catholics, have claimed that education is essentially a unitary process, incapable of subdivision as above indicated.

This question has been the subject of public controversy in the past, and is of current importance in European countries. A few years ago it became a subject of great practical importance in Wisconsin, Minnesota, and in Manitoba (see *MANITOBA SCHOOL CASE*). It is possible that the question may be one demanding public attention in the future. So many supporters of the exclusive public system of education are so uninformed concerning either the principles or the activities of the chief supporters of the parochial school idea, that it is desirable to have both a clear formulation of positions upon which this ad-

vocacy is based and a summary of present attainments. P M

See also LUTHERAN CHURCH AND EDUCATION

Present Position of Roman Catholic Church and Schools.—The Catholic church has always maintained the religious principle in education. Her charter as a teaching institution is clearly laid down in the words of Christ to His Apostles: "Go therefore, teach ye all nations—and behold I am with you all days, even to the consummation of the world," Matt., xxviii 19, 20. While this divine commission refers primarily to the doctrine of salvation, and therefore to the imparting of religious truth, it nevertheless, or rather from the very nature of that truth and its consequences for life, carries with it the obligation of insisting on certain principles and maintaining certain characteristics which have a direct and decisive bearing on all educational problems. The Catholic church consistently holds that life here gets its highest value by serving as a preparation for the life to come. She insists that no education is complete which leaves out of consideration the ultimate purpose of life, and hence that no education is "a preparation for complete living" which ignores or sets aside that ultimate purpose. It is just this completeness—in teaching, in harmonizing all truth, in elevating all human relationships, in leading the individual soul back to the Creator—that forms the essential characteristic of Christianity as an educational influence. The Catholic church has laid down these principles: (1) intellectual education must not be separated from moral and religious training. To impart knowledge or to develop mental efficiency without building up moral character is not only contrary to psychological law, but is also fatal to both the individual and society. No amount of intellectual attainment or culture, she holds, can serve as a substitute for virtue. (2) Religion should be an essential part of education; for on it morality is based; with the Catholic church the maxim prevails: "no religion, no morality, no morality, no government;" hence religious instruction should form not merely an adjunct to teaching in other subjects, but should be the center about which these are grouped and the spirit by which they are permeated. Sound moral instruction, she holds, is impossible apart from religious education. Such training furnishes the strongest motives for conduct and the noblest ideals for imitation, while it sets before the mind an adequate sanction in the holiness and justice of God. Such an education, which unites the intellectual, moral, and religious elements, is the best safeguard for the individual and the most effectual preparation for citizenship and the discharge of social duties. According to the Catholic view the welfare of the state demands that the child should be trained in the practice of virtue and

ROMAN CATHOLIC CHURCH

religion no less than in the pursuit of knowledge.

The Catholic church has always laid down and followed these vital principles of education. She has laid them down not only for the elementary schools, but for the higher schools—the colleges and universities. She has never wavered; she has never recoded, and she never will, and that because of the view she holds of education. For education, she maintains, is the formation of the whole man—intellect, heart, will, character, mind, and soul. Whether it be the child of the artisan in the parish school or the son of the millionaire in the university, it is all the same. She will accept as education nothing less than the formation of the whole man. She will never consent that her children shall be reared without the knowledge of her faith, or that education shall be so divorced that secular knowledge shall be made the subject of daily and earnest inculcation and that religion shall be left out as an accident, to be picked up when and as it may. The Catholic church holds that a Christian nation can spring only from Christian schools, and that neither private zeal, nor home education, nor the Sunday school suffice to supply the Christian teaching and formation of character which she desires in her children. It is because of this settled conviction that at all costs and at great sacrifices she preserves here in the United States the unbroken and unimpaired tradition of Christian education from the parish school of the humble mission to the numerous colleges and universities that she has established throughout the country.

When the Catholic bishops of the United States met in the third plenary council of Baltimore, in 1884, one of the most important questions they had to discuss and legislate upon was the subject of parish schools. Laws and regulations for the establishment and management of these schools were laid down with great care and definiteness. In every parish, where it was possible, a school was to be established. Catholic parents were directed to send their children to these schools. The local rector was urged, as well as the teachers, to make these schools equal to the best. Courses of studies were prescribed, a school superintendent was to be appointed in each diocese, local school boards of competent laymen were to be selected; in fact nothing was to be left undone to effect a thorough organization of the whole parish school system. The rapid growth, the educational strength, and the marked success of the parish schools date from this decided action of the Catholic hierarchy. As a result of this action of the Catholic bishops to-day there are over one million and a half children receiving their education in over five thousand Catholic free parish schools in the United States. This great educational work is carried on without

ROMAN CATHOLIC CHURCH

any financial aid from the state. The parish schools are maintained by the voluntary contributions of Catholics. For the Christian education of their children, Catholics are making tremendous sacrifices that elicit the praise of all thoughtful Americans; and at the same time they are saving to non-Catholic taxpayers a vast sum, estimated from \$30,000,000 to \$35,000,000 annually, for this is what it would cost the taxpayer if the children now being educated in the Catholic schools had to be provided for in the public schools.

The Catholic parish school system is now so thoroughly organized and equipped, its efficiency as tested by practical results so well established, that few hesitate to acknowledge that it is doing a great educational work. The Catholic parish school is not an experiment; it is an assured success, and it has come to stay. There was a time when it was thought by some that the parish school could not live beside the public school. The latter had the attractions of fine buildings, ample playgrounds, well-paid teachers, all that public money so generously provided by the state could provide, while the former had, up to within recent years, poor buildings, little if any playgrounds, and scant means for carrying on its work. The success of the parish school is largely due to the devotion and self-sacrifice of the thousands of religious women and men—the members of teaching orders of the church—who have consecrated their lives to Christian education. To these is due the present excellent condition of the free Catholic parish schools; without them it would be almost impossible for the system to succeed. To-day the network of parish schools extends into every state and territory and is under the guidance of the Catholic bishops and the local clergy.

From the beginning the Catholic church has had parish schools in the United States. It is interesting to note that six years before the establishment of a public school in New York there was a Catholic parish school, St. Peter's, Barclay Street, in that city. Earlier still, in the middle of the eighteenth century, there were Catholic schools in Pennsylvania. In 1781 in Philadelphia an old schoolhouse and lot were bought from the Quakers, and opened as a Catholic parish school in August, 1782. In the early days, however, these schools were few and rather poorly equipped. The buildings were not attractive and oftentimes unsuitable for school purposes. The schools were not well graded. There was a lack of teachers in those early days, for the numerous teaching communities of religious men and women were not yet widely established in this country. There was also in certain quarters a disposition on the part of some parents to ignore the directions of the church and to send their children to the public school. There was besides a strong popular feeling against

the parish school on the ground that it was "un-American." Notwithstanding these difficulties—the hampered means of the church and her people, the popular outcry against these schools, and the dissatisfaction here and there of some Catholics—the parish school system went on extending itself into every diocese and almost every parish in the country. To-day no Catholic parish is regarded as adequately equipped that has not a school and a course of study equal to the best. As a result of the insistence of the church to provide schools and perfect the system of teaching there has been in recent years a wonderful development of Catholic parish schools, academies, colleges, and universities.

In the New England dioceses, especially with the notable increase of the Catholic population in recent years, there has been a rapid growth in the number of parish schools; also in the dioceses of the Middle Atlantic States and in the newly formed dioceses of the West the development within a very short time has been very pronounced. Within the last thirty years in the dioceses of New England Catholic educational institutions have multiplied threefold. In the archdiocese of Boston the Catholic schools equal in number those which were flourishing in the entire province a quarter of a century ago, while the number of children in the parish schools, colleges, and academies of the archdiocese of Boston far surpasses the total attendance of the Catholic schools of all New England twenty-five years ago. In the archdiocese of Philadelphia the same marked growth of parish schools is to be observed. In 1869 there were forty-two (42) parish schools, with an enrollment of 15,232 pupils, while last year there were one hundred and forty-one schools, with an attendance of over 65,000 pupils. The same steady growth can be witnessed in almost every diocese throughout the country.

The Catholic population is increasing rapidly,—it numbers to-day over fifteen millions,—and it will tax the energies of the church to provide additional school accommodations proportionate to this increase. Free textbooks and the like in the public school accentuate the ever acute realization of the financial problem. Yet, in view of that which has been done, no one doubts that the loyal and self-sacrificing generosity of the people will be equal to the solution of these and other problems that will arise in continuing and completing the work of Catholic education. The single fact that the parish schools have over a million and a half pupils—almost one half of the Catholic children of elementary school age in the country—is splendid evidence of the solid growth of the educational system, as well as strong testimony to the spirit of zeal and self-sacrifice on the part of both clergy and laity that has made such a result possible. Here it may be observed that the

growth of the church's secondary schools has kept pace with that of the elementary schools.

School Buildings.—In the matter of buildings and school equipment the Catholic parish school is to-day generally up to all modern requirements. The school authorities fully recognize the necessity and importance of properly constructed buildings, and in their construction have paid due attention to all that is required to make them both healthful and attractive. The average Catholic rector fully understands that children are affected by their environment and that of necessity much of their time is to be spent in the schoolroom. Hence, he gives this subject much thought and attention and usually employs a competent architect. As a consequence we find almost everywhere, especially in the cities, substantial and oftentimes imposing parish school buildings, classrooms well-designed and so arranged as to give the best results as to seating, lighting, hygienic and sanitary arrangements, with the necessary halls, cloakrooms, etc. These buildings are usually of stone or brick, and compare favorably with the public buildings in the same place. The classrooms are provided with the latest style of desk and ample blackboard space. The ventilation, heating, and lighting are found to be, in most of the schools, all that could be desired. Many of the parish schools have also ample playgrounds. Nothing has thus been left undone in a material way to make the parish school-house an inviting place for the pupil. The cost incurred is oftentimes very great, running anywhere from ten thousand to one hundred and even as high as two hundred thousand dollars for a single building.

Administration.—The management of the parish school rests ultimately with the rector of the parish. He is usually aided by a local committee or school board made up of competent laymen who are interested in educational matters. The council of Baltimore suggested the appointment of such a body, and it has been found by experience that its services are most helpful. The members of the school committee visit the schools regularly, at least once a week, they inspect the building, are present at recitations, usually question the pupils, and in many other ways contribute to the efficiency of the school. The gentlemen who are selected for this position regard it as a special mark of honor and give their time and services cheerfully. They are a great aid to the pastor in his school work. They meet, usually once a month, in conference with the rector, when the daily workings of the school are discussed and suggestions made for remedying any defects or for bettering conditions.

Where the school attendance is large—over 300 or more pupils—there is generally a principal appointed from the teachers in charge

to supervise the daily work, to look after the discipline of the pupils, and to report to the rector the more serious violations of rule. It is the duty of the principal to see that the work in the various grades is properly done, to aid and direct younger teachers, and to supply the place of a teacher who may be temporarily absent because of illness or some other cause. The principal makes out the weekly and monthly reports which are sent to the rector and the parents of each pupil.

In most dioceses there is a diocesan superintendent who supervises all the schools of the diocese. He is a priest who is well up in educational matters and is set apart by the bishop for this work. He is relieved from the usual parish work and devotes his whole time to the supervision of all the schools in the diocese. He makes regular visits and holds examinations at stated times. He publishes annually a full and detailed report of the parish schools of the diocese, giving the standing of each school. No one can examine these annual reports without being convinced that the diocesan superintendent has been a powerful factor in the great progress made of recent years in these schools.

Teachers.—The teachers in the parish schools are for the most part members of the various teaching orders of men and women who have consecrated their lives to the work. Many lay teachers are found in the German, Polish, Italian, and Slavish schools, as well as in the parish schools conducted in small towns or rural districts where it is not possible to maintain a religious community. The parish school-teacher devotes his or her whole life to teaching. And thus the religious teacher has, in this respect, a decided advantage over those teachers who occupy themselves with the important duties of teaching until something more lucrative or attractive is found. The child's future is always the first and great consideration with these religious teachers. No one is admitted to undertake the responsibilities of a teacher who is not fully qualified for the work.

There are examining boards in every diocese to test the qualifications of teachers. The Church authorities strongly insist that teachers must thoroughly understand the art and science of education; that no teacher be employed who is not duly qualified. Teachers are required to secure certificates of proficiency either from diocesan school boards or from Normal or Regent examiners so that the public may know that none but competent teachers are employed in the schools. To fit such teachers, normal schools exist in most, if not all, the religious teaching communities. The Catholic idea of the ideal teacher is one in whom moral character, intellectual training, and professional skill cooperate in harmonious action for the success of the class and of the individual pupil; one who day by day becomes

the better teacher precisely because day by day he or she becomes a more diligent student, a more successful solver of the pedagogical or psychological problems that present themselves within the realm of the classroom. To secure such ideal teachers, or at least to make the combination of necessary qualities less rare, is the end aimed at in normal school training. The religious teaching communities justly claim to have been the first to establish normal schools for teachers, though from some of the histories of education, or from the data advanced by lecturers in schools of pedagogy, one would never be led to suspect the fact.

Teachers' institutes are generally held during the summer vacation and are conducted by men and women distinguished in their different branches of knowledge. They are specialists in the subjects with which they deal. The general nature of the work done in these institutes is along the lines of methods of teaching the common subjects usually taught in elementary schools. Not less than two and usually four or five instructors are sent to each institute. The work has been eminently successful, and has been approved by the bishops of the various dioceses in which it has been carried on. It has been found very beneficial to the school and helpful to the teachers.

Besides, there is held an annual educational conference of the leaders in elementary and secondary schools where the whole educational field is covered and discussed by Catholic men and women who have given their lives to the work of education.

The methods of the Catholic schools are not the methods of the public schools. The Jesuits, the great teaching order of the Church, have their methods bequeathed to them from the sixteenth century, when they captured the whole civilized world by the brilliancy of their teaching; the sisterhoods have their methods modeled after the constitution that Peter Fourier drafted for them in the last years of the same century; the Christian Brotherhoods have their methods as laid down by one of the most eminent educational geniuses of the seventeenth century, Saint John Baptist de la Salle (*q.v.*). The Catholic University at Washington has within the past year opened a summer school and institute of pedagogy with hundreds of teachers in attendance at its first session. The instruction treats of the history of education, the principles and methods of education, psychology, American and general history, and literary work. There are a number of Catholic educational periodicals and reviews, besides a growing list of books specially prepared to aid teachers in their work.

General Principles.—From what has been written the position of the Catholic church on this vital subject of education is plain. She holds firmly that religious and secular

ROMAN CATHOLICS

education cannot be divorced but must go together in order that the future citizen may be properly trained to discharge his duties to his fellow man and to God. In the studies pursued in her schools, while she aims to make her children good, conscientious Christians, she does not forget to instruct them in the history of the country, the origin and principles of its government, and the eminent men who have served it by their statesmanship and defended it by their valor, she instructs them in civic rights and duties and thus contributes to the making of enlightened, useful citizens, sincere and devoted patriots. The right of the church to establish and maintain her own system of schools, provided always that they be in conformity with the just and legitimate requirements of the State, has never been restricted by either state or national law. Liberty of education is an established fact in America. The true spirit of all American legislation has ever tended to protect the rights of minorities and to guarantee the absolute equality before the law of every citizen, no matter how he may differ from others in his religious or political belief. Here it may be said that Catholic citizens complain of the injustice that is being done them inasmuch as they are educating a million and a half of children in their parish schools and are taxed at the same time to support the public schools, from which they receive no benefit. But this very hardship has only served to place in a clearer light their self-sacrifice and practical loyalty to the principles on which Catholic education is based. It may be well also to note that it is not true that Catholics are opposed to the public school system as such. Their contention is that an education divorced from religious teaching is not complete or adequate. Therefore, as this essential is lacking in the school system supplied by the state, they feel bound in conscience to provide one of their own in which religion will find its proper place. Their hope is that in time their fellow citizens will, in justice, allow them out of the public taxes levied for educational purposes such proportion for results as their free schools show and as is the custom in Germany, Canada, England, and elsewhere.

ROMAN EDUCATION, ANCIENT — The education of the Romans is interesting principally as the direct link of connection between the civilization of ancient Greece and that of the modern western world. It was

ROMAN EDUCATION

profoundly affected, however, by the practical virtues and capacities of the Roman nation. Moreover, Rome as a small city state had one kind of education, Rome as mistress of the world another. The former was indigenous, the latter Hellenic; the former simple, traditional, domestic, and moral; the latter intellectual, literary, and philosophical.

Early Roman Education — The early period appears to have been as fully dominated by custom, by the idea of *mos majorum*, as is usual in communities of the smaller and more primitive type. The principal duty and necessity of a small organized society that is surrounded by powerful and hostile neighbors is to look to its own preservation, to maintain unchanged the qualities that have made its existence possible, and to train its sons in military as well as industrial efficiency. This then was the aim of the early Roman state. In practice, the arbiter of the education of children was identical with the arbiter of their lives and possessions, the father, whose authority (*patria potestas*) was absolute, even to the point of selling a family into slavery. It is not the less clear that the right of the old Roman law did not represent the customary attitude of a Roman father to his children; in fact, he left them in their earlier years to be brought up at the mother's knee. In the sturdy half military, half agricultural atmosphere of the old Roman family the boy was trained in obedience, seriousness, reverence, frugality, industry, and military courage. Father and mother were alike apt to be hard and severe. They were scrupulous in observing and teaching to their children the rites and ceremonies proper to each religious occasion; but they seldom appear to have manifested the Greek instinct for the ideal, the beautiful, or the imaginative side of life. Their offerings and rites were principally directed to the preservation of the household, the fruition of the crops, or the safety of the city. The father, or occasionally the mother, frequently taught the sons to read, write, and calculate money, and the more aspiring households made provision for the repetition of old heroic stories to the young, allowed the boys to be present at the reception of clients in the early morning and the festive banquets in the evening or even to attend the senate house in company with their fathers. Training in the use of arms must have been always obligatory on the Roman youth, and Plutarch remarks that Cato would not leave this or any part of his son's upbringing to a slave.

Throughout the early Roman period the power of the father is the primary feature of education, extending to exposure of the recently born infant or to slavery. But the conception of right among the Romans was correlative with that of duty, and it was the father's care to inculcate the standard moral virtues, *constantia* or firmness, *virtus* or forti-

tude, prudence, simplicity, *gravitas* or dignity, patriotism, punctiliousness in due observances and regard for law. There were certainly few schools prior to the period of direct Greek influence; there may not have been any. It is true, there are legends of Romulus and Remus going to school, and Virginia is represented as a school pupil, but it would be far-fetched to reason from the tales of the past that were current in Livy's sophisticated era to the actual conditions of a more primitive age. It appears probable, however, that from a very early period in the history of the republic there were schools near the forum, and that not only reading and writing but the laws of the Twelve Tables were a part of the recognized curriculum of these schools. An indication of deliberate moral training by means of legendary or historical examples is found by some in the large body of didactic biographical stories which survived from republican to imperial times.

It would also seem that a minimum of cultural and literary knowledge was expected of Roman boys prior to the period of Greek influence, since they were required to learn by heart the Laws of the Twelve Tables. These laws, adopted 451-450 B.C., were esteemed by Cicero to surpass the libraries of all the philosophers, both in weight of authority and wealth of utility (*De Oratore*, I 44). The extensive fragments of the Twelve Tables which have been collected by the industry of modern scholars reveal the litigious character of the Romans, their practical genius, their scrupulous piety, and one may add their lack of idealism. The laws prescribed the mode of procedure in connection with a summons before the magistrate, judicial proceedings, execution for debt, the rights of the father, inheritance and tutelage, dominion and possession, real property, torts, public law, sacred law, and certain supplementary matters.

Græco-Roman Education.—This is the name which might well be applied to the system of instruction that one finds in Rome in the later days of the Republic and under the Empire. Even by the middle of the third century B.C., the tide of Greek influence was so strong that Roman diplomatists could speak Greek, and books written in Greek at Rome could find readers. Greeks who had been brought to Rome as slaves were transformed by the merit of intellect and culture into teachers. In 146 B.C. Greece became a Roman province, and this date may be regarded as marking, as well as any other, the moment of the conclusive triumph of Hellenic culture over Roman militarism. But at the beginning of the second century the Greek puns and jests of Plautus were already intelligible to a Roman audience, and Greek slaves were already employed as *litteratores* or teachers of reading and writing. The principal school

text employed by the early Græco-Roman teachers was a Latin translation of the *Odyssey* made about 250 B.C. by an emancipated slave, Livius Andronicus, the father of Roman Hellenism. Latin translations and imitations of Greek plays were also used in the schools, while the study of the Laws of the Twelve Tables was retained at least until the age of Cicero. The more ambitious teachers who ventured into the field of literature, including Greek as well as Latin in their curriculum, were distinguished from the *litteratores* by the title *grammatici*, and may be regarded as secondary rather than primary teachers. Indeed, by the fourth century A.D. a *grammaticus* was a professor of university rank. The title appears to have been first claimed by the Greek Proxiphanes of Rhodes about 300 B.C.

Plutarch remarks that the earliest Roman teacher to open a regular school with prescribed fees was Spurius Carvilius, who flourished about 230 B.C. It is probable that education, where it had not been the task of a household slave, had previously been compensated by free-will offerings. The first serious teaching of grammar in Rome is attributed by Suetonius to Crates of Mallos (q.v.).

The most advanced type of education, however, to which one finds repeated reference in Roman literature was conducted either in the schools of the philosophers or in those of the *rhetores*. Considerable opposition was manifested against philosophy. One hears of the banishment of two Epicurean philosophers from Rome about the middle of the second century B.C., and of the Latin philosophers and rhetors in 161 B.C. The schools of the philosophers were probably of the informal and private character which they had traditionally assumed among the Greeks; but those of the rhetors appear to have adopted regular textbooks and to have gradually standardized an elaborate curriculum. Public speaking was one of the main roads to preferment in Rome, and Cato included a book on the art of speaking among the texts to be studied by his son. Cicero's book *De Oratore*, and afterwards Quintilian's *Institutes*, furnished materials for discussion and study by the most advanced pupils. It is true that rhetorical instruction at Rome was formal in character, it is true that its principles were not lofty, nor its rules inspiring; but it equipped men like Cicero and Cæsar for their labors and successes. It was not an education intended for the majority of Roman citizens, but for those only who aspired to public honors. A few of the chairs of rhetoric in Rome were endowed by the emperors, Quintilian's being the first, and certain professorships at Athens appear to have been similarly favored. But the life of a teacher is repeatedly declared to have been laborious and ill remunerated; and although the offices of *grammaticus* and *rhetor* came to be regarded with some honor, the

lower grades of the profession were never highly esteemed. There was, however, a steady tendency for the *literator* to aspire to the work of a *grammaticus* and the *grammaticus* to that of the *rhetor*.

In the field of physical education the theories of the Romans were radically opposed to those of the Greeks. The chief end of the Roman exercises was war, although riding, swimming, hunting, and even quoit-playing, shared the popularity of the pursuit of dexterity in arms. The emphasis on beauty and grace, so characteristic of Hellenic life, was unacceptable to the Roman *gravitas*, and even antithetical to the Roman conception of virtue. "She played and danced more gracefully than is necessary for a virtuous woman," says Sallust of Sulpicia. The Greek practice of the naked wrestling of youths in the palaestra, the Hellenic fondness for the flute and the lyre, the performances of citizens upon the stage, and the practice of public dancing were as earnestly condemned by the conservative Romans as they were ardently championed by the admirers of Hellas. The first palaestra in Rome appears to have been that which is recorded to have been built by Nero. The traditional Roman *gravitas* associated every form of entertainment with the duty of a slave or the surroundings of vice.

Oratory, more than any other study, occupied the attention of the talented Roman youth. In politics, jurisprudence, or war, oratorical skill was equally indispensable. A manual of oratory is ascribed to the elder Cato. In the words of Livy, some were carried forward to the highest offices by jurisprudence, others by eloquence, others by military glory. Oratory then was recognized in the Republic and earlier Empire as a highroad to advancement and fame. Cicero regretted that whereas for the Greeks it had been an end in itself, for the Romans it was but a means to success at the bar. The youths trained in oratorical schools would begin to speak in the forum at eighteen or nineteen years of age, at times making their debut in a funeral oration. From the time of the elder Cato it became customary for speakers to write down and publish their orations which had previously been delivered without notes. The speeches of Cicero, Quintilian, and others were taken down by clerks, probably in shorthand, and published with or without the consent of the author, sometimes in garbled versions. Under these conditions the study of rhetoric in Rome was anything but the perfunctory occupation that it seems to be at the present time. It was a practical and profitable thing, frowned upon by the old-fashioned censors (who decreed the expulsion of the rhetors from Rome in 92 B.C.), but welcomed by the ambitious youth. One reads that only four years after the decree above cited, a freedman of Pompey, one Vultacilius Plotus, skilled in Latin rhetoric, had

opened a school in the city. There were also numerous teachers of Greek and Asiatic oratory in Rome during and subsequent to the age of Cicero.

Under the Empire oratory became less genuine and more servile. Forced to renounce serious topics, the schools became the center of a host of fictions. The ancients had been orators, the moderns were but rhetoricians; at least, such was the judgment of Tacitus. The Empire was never so sure of maintaining a check upon freedom of speech as after it had begun to pay the salaries of eminent professors of rhetoric, the first being Quintilian himself in the reign of Vespasian. Gaul and Africa in the third century became important centers of rhetorical study, Gaul being signalized by the skill of her professors in the manipulation of forms of style; Africa by the energy of her rhetors, including Tertullian, Anobius, Cyprian and Augustine, in the defense of Christianity.

When a pupil had completed his task under the *grammaticus*, he went naturally to the school of the *rhetor*, where his work began with demonstrations, and proceeded to declamations, deliberations, and controversies. Controversies included case law, the subdivision of the subject, and the appeal to mitigating circumstances. But the cases cited in the schools were strangely unreal. Pliny, Petronius, Tacitus, and others ridicule the questions that were customarily raised and disputed, dealing with tyrants, or pirates, or the sacrifice of maidens. Contemporary politics were practically tabooed. It was the opinion of Petronius that such instruction made youths into fools. Little realism was attached even to historical debates about Sulla and Hannibal; none at all to declamations on subjects taken from Vergil, Ovid, or Homer. But the same stereotyped empty fictions continued to be treated in the time of Ausonius, the same in the days of Augustine, the same even as late as the sixth century. The subjects appointed for prose composition were no more vital than topics of debate. In particular, among the favorite exercises of the schools was the composition of fictitious letters, for example, an advanced pupil would be called upon to write a letter from Cicero to Cæsar, or from Seneca to the Apostle Paul.

Other subjects of study in the Roman schools require no more than a cursory reference. Arithmetic was taught in the schools, as is indicated by Horace, but we know little of what was done in the subject in his day, although there are some indications that the decimal system of notation may have been taught much earlier than has been supposed. No advance was made upon the knowledge formerly possessed by the Greeks in arithmetic and geometry, which suffered in the estimation of scholars by their supposed alliance with astrology. The Romans were by no

means the equals of the Alexandrian Greeks in mathematical attainments. Neither did they study natural history at first hand, but only from Greek texts, which were gradually corrupted and confused by the introduction of superstitious auguries and credulous allegories and fables.

The study of agriculture flourished among the Romans, but in a private and individual way, and by means of books rather than schools. Medicine was a purely Greek art, although under the later Empire the Arabic physicians had already begun to dispute the palm with the Greeks; this art also depended upon books and individual instruction, but not schools. The same general status is characteristic of architecture and military science. Geography, music, and astronomy were actually taught in school, but only in the first of these subjects did the Romans show any originality or tendency to add to the sum of human knowledge. The measurement of land, however, was so important from a legal and military point of view that special schools of surveying were established under the Empire, the first impulse having been given by Cæsar, who summoned Greek teachers in this field from Alexandria to Rome.

Organization. — Roman schools were private undertakings; and it is probable that at all times the children of the more opulent classes received their elementary instruction, not at school, but through a tutor at home. Livy refers to the existence of schools in the bookshops (presumably near the bookshops) in the Forum at the time that the ministers of Appius Claudius offered violence to Virginia, who was a daughter of the people. Horace refers with contempt to the hedge-schools of his day, which were such that his father had refused to send him to the school at Venusium, but had brought him for better instruction to Rome. Quintilian indeed discusses the question whether instruction is better given at home or at school, and decides in favor of the latter, but his reference throughout is to secondary rather than elementary studies. Frequently one *paterfamilias* would employ a Grecian grammarian and admit the children of neighbors to his instruction, as did Cato, who is reported to have also personally superintended the education of his son. Quintilian says that Greek was commonly taught before Latin. Each boy was accompanied to and from school by a slave or *pedagogus*, each girl by a nurse, and pedagogues and nurses remained during the period of instruction. Thus Augustus set aside reserved seats for boys of noble birth in the theater, and next to them seats for the pedagogues.

Elementary Schools. — These were conducted by masters known as *ludimagistri*, *litteratores*, or sometimes in the later period *grammatistæ*. If not at home, it was at these schools that children learned to read and write. It seems that children went to

these schools at as early an age as seven, and Horace and Quintilian refer to the devices of kind teachers to make the primary lessons amusing and interesting. Reading was learned by a syllable method. Writing was practiced on wax tablets; and at first the teacher guided the beginner's hand. Arithmetic appears to have been emphasized more than in Greece, especially counting, which was practiced both with the fingers and the abacus (*q v*). In most of the elementary schools there was but one teacher, who was, however, frequently assisted by a subordinate or even a pupil teacher. Apparently the teachers of elementary schools were socially despised, indeed so many slaves and freedmen were employed as teachers that this could not have been otherwise. Punishment was frequent and severe, and was generally inflicted with a ferule, though there are references also to the use of whips furnished with leather thongs. The Stoics in particular defended corporal punishment, a fact which would be significant even if one had not the evidence of Menander that "the man who has not been flogged is not trained." It does not seem certain whether the ordinary schools were attended by girls as well as boys, but there are indications that this may have been the case. As to the school building, it was generally a sort of porch with a roof, but no sides, though curtains appear to have been used on occasion. The pupils sat on wooden benches, the teacher on a *cathedra*, or raised chair; desks appear to have been omitted from the furniture. On the other hand, the walls were frequently hung with pictures and tablets, and perhaps ornamented with maps and busts of celebrities. Horace mentions eight *asses* — about eight cents — as the monthly fee of the elementary school at Venusium. Holidays extended to from three to seven days at the *Saturnalia*, and five days on the *Quinquatris* in March; and it seems probable that a summer vacation of four months was allowed in the elementary (but probably not in the higher) schools, extending from the Ides of June to the Ides of October. On the *Nundina*, the market days, which came every eighth day, there was apparently a regular whole or partial holiday, and Rome was greatly given to extraordinary festivals of a religious or public character, such as must surely have been observed in the schools. The schools opened, however, at daybreak, sometimes even earlier. In the days of Ausonius the customary length of a school day was six hours.

Grammar Schools. — Education of a secondary character was given in private institutions in which a master instructed boys who had already learned the elements at home or under the *literator*. The literary character which instruction had assumed among the Greeks continued to predominate in the imperial era. Greek was frequently taught before Latin;

ROMAN EDUCATION

and the principal textbooks were the works of Greek poets, especially Homer. The elements of rhetoric were frequently taught in the schools of the *grammatici*, but there was a growing disposition to reserve this study for a still more advanced type of school, that of the rhetor. But Roman masterpieces, and especially the works of Cicero, were studied, and Æsop's *Fables* were regularly employed as mental exercises. Rules of grammar, extracts from literature, the Twelve Tables and doubtless other standard formulae of knowledge were learned by heart. It was a customary thing for the grammarians to teach the calendar and other necessary tables through ingeniously constructed rhymes. (See GRAMMAR SCHOOLS.)

Rhetorical and Philosophical Schools.—These two types of schools were sometimes connected so as to form loosely organized universities, as at Rome and Bordeaux. The students at these schools were frequently but not always of an age to wear the *toga virilis*. The students of rhetoric practiced first narrative, both in fable and history, then criticism, and finally the construction and delivery of panegyrics and philippics. Argumentative topics, some practical, many absurd or at least irrelevant to practice, were also discussed, and imaginary legal disputations furnished another favorite exercise. The pupils were frequently taught in classes, but these classes were usually conducted by the same master, one class studying while another recited. After graduating from a Roman rhetorical school, ambitious students frequently went abroad to study at Greek universities, especially those of Athens and Alexandria. The change of toga, which introduced a Roman youth to a freer and less constrained mode of life, usually occurred at fifteen years or shortly afterward, but this act was wholly in the control of the father. Full citizenship appears to have been assumed at about the age of twenty, after a year of probation in which the young man was expected to discharge certain prescribed exercises in the Campus Martius and otherwise to make ready for the assumption of the full responsibilities of adult Roman life.

Many of the later emperors manifested a profound interest in higher education. Augustus, when he expelled foreigners from Rome, exempted the teachers of the liberal arts. Vespasian actually endowed the chairs of Greek and Latin rhetoric with an annual payment of 100,000 sesterces, but this endowment must have been restricted to a few. Quintilian is the first professor known to have received an endowment. Hadrian, Antoninus Pius, and Severus appear to have been distinctly liberal towards the cause of learning. A kind of scholarship is mentioned by which the children of the poor were granted a gratuitous supply of corn and a free education.

ROME

Five thousand children are said by Pliny to have been thus supported by Trajan. Constantine granted a number of exemptions and privileges to public teachers, Julian prohibited Christians from teaching and exercised a censorship over appointees; and Gratian fixed the salaries of professors, providing that a public teacher of rhetoric should receive twice the salary of a teacher of grammar, while at Tivoli, the temporary capital, salaries were to be highest. The late Roman period appears to have been marked indeed by considerable devotion to study, even to the extent of critical research; but education at the same time appears to have been lacking in any principle of progress or originality.

ROME, UNIVERSITY OF, ITALY.—The *studium urbis*, or university of the city, as distinguished from the *studium sacri palatii*, was established in 1303 by Pope Boniface VIII as a *studium generale*, with an emphasis on arts and law. In 1318 the right of the University was limited to granting degrees in canon and civil law. The institution continued during the schism, but decayed rapidly, probably in large measure because of the absence of democratic control prevalent at other Italian universities. It was reorganized, however, under Pope Eugenius IV, who is regarded as the second founder, in 1431. The Roman municipality also made grants of money. But in spite of the efforts of a number of succeeding popes, the progress was very slow. Leo X. laid the foundations for new buildings, completed under Sixtus V., extended the *Sapienza*,

ROOF PLAYGROUNDS

a building erected under Alexander VI, and united the *studium ubi* with the *studium sacri palatii*. The latter was a university attached to the Papal Court for the study of law. It was founded in 1244-1245 and was attended largely by priests and beneficed clergy. Theology, philosophy, and medicine were added later. In 1311-1312, under the direction of the Council of Vienne, professorships in Greek, Arabic, Chaldean, and Hebrew were established to train missionaries for the Orient. A peculiarity of this university was the fact that it was migratory and moved with the Papal Court. The disturbed condition of Rome during the sixteenth century retarded further progress. And, indeed, the institution never passed beyond very modest limits until the nationalization of Italy. After 1870, the government devoted its attentions to the questions of higher education. The faculties of the University are as follows: law; medicine and surgery; physical, mathematical, and natural sciences; philosophy and letters. The following schools and courses are also maintained: engineering, pharmacy, archaeology, medieval and modern art, oriental studies, agriculture; and education. The enrollment in 1910-1911 was 3816 matriculated students and sixty-six auditors.

ROSCOLLINUS (c. 1050-1122). — An eleventh century scholastic philosopher. He was born in lower Brittany about the year 1050. After studying at Soissons and at Rheims he became Canon of the Church of Compiègne and taught successively at Compiègne, Besançon, and Tours. In 1094 he was condemned by a Council held at Soissons, the charge being his heretical doctrine in regard to the Trinity. After a brief sojourn in England he returned to France, resumed his teaching, and had many distinguished men, including Abelard, among his pupils. He died about the year 1122. Roscollinus was a Nominalist. He maintained that the universal is neither a concept nor a reality, but only a name. The phrase, however, that the universal is merely "the breath of the voice" (*flatus vocis*) is very probably the expression of an opponent, not Roscollinus' own. He was also suspected of sensism, or the doctrine that the mind has no power superior to the senses. In his advocacy

ROSENKRANZ

of dialectic he incurred the distrust of the mystics, who accused him of rationalism.

ROSENKRANZ, JOHANN KARL FRIEDRICH (1805-1879) — A German philosopher, born at Magdeburg. He studied at the universities of Berlin, Heidelberg, and Halle, and began his long career as a university teacher in 1831. Two years later he was called to the University of Königsberg to occupy the chair of philosophy, which had been made famous by Kant and Hebart. He filled this post until his death. The incumbency of these three philosophers in this professorship extended over a century. For a time Rosenkranz was influenced by Schleiermacher, but later became one of the most important disciples of Hegel (*q.v.*). Although at one time he sought to make some modification of the master's system, he did not swerve to either "wing," but formed a part of the "center." His unusual activity as teacher and author was directed to an application of the Hegelian method and principles to education, history, literature, theology, and philosophy. Among his writings may be mentioned *History of German Poetry in the Middle Ages* (1830), *Psychology* (1837), *History of the Kantian Philosophy* (1842), *Studies* (1830-1848), *Life of Hegel* (1844), *Aesthetics of the Ugly* (1853), *Science of the Logical Idea* (1858-1859), and *Hegel as Germany's National Philosopher* (1870, translated into English by G. Stanley Hall).

The masterpiece in the literature of the philosophy of education is Rosenkranz's *Die Pädagogik als System* (1848). A translation of it by Anna C Brackett appeared under the title, *Pedagogics as a System*, reprinted from the *Journal of Speculative Philosophy* (1872-1874). It appeared in a revised form in 1886 as *The Philosophy of Education*, being the first volume of the International Education Series (New York), edited by William T. Harris (*q.v.*). In his application of the philosophy of Hegel to the problems of education, Rosenkranz so formulated his grasp upon the theoretical, practical, and historical material as to have practically determined the course of serious reflection in this field since his time.

What is the final meaning of education? Can this meaning explain the educational practices of the present as well as of the past? Taking a philosophical view of psychology and the history of civilization, Rosenkranz

finds constructive answers to these questions by placing education in its universal relations. It is considered in its general idea, in its special elements, and in its particular systems. Man's real nature consists in his relation to his ideal, and education is the process of developing this true nature both in individuals and in nations. Our animal nature must be suppressed, an accomplishment of the process of self-castrangement (*Selbst-Entfremdung*). This is a dialectical process of looking beyond the usual to the strange and foreign things in life, only later to find one's self in a higher stage of self-appreciation. Education is possible only to self-active beings, such as human minds are. The form and limits of the process are consequent upon its nature. In its special elements, education includes physical, intellectual, and volitional training. The explanation of work, play, habit, and the stages of the formation of the higher faculties out of the lower, are elaborated similarly. The social elements in the process are clearly recognized by the enumeration of the fivefold system of institutions which contribute to the process: family, school, citizenship, vocation, and church. "Education is the preparation for life in institutions." The number of pedagogical principles is limited to a few ideas, and therefore there cannot arise many particular systems of national education. The third part of the *System*, by presenting a synthetic and appreciative survey of national types of schools and educational aims, has contributed permanently to the study of this historic material. The broad development of education has been through the forms of national, theocratic, and humanitarian types. The highest form is the education of the state, which "must furnish a preparation for the unfettered activity of self-conscious humanity." E. F. B.

ROSMINI-SERBATI, ANTONIO (1707-1855). — One of the most important persons in modern Italian philosophy, was born at Rovereto and died at Stresa, Italy. He belonged to an old noble family, and inherited its fortune at the age of twenty-three. Before reaching his majority he had determined to devote himself to philosophy and to the service of the priesthood of the Roman Catholic Church. He founded, and contributed largely to, a new religious order, the Institute of Charity (sometimes known as Rosminians), comprising the Brothers of Charity, which received Papal sanction in 1830, and the Daughters of Charity, or Sisters of Providence. Through its branches, which spread into Italy, Switzerland, France, Great Britain, and America, the order added to its work of charity the maintenance of elementary schools, Sunday

schools, and asylums, including provision for the training of teachers. He lived, at various times, in devoted service to the Church and to humanity, at Rovereto, Milan, Rome, Domodossola, Trent, and Stresa, patiently enduring much opposition and persecution. Early discovering his philosophical interest, he labored to perfect this into a complete system. The idea of being is objective, fundamental, and enters into all acquired knowledge. Being and truth are convertible terms. This comes to us as an intuition and not as a judgment, and is therefore free from all error. Perception gives us true external existence and reflection yields full specific ideas. Mind develops further by advancing to abstract ideas or principles of science. On such psychological grounds, he attempted a system of philosophy that should be a final cyclopedia of knowledge. By giving new form and new vigor to conceptions already known, he extended the influence of philosophy in southern Europe through his zeal to unite rationalism and the faith of revelation. He wrote *New Essays on the Origin of Ideas* (1828-1830), *Principles of Moral Science* (1831), *The Five Wounds of the Church* (1832, published 1848).

During the last years of his life Rosmini exerted great influence on educational thought and practice, especially in Italy. In 1839 he began his chief educational work, *The Rising Principle of Method Applied to Education*. This treatise was planned to include three volumes, but the fragment published posthumously (1857) includes only six sections. He consciously used his philosophy as a basis for education. Psychology and anthropology present the manner of action of human faculties, ideology and ethics state the objects which are to stimulate the mind in order to educate it aright, while ontology and theology exhibit the ends which human development is to realize in rest and satisfaction as the goal of all life. Education must find "the invariable law of the progress (of the human mind) and the natural scale of thought by which it ascends. The law must hold good for all intellects alike, because it is intrinsic to the human mind. The scale must be the same for all minds, great or small, without a single step being omitted by any, although some minds will go faster and some slower." The "law" becomes a proper gradation of objects. "A thought is what serves as matter or supplies the matter for another thought" (Davidson). The practice of education, or method, must therefore be guided by the development of knowledge through the successive periods of life, which are functionally characterized by the degrees of cognition attained. In analyzing this development, Rosmini recognizes five periods up to the seventh year of childhood, and traces the natural continuity in the four "orders of cognition" appearing up to this time. They include simple perceptions, ab-

stract mental images, judgment and comparison, instructive and appreciative volitions, and the beginnings of the moral sense. In this effort he worked with Herbart and Froebel, but independently, in laying the basis of modern education, and anticipates, in form, at least, modern genetic psychology. His views exerted considerable influence upon Thomas Davidson (*q.v.*). He also wrote *Unity of Education, Liberty of Teaching, and a Catechism arranged in accordance with the Ideological Order*

ROSTOCK, GRAND DUCAL MECKLENBURG-SCHWERIN UNIVERSITY OF

— A university in Germany, which, although to-day the smallest in point of attendance, is one of the very oldest. It was founded in 1419, the Papal Bull of Martin V being dated February 13, and the formal opening taking place on November 12. Heidelberg and Leipzig (*q.v.*) are the only existing German universities that take precedence over Rostock in the matter of age. Most of the members of the first faculty hailed from the University of Erfurt (*q.v.*), which had been established in 1392, and which served as a model for the new institution. The University of Rostock was organized as a school of three faculties, the theological faculty not being added until 1432. It soon attained considerable renown and played a prominent rôle in the field of higher learning in north German territory. Before the close of the century, the University was forced, owing to religious and local feuds, to move its location twice, once to Greifswald, and once to Lubeck, and the Reformation brought even more disastrous results in its train, so that by 1527 there were only ten students in attendance. Although the Reformation had secured a firm foothold in Mecklenburg, several members of the faculty clung tenaciously to the old belief, the first outspoken Protestant rector not being installed until 1538. But after the death of the last Catholic rector (Boyo), in 1542, the adherents of Luther secured permanent control. A thorough reorganization of the institution was now undertaken, culminating in the new regulations of 1563, which continued in force for almost two hundred years. In accordance with these, the duke and the city each appointed and paid nine professors, the rector being

chosen from one group the first semester and from the other group the second. The first rector under this new arrangement was David Chytrius, the leading Lutheran theologian from the second half of the sixteenth century. Various Hanse towns came to the financial aid of the institution at this time, and in 1565 the new main building was erected, the famous "Weiszes Kolleg," which did service for three centuries, being replaced in 1860 by the present structure. As a result of the new order, the institution flourished for almost a century and entered at this time upon the period of its greatest renown, the two hundredth anniversary of its foundation being celebrated in 1619 with much splendor. The institution did not suffer as much during the Thirty Years' War as it had during the Reformation; it was only during the occupation of the city by Wallenstein (1628-1631) that a serious influence upon the attendance was noticeable. Shortly before the war (1614) a public university library had been established. During the latter half of the eighteenth century difficulties arose over the desire of Duke Frederick the Pious to appoint Döderlein, an adherent of pietistic doctrines, to a chair in the theological faculty, and a conflict between the duke and the city magistrates led to the establishment by the former of a new university, that of Bützow, in 1760, the dual half of the faculty of the University of Rostock being transferred to the new institution. This was a hard blow for Rostock, but it was soon recognized that the small country could not support two institutions of higher learning, and in consequence the University of Bützow was closed in 1789 and merged with the older institution. In 1827 the city relinquished its rights in the administration of the University, which was attended at that time primarily by residents of the duchy. With the election of the new main building (1869) and of a series of institutes in the years after the Franco-German War, a new impetus was given to the University which was reflected in the student enrollment, the number of students having increased from 164 in 1875 to 1008 during the summer semester of 1911. Of the latter, 920 were matriculated students, of whom 386 were enrolled in philosophy, 384 in medicine (including dentistry and pharmacy), 103 in law, and 47 in theology. The faculty consists of about 75 members, of whom 20 are docents. The annual budget amounts to approximately \$275,000. The Grand Duke of Mecklenburg-Schwerin serves as chancellor, the rector being elected annually by the faculty. The library contains 285,000 volumes.

ROSWITHA (HROSWITHA).—Nun of Gandersheim who lived in the second half of the tenth century. She is noteworthy for her scholarship and knowledge of many of the liberal arts. She wrote a number of poems on religious subjects, legends of the saints, and a panegyric on the Ottos. Her best-known works are seven dramas in prose. These were written in imitation and to take the place of Terence, whose works were regarded as immoral. Roswitha's dramas are short and deal generally with the triumph of virtue over vice, of Christianity over temptations. Much interest was shown in her works during the humanistic revival, when they were edited by Conrad Celtes.

ROTHSTEIN, HUGO (1810-1895).—German military officer and authority on gymnastics. A man of wide interests and culture, he was attracted during a visit to Sweden in 1843 by the Ling system of gymnastics. An article on the subject came to the notice of King Frederick William IV, who sent him with Lieutenant Teckow to Stockholm for a course in gymnastics. In 1846 Rothstein issued the first part of *Das Gymnastik nach dem System des schwedischen Gymnastarschen, P. H. Ling*, which was completed in 1850. *Das Gymnastik* consists of five parts: (1) Introduction giving an account of Ling, and a discussion of the scope of gymnastics; (2) Educational Gymnastics; (3) Corrective Gymnastics; (4) Offensive Gymnastics (fencing, boxing, etc.); (5) Aesthetic Gymnastics. In the second part Rothstein discusses the educational value of gymnastics, the "art of understanding the importance of physical movements for the all-round, harmonious development of man." The teacher of gymnastics should, accordingly, be familiar with

ROUMANIA

anatomy, physiology, dietetics, etc., and should understand the relation of the physical to the psychical, for the end of gymnastics is to make the body the servant and instrument of the soul. Rothstein was opposed to gymnastic apparatus and for a time secured much support for his views. He objected particularly to the parallel bars (*Barren*), and as director of the *Zentral Turnanstalt* (1857-1893) removed them in 1860 from the gymnasium. Considerable opposition was aroused throughout Prussia and the question (*Barrenstreit*) was taken to the House of Deputies which at first was inclined to support Rothstein. The chief opponent of Rothstein was Du Bois-Reymond and the two continued the controversy even after the former's retirement from activity in 1893, owing to the success of the opposition.

Rothstein also wrote *Bemerkungen über die Gymnastik für das weibliche Geschlecht nebst Anweisungen zum Betrieb desselben* (*Notes on Gymnastics for the female Sex with Remarks on its Conduct*, 1860), in which he advocated in particular free exercise and the total elimination of apparatus for women.

See GYMNASICS.

ROUMANIA, EDUCATION IN.—Roumania is a constitutional monarchy with an area of 50,720 square miles and a population (1909) of 6,865,739. It comprises the former principalities of Wallachia and Moldavia, their union under the present name having been proclaimed Dec. 23, 1861. After the union, Roumania remained subject to Turkey until May 21, 1877, when the representatives of the people, assembled at Bucharest, declared its independence, confirmed by the Congress of Berlin, July 13, 1878. Of the entire population 98 per cent belong to the Orthodox Greek Church which formerly exercised entire control over education. In 1869, two years before the union of the two provinces was proclaimed, the civil government assumed this responsibility. In 1864 a law was passed making primary instruction free in state schools and obligatory for all children, parents being allowed the choice of agencies. More than a decade passed and education became again the subject of discussion and proposed reforms. These were finally embodied, as regards primary education in a law of 1893, and, as regards other departments of education, in a law of 1898.

Administration.—The general control of education is vested in the Minister of Public Instruction, but other ministers have charge of schools pertaining to their special provinces. The Ministry of Public Instruction is organized in three departments: (1) primary instruction, including primary normal schools; (2) com-

ROUMANIA

mercial, technical, and private schools, (3) secondary and higher education.

The general council, advisory to the Minister, is organized in sections corresponding to the departments named above, and composed of members nominated by their colleagues, but appointed by royal decree for a term of five years. There is also a permanent council of three members chosen by the Minister from the body of university and secondary professors for a term of three years. This council considers only matters pertaining to secondary and higher education. When programs are revised, the director of higher education and the general inspectors must be called to assist the council. There is also a consultative committee which advises the Minister in regard to all matters of public art which come within his province. The business affairs of the system are in charge of special boards constituted as follows: for the service of primary education, the staff of general inspectors and district inspectors; for vocational or technical education, the directors of the respective schools, for secondary education, the general inspectors and directors of schools. The institutions of higher education have charge of their own finances.

There are twenty-three general inspectors under the immediate direction of the Minister, besides special inspectors appointed for music, gymnastics, and drawing, and thirty-three subordinate inspectors or revisors.

Primary Education. — The general direction of primary education rests with the central authorities; but the law imposes upon communal authorities (mayors and councils) the obligation to establish primary schools to the number required. Private primary schools are recognized by law, but are not the subject of special regulation. The ordinary primary schools are for children of the obligatory school age (6-12); attendance upon elementary courses is obligatory up to fourteen years of age. Communes are also authorized to establish higher primary schools where there is a demand for them. Distinction is made between city and rural schools, the course of study for the former covering four years of ten months each, and for the latter five years of nine months each. Agriculture is an obligatory subject for country schools, and each one must be provided with a school garden. The gardens are cultivated by the master and pupils, the product being divided between them, the former receiving 75 per cent and the pupils 25 per cent. In the city schools manual training takes the place of agriculture in the rural schools.

Political conditions have thus far precluded the universal provision of schools; but there is steady progress in both the number of schools and the number of children in attendance upon them, as indicated by the following statistics: —

VOL. V — P

ROUMANIA

	NUMBER OF SCHOOLS			NUMBER OF PUPILS		
	1904	1907-1908	1907-1908	1904	1907-1908	1907-1908
Rural	1088	3876	4176	23,200	200,083	520,880
Urban	105	302	398	23,200	200,083	520,880
Total	2153	3007	4563	23,200	200,083	520,880
Per cent of Increase		84	15		118	77

Later, though incomplete, statistics show a continuance of progress. For 1909-1910 there were reported 4896 rural schools with 504,297 pupils and 6460 teachers; and 379 urban schools with 80,656 pupils and 7784 teachers. The entire attendance had increased by 10 per cent over that for 1907-1908 and was equivalent to 62.3 per cent of the population of school age, or 8.5 per cent of the entire population.

The increase in the number of schools is due to the policy adopted in 1898 of creating a special fund (*caisse des écoles*) to aid the communes in providing school buildings. The local authorities, mayors, and prefects, are authorized to arrange for loans from these funds to be repaid in installments on easy terms. The control of schoolbooks, their publication and selection, are committed to the Minister of Public Instruction in order to lessen the cost to parents. This is an important item as the complete course of instruction for elementary and higher primary schools is expensive. Besides the elementary branches, the program includes geometry, history of Roumania, geography, natural and physical sciences, hygiene, moral and religious instruction, notions of civil law, drawing, and vocal music, and for rural schools, agriculture. The great importance attached to agriculture is indicated by the provision of farms in connection with country schools which are cultivated by the masters assisted by the older pupils.

Benevolent Institutions. — Roumania is distinguished for the special care given to poor and needy children. Clothing and books are provided for the destitute in order that they may attend school; scholarship funds are maintained in the interests of needy, but promising, pupils; and vacation colonies are provided which afford sickly children opportunity for outdoor life and recreation. The public appropriation for these benevolent works, together with the care of orphans, amounts to 515,000 lei (\$103,000) annually. For the public institution for deaf-mutes, accommodating 190 pupils, the appropriation in 1910 was 131,000 lei (\$26,000).

Teachers. — The distinction between urban and rural schools is maintained in the classification of teachers. Although the regulations require that teachers shall be specially trained, untrained candidates, who are properly

recommended, may be appointed as assistant teachers in small rural schools. These assistants, who are often clerical novitiates, work under the direction of the nearest master or regular teacher, who thus becomes a sort of district supervisor. To be recognized as a full teacher the candidate must be a graduate, and further must have completed two terms of service of three years each, which are terminated by professional examinations. The full appointment carries a life tenure, excepting in case of misconduct. The accused teacher may appeal his cause to the superior council.

Salaries are regulated by grade and length of service. Provisional teachers in rural schools begin with a salary equivalent to \$13 a month and receive increases at the rate of 10 per cent at definite periods. Masters of rural schools start at \$18 a month and have four increases at the rate of 15 per cent on the current salary. Teachers in cities of less than 30,000 inhabitants receive \$38 a month, and in cities of larger populations, \$43. Directors of schools are provided with free residence or money equivalent, and all teachers are entitled to extra pay for instruction in special branches, and for services in the classes for adults. The latter are provided for by the education law. Infant schools are encouraged by the government, and a minimum salary is assured to the directors of schools of this order.

Normal Schools.—There are nine normal schools, two for women and seven for men; of the latter, one is maintained by a private society, authorized by the government, the others are all state schools. Candidates are admitted from the age of thirteen to seventeen upon the results of a competitive examination. The course of study covers six years, of which the last is given exclusively to educational theory and practice. The pupils come mainly from the peasant class.

The budget for 1910 carried for primary education a sum equivalent to \$2,880,719; of this amount \$2,068,149 was for salaries and \$569,772 for increases, or altogether 91 per cent for the teaching service.

Technical Education.—A system of technical education under the charge of the Minister of Public Instruction was provided for by a law of 1899, and is being developed as rapidly as circumstances permit. The system comprises: (1) schools of commerce, higher and inferior; (2) schools of arts and trades, classified in three degrees; (3) schools of agriculture and vine culture; (4) schools of household industry for girls; (5) trade schools for girls. The courses of instruction in the lower commercial and trade schools follow directly upon the primary course; courses of the higher order of technical schools are continuous with secondary instruction, care being taken to adapt the practical training to the local demands. In 1910 there were 1431 boys in twelve commercial schools; in 45 schools of

arts and trades, 2235; in agricultural schools, 402. In the schools of household economy, 118 girls were registered, and about the same number in trade schools. In addition to the technical schools under the charge of the Minister of Public Instruction there are five technical schools pertaining to the Ministry of Public Works. These are strictly industrial schools, intended to meet the needs of adult workmen.

Secondary and Higher Education.—Since the independence of the province was declared, the Roumanian government has shown chief solicitude for the spread of elementary education and the establishment of technical schools with a view to improving the industrial conditions of the people. Secondary and higher education have a much longer history and retain many evidences of their ecclesiastical origin. Like the Latin Church in Western Europe, the Greek Church in the East has been the patron of the arts and of learning, and has determined courses of instruction, and their final sanctions. Under a law of 1864 the reorganization of secondary education began and was promoted by a later law submitted to the legislature by Minister Maret in 1880, and adopted in 1898. In 1909 and again in 1910 the law was modified in the direction of increasing the modern character of the secondary curriculum.

Organization and Curriculum.—In accordance with these measures, secondary education is organized in two divisions of four years each. The program of the inferior division comprises religion (Orthodox Greek Church, with dispensation for pupils of other faiths), Roumanian language, French, German, and Latin, history (universal, three years, Roumanian, one year), geography, mathematics, physical and natural sciences, hygiene, vocal music, drawing, writing, gymnastics, and military drill. For those students who do not intend to complete the secondary course, a fifth class is added to the lower section, which prepares for industrial or business careers. The higher division is organized in three parallel courses, after the model of the French *lycée*, viz. mathematics and sciences, Latin and Greek; Latin and sciences. As a consequence of this bifurcation the classical course is rapidly disappearing for want of students; at present it exists in nine schools only, out of a total of twenty. The schools offering only the inferior course are termed *gymnasiums*; the higher schools, *lycées*; both divisions may be comprised in a single institution. Students are admitted to the gymnasium course by examination or by the certificate of primary studies; to the *lycée* course by the certificate showing completion of the lower secondary. As public secondary education is free there is an open road from the primary school to the highest institutions.

The secondary schools have their independent budgets and are governed by their

ROUMANIA

respective directors, who, as well as the professors, are university men and receive their appointments from the government. In 1910 there were 47 public secondary schools for boys, viz 20 lycées, 23 gymnasias, and 4 clerical seminaries. They had a total of 873 professors and 14,016 students. The appropriations for secondary education exceed those for any other department, amounting in 1910 to 4,089,341 lei (\$817,808). There are ten public secondary schools for girls, which in 1910 had 161 professors and 1615 students. These schools have hitherto followed the programs of the schools for boys; but efforts have recently been made to develop a special program for the girls' lycées after the French model.

Higher Education — Roumania has two universities: Bucharest, with five faculties, Jassy, having four. In 1910-1911 the former registered 3422 students, of which number the law faculty claimed 1575. The total included 203 women students. At Jassy in the same year 900 students were registered, of whom 340 were in the faculty of law. Among the auxiliary institutions pertaining to Bucharest are two pedagogical seminaries, a school of veterinary science, and several museums containing important collections. The budget for 1910-1911 carried an appropriation for Bucharest amounting to \$361,511 (1,897,558 lei) and for Jassy \$129,800 (649,000 lei). Bucharest is also the seat of the state schools of art and architecture.

The most important technical schools are the superior school of agriculture and school of silviculture, under the Minister of Agriculture, the school of roads and bridges under the Minister of Public Works, and the military schools under the Minister of War. There are also important private seminaries intended for the training of priests.

The entire appropriation for higher education through the Ministry of Public Instruction, including universities and special schools, was 2,999,861 lei (\$599,970); through other ministries, 1,128,929 lei (\$226,785). The clerical seminaries and other private schools under church control derive their support wholly, or in part, from the annual appropriation for the state church.

He was active in the American Institute of Instruction and the National Education Association, and the author of numerous papers on educational subjects. W. S. M.

ROUSSEAU, JEAN JACQUES — Educational reformer, born at Geneva, June 28, 1712, and died at Ermenonville, July 2, 1770. He has told the story of his life in three memorable books the *Confessions*, the *Dialogues*, and the *Reveries*. Studied in their historical places in the order of his writings, and judged in the light of a full knowledge of his genius, his services, his fortunes, his motives, and his own historical place in the world when he wrote them, these three books give us, not only the events of Rousseau's life, but also the parable of his philosophy, the example of a man who, at first instinctively, but afterwards with an earnest sense of moral responsibility, accepted for his guidance through the pleasures, perils, pains, and problems of life, the rulings of the inner law.

Philosophy of Life. — "A man's happiness and virtue," affirmed Rousseau, "are in the right use of his liberty; there is no virtue without effort, the word virtue means essential force. Virtue can belong only to an imperfect being, weak by his infirmity, strong by his will, inspired by the love of goodness. If the spirit of man were compelled to follow virtue, what merit would belong to him for taking his appointed place, in a preestablished order he had neither wish nor motive for troubling? He would be happy, it is true; but his happiness would lack the moral enjoyment that the love of virtue brings, he would lack the noble interest, the animating desire, to make her his conquest; he would lose the satisfaction of success. He would be perfect, as the angels are, but no doubt a virtuous man is worth more. The supreme happiness for man is in the contentment that follows voluntary obedience to the inner law. To deserve this contentment he exists on the earth, endowed with free choice, tempted by his passions, restrained by conscience" (*Emile*, Bk. IV.)

Rousseau's Life. — Rousseau's life, studied from an exact historical standpoint, divides itself naturally into three periods. First,

we have the long preparatory period of thirty-seven years, from 1712 to 1740, when this prophet who was to lead a return to nature in the most artificial age the world has known, and to inaugurate an effort to humanize society in an epoch when civilization seemed to have taught the privileged classes that good society has obligations of its own, emancipating it from the duties and sentiments of common humanity, was trained for this vocation by strange and varied experiences, — by personal knowledge of hardships and happiness; of poverty and freedom, of romance and disappointment, of injustice and sympathy; of the world's cruelty and secret misery; of the indestructible kindness and nobility preserved even in this state of society in many human hearts; and of the profound, unexhausted, and inexhaustible sources of beauty and enjoyment within the soul of man and in nature. Then, secondly, we have from 1740 to 1764 the "prophetic" period; when, as he has himself said, "His heart, kindled with the thought of the future happiness of the human race, and the honor of contributing to it, taught him a language worthy of so great an enterprise." This epoch, when all his great books were written, lasted fifteen years. It ended when, amongst persecutors and secret calumniators, his heart "torn by the spectacle of the hatred" of the *Motiers* peasantry and by the falling away of some of his most valued friends, he came to believe that his enemies had alienated from him the confidence of his contemporaries; and when he lost the inspiration that had sustained him, with his belief in his power to reach the hearts of his readers to serve them. Thenceforth, we have the third and last period of thirteen years, 1765 to 1778. And now we have to follow the pathetic and heroic effort of the great brave liberator of others from bondage to conventions and the world's opinions, to liberate himself from bondage to despair; and even at last from the bondage of hope of deliverance from the hatred and contempt of those for whom he had sacrificed the liberty and tranquillity he could never find again. In the *Confessions* and in the *Dialogues* we recognize his courageous effort to maintain his belief in the ultimate triumph of truth and justice. And in the *Reveries* we find that he has escaped even the bondage of this hope; and that he is made free at length, before death, by the conquest of peace and a tranquil spirit.

Writings. — The great epoch in Rousseau's life is the period of fifteen years between 1740 and 1764. In this epoch he produced the two *Discourses*, the *Essay upon Political Economy*, the *Letter to d'Alambert*, the *New Heloise*, the *Social Contract*, *Emile*, the *Letter to Christopher de Beaumont*, and the *Letters from the Mountains*; in brief the whole series of epoch-making books that contained his message to his fellow-men, a message that, as

Lord Morley has said, gave Europe a new gospel.

Dealing with different domains of life, all these books have one common purpose: to exhort men to return to nature, to escape from worldly bondage, from routine thinking, to endeavor to see themselves and the true purposes of life as they really are; and then to recognize that the true civilization of the world means to humanize and moralize the outer constitution of things, and all the laws and systems that regulate and control man's outer life, by recognizing and obeying the authority of the inner law. We have this end pursued, first of all, by the negative method of exposing injustices and prejudices hampering man's free obedience to the laws of his own conscience, and then we have the positive method, which seeks the plan of a more reasonable, more beautiful, more humane way of life.

In the two *Discourses* the negative and militant methods prevail. Here Rousseau's effort was to convince his contemporaries that, in spite of artificial adornments and an increased demand for luxuries and physical pleasures, the deterioration of human virtue and happiness is the result of an exclusively selfish and material civilization, which does not foster, but falsifies, where it cannot entirely suppress, those instinctive feelings of humanity, those natural sentiments of moral beauty that within man himself represent the immovable foundations and natural standards of right desire and noble conduct. In the series of great works which followed the *Discourses* the positive method is employed to discover "some just and sure principle of administration taking men as they are and laws as they might be."

In the *Letter to d'Alambert* and in the *New Heloise* the problems of social life and of the life of the affections are dealt with. Rousseau inquires what amusements and public ceremonies are harmful or healthful in a republic. He deals with marriage as a sacred and binding tie; with romantic as opposed to sensual love; with family life and the humane relationships between masters and servants; with the consolations and pleasures derived from a country life, with the philosophy drawn from natural religion to inspire and restore the love of virtue; to give piety, resignation, and hope in the hour of death.

In the *Essay upon Political Economy* and in the *Social Contract* Rousseau seeks to discover a rational moral foundation for civil order where men obtain a more noble freedom than in their natural state, because "to obey the impulsion of physical appetite is slavery; but to obey the law one has prescribed to oneself is liberty;" where also they obtain a moral and legitimate equality, because, "though remaining unequal in strength and genius, men become equal before the law by agreement, and by right;" where also they

A GROUP OF EDUCATIONAL REFORMERS.

arrive at the realization of the social bond of fraternity, by virtue of a compact which "is not a covenant of subjection, but of brotherhood."

Views on Education. — *Émile* — Finally, in *Émile*, we have traced for the first time the plan of a new education, as the necessary preparation for a new way of understanding life. Here, as elsewhere, it is difficult to-day to do full justice to Rousseau as an original thinker. Ideas that had the appearance of violent paradoxes when he promulgated them have now become familiar to us as the inseparable convictions of an enlightened liberalism. And one hears the ideas professed as necessary conclusions arrived at by natural processes of progress and of a liberal effort to improve and adapt old methods to the altered needs and conditions of modern times. But if by an effort of the imaginative reason we endeavor to exercise those voluntary powers of forgetfulness, so useful to the exact historical student, and deliberately throw ourselves back behind the publication of *Émile*, and take up the authoritative doctrines of education, that Rousseau found in existence, we shall discover that what he attempted, and to a large extent accomplished, by *Émile* was not any improvement in existing methods, but a complete revolution of established theories about the aims, as well as the methods, of a rational education; so that we have quite a new starting point, with the object of attaining a new goal.

Rousseau and Natural Man. — The starting point of every educational theory before Rousseau was the assumed necessity for correcting the original depravity, or stupidity, of the "natural man." And the goal was to transform and refashion this "natural man," in accordance with some one or other of the ideal types, accepted in different times by different schools, as the model of the "well-educated man."

With Rousseau, for the first time, the full and healthy development, not the transformation, of the "natural man" is the purpose of education; and again, with him, also for the first time, the "well-educated man" does not mean the man possessed of special learning; but the man best prepared to meet and master the ordinary conditions and accidents of life. The *Émile*, putting forward those, at that time, entirely paradoxical views not only of the methods but of the purposes of education, was published in 1762, that is to say, twenty-three years before Froebel's birth and at a time when Pestalozzi was just fifteen years old. It is necessary to point this out because the modern fashion is to treat the author of *Émile* as a mere "rhetorician and sentimentalist," and to ignore the solid services he had rendered in the character of a "sower of ideas," a "discoverer of sources." Thus the *Social Contract* is dismissed with sneers; and the promulgation of the doctrine of the "rights

of man" attributed to Rousseau's acknowledged disciple, Tom Paine; or else to his confessed debtors, the authors of the American Declaration of Independence. In the same way, Pestalozzi and Froebel are made the original discoverers and inventors of the principles and even of the phrases they received from the author of *Émile*; indeed, the very last fashion is to ignore Pestalozzi as well as Rousseau, and to make Froebel the father and founder of what is called the "New Education," whose principal rule is Rousseau's rule, that the just purpose of education is not to impart learning, but to develop natural faculties by suitable exercises.

By the old theory of education, it has been said, the "well-educated man" meant one who had received special literary instruction. By Rousseau's theory it meant a well-developed man, fully prepared for the conditions and accidents of human life. "In the natural order of things," says the author of *Émile*, "the universal vocation is the human state, whoso is well educated for that cannot fill badly any of those conditions that it includes. Before the vocation chosen for the child by his parents, Nature has called him to human life. To live is the trade I would teach my pupil. Upon leaving my hands, he will not be a soldier, a lawyer, nor a priest; but, if I am successful, he will deserve first of all to be called a man, and hence all that a man can and should be or do — he will, at need, be able to fit himself for, as well as any other. And though Fate may change his position, whatever profession she may call him to, he will know how to make it his own." Accepting education, however, in this sense as the development of natural faculties, and the entrance into the full possession of human life, we have to recognize that the share taken in this education by parents and teachers is comparatively limited and, if a helpful, a subordinate share. Each one of us, in Rousseau's words, undergoes three educations, and this necessarily, whether these educations tend to form or to disfigure us. First of all, there is the education of nature, through the development of our bodily, mental, and moral faculties. Secondly, there is the education of things — the lessons of experience and the influences of external surroundings. And thirdly, there is the education we receive from our fellow men and women, either deliberately bestowed upon us as instructions and counsels, or unconsciously imposed upon us by force of examples.

Education according to Nature. — Now of these three educations, the first lies absolutely beyond the human educator's control; and the second is only to a small extent and under favorable circumstances subject to his direction. And since it is evident that a mind divided against itself is not well trained, it follows that a wise educator will make his

method agree with those methods he cannot alter; in other words, he will be careful that his system of education harmonizes with the education of nature and the lessons of experience.

Here, then, we have Rousseau's first rule. A wise education follows and corresponds with the natural development of physical and mental faculties, and seeks to perfect these faculties by exercising them. And as these faculties are not all developed at once but follow a gradual process of growth, a sound method of education follows and regulates itself by this natural method; suiting its exercises at every age to the faculties that are alert and active at that age, and refraining from any effort to call into play prematurely those that are not yet healthily developed.

The educator, then, has to make his first study the order of nature in developing human faculties; and special attention is necessarily demanded in the case of those stages of human life which the individual passes through without remembering them, and which consequently remain as dark to the average man as though they belonged to the experiences of a different race.

Half the errors Rousseau found in the existing methods of education, he traced back to this failure on the teacher's part to recognize that childhood has its place in the order of human life, that consequently, like every other state, it is ruled by its own laws, derived from its own needs and interests, and not by the laws derived from the needs and interests of any future state.

"We do not understand childhood," he says. "With our false views of this condition, the further we go, the more we wander from the right path. The wisest amongst us are too apt to make the first consideration what is most desirable the future man should know; whereas the first consideration should be, what it is possible and for its own interest that the present child should learn. Our teachers will always be seeking the future man in the child, instead of attempting to understand the child as he is and before he becomes a man. . . . But this is the question I have set myself to study. I may not have seen correctly what I seek, but I believe I have at least grasped rightly what is the object of the search. . . . Humanity has its place in the order of beings, and childhood its place in the order of human life. If we attempt to change this order, we shall only produce precocious fruits, that will wither and decay before the time. We shall have learned prodigies, and childish men. Childhood has its own way of seeing, thinking, and feeling, suitable to its condition; nothing can be less reasonable than to attempt to substitute for these our own ways."

In modern ears this proposition gains acceptance, simply because Rousseau's point

of view has been adopted by all enlightened educationalists. But from the point of view of Rousseau's predecessors, who, "seeking always the man in the child," found in it always an immature and foolish sort of creature, nothing could be more reasonable, and indeed necessary, than for the teacher to substitute his own ways of seeing, thinking, and feeling for the child's ways; inasmuch as it was taken for granted the child's ways were wrong or at any rate stupid ways.

We must recollect that the child was held in very poor esteem, when it was not held in very bad esteem, by former educators. But it was not Christian theologians alone who discovered gluttony and envious rage in a babe at the breast, and supposed the evil inclinations of childhood held in check only by terror of the rod. We have the freethinker Hobbes describing the wicked man, the criminal, as a "robust child," which of course amounts to calling the child a "weak criminal," with bad inclinations restrained by want of power. Even the kind-hearted Locke has nothing better to say for the childish mind than that it is "a blank sheet of paper, whereon the educator may inscribe what characters he pleases."

It will be seen how complete a change in the purposes and method of education was the result of Rousseau's position with regard to the child and the state of childhood. The first was no longer the unregenerate or the immature man, from the moment that the second was accepted as a state of human existence having its place, like early manhood, maturity, and age, in the order of life. This once established, the rights and obligations of this state were, by Rousseau's theory, to be determined by its own interests not by the requirements of any state outside of itself. In other words, the purpose of childhood is its own perfection — and this purpose is accomplished when the child obeys the laws of its constitution and exercises the faculties that belong to its condition.

The object of the wise educator is then not to form the child to suit any system but to form a system that will suit the child. And since, by the method of nature, the faculties first developed are those physical ones necessary to the alertness of the senses and to bodily vigor, it follows that the first education must be purely physical and in other respects continue a negative one until reason and the moral sense are awake.

Negative Education. — And here we come to the clause in Rousseau's doctrine that has been constantly misunderstood by critics who will not take the pains to discover that in this theory of life all ideas hold together, and must be accepted or rejected accordingly as we recognize or repudiate the theory. "The most important and useful advice," declared the author of *Emile*, "to be given a teacher occupied with the education of children under

twelve years of age, is not to gain time, but to lose time; to postpone as long as possible the treatment of subjects that require, to understand them, the exercise of reasoning and moralizing powers." The grounds for this delay are not at all that physical development is considered of more moment than moral or intellectual training, but that, in the order of nature, Rousseau finds physical faculties are those first developed, and hence that he considers it worse than futile, mischievous, to endeavor to forestall nature, and to impose upon the child ideas and sentiments that it cannot accept in a true sense, because it has not become capable of arriving at the true knowledge of them through the exercise of its own faculties. "The most dangerous interval in human life," he says, "is from birth to the twelfth year. This is the period when, if the seeds of error or vice are sown, we are absolutely without instruments wherewith to attack them; and it may be, before the instruments are developed, the errors have struck so deep a root that one cannot reach them. If children leapt suddenly from infancy to the age of reason, the education now given them might be a suitable one. But, since the order of their natural progress is what it is, an exactly opposite course should be followed. No appeal to reason or the moral sense should be made until these faculties are healthily awake. Distrust all sentiments anterior to the power of right feeling, and hold back impressions and opinions that cannot be clear and true until power of judgment is there to show them to be right and reasonable. The first education must be purely negative; and it is plain why it should be so. Before commencing to exercise any art, one must provide one's self with the necessary instruments, and have a care that these instruments are fit for use and strong enough for wear and tear. And, thus, before beginning to think, one must exercise the senses and all bodily faculties that are the instruments of the mind. And to get the best possible use from these instruments, they must be strong and well formed; in other words, the body that supplies them must be healthy and robust."

Positive Education. — To make the senses, by suitable exercises, serviceable instruments of the mind; to cultivate physical faculties in such a way as to form just powers of observation and correct impressions of external objects; to encourage the child to take the measure of its own strength and to form an accurate estimate of its own relations to outside persons and things; and also to train it by experience to recognize what Rousseau calls beautifully, "the stern yoke of necessity beneath which all finite things must bow—" here should be the limit of all positive training during the first period of education. But with the positive training should go also the negative education; which does not consist

simply in doing nothing, but in using care to prevent any harm being done in the way of establishing convictions or awakening premature emotions which, whilst the child has not the power to grasp them truly, can come only as wrong impressions and false sentiments that will develop into irrational superstitions and incurable prejudices. "I call a positive education," Rousseau writes, "one that tends to form the mind prematurely and to instruct the child in the duties that belong to a man. I call a negative education one that tends to perfect the organs that are the instruments of knowledge directly, and that endeavors to prepare the way for reason by proper exercise of the senses. A negative education does not mean a time of idleness; far from it. It does not give virtue—it protects from vice; it does not inculcate truth—it protects from error. It disposes the child to take the path that will lead him to truth when he has reached the age to understand it, and to goodness when he has acquired the faculty of recognizing and loving it." That a negative education does not mean a time of idleness for either the teacher or the pupil, every one will discover who is at the pains of studying the second book of the *Emile*.

Sense Training. — "To exercise the senses," Rousseau says, "does not mean simply the use of them, but to use them in the way that forms powers of judgment and teaches right feelings, for we do not properly know how to feel, how to touch, to see, or to hear, until we have learnt." Thus training of the senses to be efficient and trustworthy instruments of the intellect, and, further, this obligation on the part of the educator to set his mind to the same key as his pupil's mind, in order that premature and consequently erroneous judgments may not be formed, actually demand more intelligence and devotion in the teacher than any positive method of instruction requires.

The first education ends with the first stage of life and the requirements it was formed to meet. The boy or girl, having attained the age of reason, needs other lessons; but always directed by the same plan and with the same end in view—the development of power through self-activity, and the perfecting of the instruments of knowledge.

Adolescence. — From the twelfth to the sixteenth year we have the period that Nature herself—so Rousseau declares—seems to indicate as the one most suitable for what is generally called education. During these few years, for the first and only time in life, the powers of the mind and body are in excess of the requirement of the hour. Actually, the boy has less strength than the man; but relatively and in proportion to the demands made upon him, he has more. This is "the tranquil age of intelligence, when the sleep of reason is over and before the passions are awake"

But this precious interval of leisure is too brief to press into it all the instruction required. The method followed, then, must still be the same: to strengthen the instrument of knowledge and to kindle the taste for it, to set the pupil on the right road to obtain it for himself and to provide him with rules for his own use and guidance upon the way. From this method follow certain directions that are also entirely different from the rules of the older method, when the purpose was to develop not independent power but the docile submission of the young mind to instruction given upon authority.

"As few books," Rousseau urges, "as possible. The child who reads often merely learns words. Endeavor to draw forth powers of observation, direct the attention to natural phenomena, awaken curiosity but do not satisfy it. Put your pupil on the right road to find for himself the answers to his own questions. . . . In commencing the study of the natural sciences, for instance, I would on no account introduce my pupil to a well-furnished laboratory. All this paraphernalia of instruments, all this complicated machinery, offends me. Either the child is bewildered by it and alarmed, or curiously about the instruments draws away his attention from what they serve to demonstrate. As far as possible I should wish to make our own instruments; and, having made up our minds as to the experience we require, we should set ourselves to find out for ourselves the means of obtaining it. Better that our instruments should be less perfect, if the knowledge we get by them be more complete. It is undeniable that we have clearer notions of those things we teach ourselves than of those we learn by the instruction of others. What is more, we do not accustom the reason to a servile submission to authority, but we make ourselves more ingenious, independent, and self-reliant if we resist the indolent habit of yielding our minds up to be served by others, in the same way that certain men give over their bodies to be dressed by their valets, waited upon by their lackeys, and dragged about by their horses, until their limbs become stiff and feeble through want of use. Among so many admirable methods for making the course of study easy, I would have some that made it difficult, in order to compel the mind to use healthy efforts to conquer difficulties." P. M.

ROUTINE IN SCHOOLROOM. — See SCHOOL MANAGEMENT.

ROWING. — One of the oldest and most popular sports engaged in by students. Races have been held between crews representing Cambridge and Oxford universities since 1829; they became annual races in 1856. Eton and Westminster also began to have races at the same time (1829). A large proportion of the students in the universities and public schools of Great Britain participate regularly in this sport. The Oxford and Cambridge race is held on the Thames between Putney and Mortlake, a course of four and a quarter miles. Rowing is the oldest organized sport in American colleges. The first intercollegiate athletic contest held in America was a boat race, rowed on Lake Winnepesaukee, N.H., in 1852, by crews representing Harvard and Yale. Except for interruptions in 1850, 1857, 1858, and during the Civil War, annual races have been held regularly since 1852, and many other colleges have taken up the sport. Rowing has maintained a high place in American college athletics against the competition of baseball, track athletics, football, and the many other games which have been introduced during the last fifty years. A few preparatory schools patterned after the English public schools early adopted rowing, but competition was limited to races between crews from the various "houses" within the schools. Since 1890, a considerable number of public high schools and some private schools in Boston, Springfield, New York, Philadelphia, and other cities have taken up rowing, but up to the present, comparatively few inter-school races and regattas have been held.

The history of rowing in American colleges and schools throws light on some of the vital problems in college athletics. Although a major sport and the oldest, rowing has been absolutely free from the evils of professional-

ROXBURY

ism, commercialism, and unsportsmanlike tactics which have threatened the continuance of nearly all the other college sports. It is probable that the absence of gate receipts, the limited number of contests, and the character of the sport (no personal contact between competitors) are mainly responsible for the fact that rowing has remained on a high plane of amateurism. But rowing has not escaped criticism. Educators, physicians, and laymen have made repeated charges that oarsmen are short-lived and that consumption and heart disease are frequently the cause of the premature deaths. Two investigations of this subject were made; one by Dr. William Morgan (*University Oars*, London, 1873) and the other by the writer (*Effects of Rowing on Harvard Oarsmen*, *Harvard Graduate Magazine*, March and June, 1903). The two studies showed that oarsmen live longer than men accepted by life insurance companies, and also that they rarely suffer from consumption and heart disease.

Many of the college races are over a distance of one and a half to two miles, but the most important annual contests are over a four-mile course. There is some difference of opinion concerning the danger of four-mile races. Some hold that no races should be longer than three miles, while others believe that the four-mile race is perfectly safe for carefully selected and well-trained men. Until some evidence is found showing that college men are injured by rowing in four-mile races, it is probable that the sport will continue to prosper as at present conducted.

Rowing, properly taught and supervised, is a splendid exercise to develop good posture, strength, and endurance. The period of training usually extends over three months on the rowing machines in the gymnasium and about the same length of time on the water. From the standpoint of physical and moral education, rowing is undoubtedly the most valuable of college sports. The long period of training with systematic exercise, simple food, and regular hours of sleep inculcates habits of hygienic living; the rigid discipline, the absolute obedience to the coach and captain, the spirit of sympathetic cooperation and mutual helpfulness essential for success, and the devoted friendship existing between fellow oarsmen are most valuable agents in the molding of character. ROYAL INSTITUTION OF GREAT BRITAIN, LONDON.—An association formed in 1790 at the suggestion of Sir Benjamin Thompson, Count Rumford, as an offshoot of the Society for Bettering the Condition and Increasing the Comforts of the Poor (1796). A number of fellows of the Royal Society, including Sir Joseph Banks, became interested in the proposal. The society was chartered in 1800 as the Royal Institution of Great Britain for the Promotion, Diffusion, and Extension of Science and Useful Knowledge, and was located in a house in Albemarle Street. According to Count Rumford's ideas, the Institution was to be a mechanics' institute and school of domestic science as well as a museum for exhibiting inventions discovered for man's welfare and public service. The Institution attracted much support in its early years, but, when Count Rumford relinquished it in 1801, this gradually fell off. The plans were changed, and the Institution began to devote itself to providing scientific lectures. It was saved in 1801 by Humphrey Davy, whose lectures for ten years attracted fashionable London society to the Institution. Another brilliant lecturer who helped to establish the security of the Institution was Michael Faraday (*q.v.*). In 1833 Mr John Fuller established two research professorships in chemistry and physiology, and other grants have been made. In 1896 the Davy-Faraday Laboratory was given to the Institution. Among other scientists who have worked and lectured there are Young, Brande, Frankland, Tyndall, Rayleigh, Lankester, and Dewar. The Institution is the only one of its kind in Great Britain which has professors whose main work is research rather than teaching. Short courses of lectures are given during the year, and discourses on scientific and general literary subjects are held on one evening in each week from January to June. The Institution exercised great influence during the last century in promoting general interest in the study of science, and in 1854 a number of lectures were delivered on the place of different sciences in education (*Lectures on Education*, London, 1855).

RUDOLFF, CHRISTOFF.—One of the most successful writers on algebra and com-

mercant arithmetic in Germany in the sixteenth century. He was born in Jauer about 1500, but the dates of his birth and death are unknown. He wrote three books: (1) an algebra, known as the *Coss* (see *ALGEBRA*), which appeared in 1525, and of which Stifel (*q.v.*) prepared a second edition in 1553; (2) the *Kunstliche Rechnung* (1526), which went through several editions; and (3) a collection of problems (1530). D E S.

RUGBY SCHOOL — Rugby is the fourth in antiquity of the seven Great Public Schools of England and ranks in the same position among them now. This school was founded under a deed, a will, and a codicil of Lawrence Shercliffe, citizen and grocer of London, dated in 1567 and was opened in or about 1574. Unlike the other public or grammar schools of England, great and small, it was a purely private foundation and never obtained a royal charter or other public recognition until a private Act of Parliament passed in 1777. Rugby was only a small village, there not being more than 100 houses in the whole parish. The school was no great foundation like the more than princely creations of the great pre-Reformation churchmen William of Wykeham, William Waynflete, or Thomas Wolsey, though it was due to the same motive of making a return in charity to his native place by one who like them had "thruven to thane-right" from small beginnings. Shercliffe's rise was in a humbler sphere than that of Chancellor or Bishop, he being a grocer, or dealer in spices, though as the spices were supplied to no less a person than Queen Elizabeth when Princess, and she granted him, soon after her accession, a coat of arms in which the Tudor griffin and the royal rose and fleur-de-lis as well as a bunch of dates appeared, his spices must have been highly valued. Like other successful persons who became founders, from Wykeham downwards, he dabbled in the purchase of dissolved monasteries, and the main endowment given to the school, the rectory of Brownsver, had belonged to Leicester Abbey. The foundation document was a deed poll dated 22 July, 1567, headed "The Intente of Laurence Shercliffe" by which Shercliffe with George Harrison, gentleman, and Bernard Fields, another grocer, declared "the confidence, trust and intent" for which he had bargained and sold the parsonage of Brownsver in the parish of Rugby, viz. to build near his mansion house in Rugby "a free and convent school-house" and four lodgings for four poor men and "cause an honest, discreet and learned man being a master of artes to be rejoynd to teach a free Grammar Schoole" therein to serve chiefly "for the children of Rugby and Brownsver and next for such as bee of other places therounto adjoyning." It was, in fact, to be a purely local grammar school, free from tuition fees,

for the benefit of Shercliffe's poorer neighbors. The combination of school and almshouse was common (see *HOSPITAL SCHOOLS*), and even Eton (*q.v.*) was a specimen of it. But Shercliffe's was more like the small foundation in the village of Ewelme, Oxfordshire, of the Duke of Suffolk in 1437. Like the Ewelme almshouse, Shercliffe's almsmen were to receive 7d. a week, or a penny a day each. The smallness of the school contemplated appears from the fact that the "Scholomastor" of Laurence Shercliffe of London, Grocer, was to have only "for his salary or wages the some of £12," whereas the pay of the master of the Merchant Taylors' School founded three years before was £185 a year. Even at Harrow (*q.v.*), at which no form higher than the fifth was contemplated, the pay was £26. 13s. 4d. Moreover, at Merchant Taylors' three assistant masters, a chief and two under ushers, and at Harrow an usher, were provided for, whereas there was no provision for any usher at Rugby. By Shercliffe's will personally made the same day as "The Intente," besides gifts of £5 to Rugby church and another £5 for the market cross and the bridges there, he gave £50 "towards the building of a scholre howse and alms howse in Rugbye." Even then £50 would not go far towards a school and almshouse. The school at Harrow cost more than £100, though it was only fifty-six feet by twenty feet, with two chambers for the master and usher. It would appear therefore that Shercliffe did not contemplate a school of more than fifty boys at the outside. The deed and will were made evidently in haste, owing to illness at London. A month later, 31 August, Shercliffe was at Rugby and there made a codicil without which the school would never have come to great days. It revoked a gift of £100 given in the will to buy more lands for the school, and gave instead one third part of all the founder's lands in Middlesex after his wife's death. These "lands" appear to have been no more than a single field called the Conduit Close, consisting of twenty-four acres let at £0 a year. It had probably been part of the possessions of the monastery of Charterhouse, like the thirteen and one fourth acres of land close to the "Lyttle Condyte" strent given three years before by another successful citizen, William Harper, a merchant tailor, for the endowment of Bedford Grammar School. The fortunes of both schools have been made by the land growing in value with the growth of London, Rugby definitely becoming "a great public school" when the land became buildingland. The school, built on the "part and pan" style of Warwickshire buildings of the day, appears to have been opened about 1574 under Edward Ralston, who duly qualified by taking his M.A. degree at Christ's College, Cambridge, in 1572. But on so meager a scale was the Intente carried out that

the almspeople were actually housed in the "mansion-house" with the master. At first the school spent a great deal of its time and money in Chancery, owing to suits with the founder's brother-in-law and nephew who had been given a lease of the land at a fixed rent. The first known Rugbyman to go to the university was entered at Sidney Sussex, Cambridge, in 1621. An admission register began to be kept in 1675, and shows what was probably the whole school of twenty-six boys, of whom more than half were village boys, but twelve were apparently boarders. In 1684 and 1685 there were no entries. Under Henry Holyoake, however, a chaplain of Magdalen College, Oxford (one of those ejected by King James II in his attempt to Romanize the college), who, thanks to the rising rent of the Conduit Close, enjoyed a salary of £56 a year and reigned for forty-three years from 1683, the numbers rose to about 100. The trustees and other country gentlemen of the county began to send their sons. A Speech Day was inaugurated. His successors let the school down again. But in 1748 an act of Parliament was obtained to authorize raising a mortgage on Conduit Close, with the proceeds of which a new master's house outside the then town, and eight acres of land adjoining, were purchased and a new school built. The original school was vandallistically pulled down. In 1777 a further act of Parliament was obtained for building leases of the Conduit Close and raising the salaries and number of the masters. The first master under the act was Thomas James, an Etonian. It is due to him and to his second master, George Innes, a Wykehamist, that the rise of Rugby from a local to a "great public school" took place. There is no distinction, properly speaking, between a grammar school (*g.v.*) and a public school (*g.v.*). In 1621 the Sidney Sussex Register calls Rugby a public school (*communis schola*). But there is a distinction in fact between the grammar school which is a great national school drawing its pupils from all over the kingdom, and now from the colonies as well, and the grammar school which is chiefly peopled, as Rugby was intended to be, from its immediate neighborhood. James, by introducing the Eton system of separate dames' houses for comparatively small numbers of boarders instead of all being placed in one large headmaster's house, gave the great lift to the school. He found fifty-two boys in June, 1778, he left 245 in June, 1794, and six assistant masters, instead of the one usher. The prepositor or prefect system of Eton and Winchester if not introduced by him was at all events in full swing under him. His reign did not pass without trouble, but under his successor there was a full-blown rebellion of the French Revolution type in 1792 which was only put down by the assistance of a company of soldiers. John Wooll, a Wykehamist, who followed in

1800, raised the school to a far greater height both of numbers up to 381 and of reputation. His chief material achievements at Rugby were the rebuilding of school buildings in 1800 and 1815, the making of the school close by throwing the three fields into one and the consequent development of Rugby football with its curious feature of running with the ball instead of kicking it, and the building of the first school chapel in 1819. Wooll's name is perhaps best remembered now in connection with the remark said to have been made in 1822 when he flogged a whole form of thirty-eight boys for going on strike in the middle of a lesson, that there was "Great cry and little Wooll."

Another Wykehamist succeeded in 1825, Thomas Arnold (*q.v.*), perhaps the best-known name in the educational world. Most unfairly for his predecessors, James and Wooll, he has in common repute been hailed as the maker of Rugby, the creator of the self-governing pupil system, the introducer of the system of trust in the boy and of character building into the English public school system generally. No one would have more emphatically repudiated any such misrepresentation than Arnold himself. Rugby had, as we have seen, been created a great school and enjoyed the full prefect system for seventy years before. As regards numbers, Arnold diminished and did not increase them. Bored by his Winchester antecedents he seemed to have regarded 250 as the ideal number of a school and to have reduced Rugby towards that number by wholesale weeding out of undesirables. The principle of trusting the boys and trusting them, in fact, not as slaves or subjects but as citizens was directly imitated from his own master Goddard (*q.v.*) at Winchester. As for there being anything new in the encouragement of religion or the inculcation of a high moral standard or the formation of character, it was the commonplace of every grammar school with an able master from the days of Quintilian. The great merits of Arnold were his breadth of mind and his enthusiasm, qualities not too frequently conjoined. The energy and the virility of his lessons and his sermons were an inspiration. He always urged the humane, the liberal, the advanced view of every subject, and made the dry bones of the classics and of history live. His greatness as an educator may be gauged by his having made types so different as the retiring literary churchman, Dean Stanley, and the robust lawyer, Tom Hughes, both regard him as the greatest man of the age, and in the sober biography of the former and the novel of the latter, *Tom Brown's School-days*, enshrine him for all time as the Hero as Headmaster. Except for one short interval, which ended in a suit in Chancery to reinstate a dismissed headmaster, Rugby School has well maintained the statutes and improved on the numbers as

RULE OF THREE

Arnold left it. With 570 boys, of whom 510 are boarders in nine houses at fees of £123 a year,—which contrasts strangely with the £16 a year and extras paid in 1791,—under the Rev. A. A. David, appointed in 1910, who had already achieved success as Headmaster of Clifton College, the school is second to none in strenuousness and scholarship. A. P. L.

RULES, SCHOOL.—See SCHOOL MANAGEMENT

RUNKLE, JOHN DANIEL (1822-1902).—Leader in the movement for the introduction of manual training (*q v*) in the elementary and secondary schools of the United States; was educated in academies in New York state, and was graduated from the Lawrence Scientific School of Harvard University in 1851. He was professor in the Massachusetts Institute of Technology from 1865 to 1870 and president from 1870 to 1878. His manual training exhibit from the city of Moscow, Russia, at the Centennial Exposition at Philadelphia in 1876 interested him keenly; and he became the leader of the movement that resulted in the introduction of manual training in American schools. He established the first summer school of mining (1871), and it was largely through his efforts that the Lowell School of Practical Design was established. He was editor of the *Mathematical Monthly* from 1858 to 1861. His educational publications include *Manual Element in Education*, *Report on Industrial Education*, and *Analytic Geometry*. W. S. M.

See MANUAL TRAINING.

RUNNING.—Unquestionably the oldest and most widespread athletic exercise. It occupied a prominent place in Greek physical education and has played a prominent part in all medieval and modern schemes for bodily training. The running race was the chief event of the Olympic Games (*q v*); the highest honors and rewards were bestowed upon the victor, and his name was given to the next Olympiad. Running was one of the first sports taken up by the students of British universities and public schools when athletics were introduced during the first half of the nineteenth century. The introduction of running races in American colleges dates back to the early seventies, when American students

began to imitate the athletic sports of their English brothers.

The standard running races are divided into three groups, the *sprints*, including the hundred yards and two hundred and twenty yards flat races, and the hundred and twenty yards high and the two hundred and twenty yards low hurdles, the *middle distance* runs which include the quarter mile and half mile races; and the *long distance* runs, including the one, two, five, and ten mile runs and the marathon, which is a little more than twenty-six miles.

Running is a popular and widespread exercise because it requires no elaborate or costly equipment, and it may be practiced by students of both sexes and all ages, from the elementary school to the university. The middle and long distance runs are not suitable for boys under seventeen or eighteen years, and they should never be indulged in by girls. Races of more than five or six miles are so exhausting that only a few young men possessed of exceptional physical endowments can participate in them without serious danger of permanent injury. When practiced judiciously, running contributes to the normal development of the heart and lungs, it improves posture and increases health and vigor. The risk of injury to heart and lungs is very great when running is carried to excess or when students with organic defects are allowed to participate in races. Careful medical examination of all students is essential to avoid the risk of injury to those who are not organically sound.

Prior to the year 1900 organized running races were confined to colleges and secondary schools, but since that time athletic leagues have been organized in the public elementary schools in many American cities with the result that tens of thousands of boys ten to fifteen years old practice running and engage in races from 50 to 220 yards. The results thus far have been most satisfactory. With adequate supervision by the school authorities to insure proper ethical standards and the prevention of excesses, this movement promises to contribute very materially to the physical and moral development of the future citizens.

RURAL HIGH SCHOOLS.—See HIGH SCHOOLS, section on RURAL HIGH SCHOOLS.

RURAL SCHOOLS.—Character of Rural Schools.—A term applied to schools located in the rural or country districts, as distinct from city, town, or village schools. (For historical treatment see DISTRICT SYSTEM.) In general, rural schools as found in the United States are elementary in grade, have but one teacher to the school, and minister to the educational needs of a limited and often a rather sparsely populated area known as a

RURAL SCHOOLS

school district. Sometimes, however, we find rural schools with two or more teachers, and sometimes, also, high school as well as elementary school grades. Such schools, though rural in location, are usually termed central, union, graded, or consolidated schools (*qq v*), and are not, strictly speaking, rural schools in anything but location. The typical case is the one-room rural school attended by from seven or eight to thirty or forty pupils, though fifteen to twenty pupils is a more common number. Such a school is located somewhere near the center of a certain described area from three or four to fifteen or more square miles in extent. This is commonly known as the district school, from the form of educational organization, the school usually being cared for by a locally elected representative body, usually three in number, and known as district school trustees or district school directors. The school district is the rural school unit, and a town or city is in a sense only a rural school district grown large.

Except in states using the town system (*qq*) of school organization (New England) and a few other states using the township as the school unit (see *TOWNSHIP SYSTEM*) where centralized schools are common, each county is subdivided into a varying number of such school districts. These districts are not fixed forms, but are constantly being changed and the number increased or diminished to meet the needs of new school populations or new educational conditions. This is done by some central county authority, such as the County Board of Supervisors, acting, on petition, and on the advice of the County Superintendent of Schools. An old district may be divided into two districts, a new schoolhouse is built, and a new board of district school trustees is elected to take charge of the new school. District boundary lines, too, are changed from time to time to meet new needs or, better, to suit the convenience of children in attending school. Some districts increase in population sufficiently to develop into villages or towns, and a more complex graded school system supersedes the earlier district school. A very common condition is a county containing a city school system, three or four town school systems, and then from 75 to 100 rural schools, scattered all over the county. Very few of the rural schools employ more than one teacher, and each provides elementary instruction to a small number of pupils. The work is usually graded, in a way, but commonly the instruction is in part individual and often limited entirely to the old staple school subjects. Each school is under the control of a board of three school trustees, who employ the teacher, sometimes designate the course of instruction and adopt textbooks, care for the property, and in general manage and supervise the school. (See *DISTRICT BOARDS OF TRUSTEES*, *DISTRICT SYSTEM*, *DISTRICT MEETING*.)

RURAL SCHOOLS

Rural schools are to be found in all of the American states, and in all other countries which have established state school systems. Naturally a much larger percentage of the schools are rural in some states and sections of the country than in others. In the southern and western states more rural schools are found than in the states to the north and east. In general, the percentage of rural schools in a state is proportional to the percentage of the total population living in country districts. In the agricultural states, such as Georgia, Texas, or Nebraska there is, relatively, a much larger number of small one-room rural schools than is the case in such manufacturing states as Ohio, New Jersey, or Connecticut.

In some of the states, too, the rural schools are much better organized, equipped, and more advanced than is the case in others. In part, this varies with the wealth and commercial advancement of the states, and in part it is a product of wise legislation with reference to taxation and support. One reason why the rural schools of California rank so high is that wise legislation has for long provided adequate funds with which to maintain each rural school. (See *CALIFORNIA, STATE OF*.) Even at their best, though, the rural school seldom equals a good town or city school in efficiency, and this condition has given rise to what has been termed *The Rural School Problem*. (See also special articles on *DISTRICT BOARDS OF TRUSTEES*, *DISTRICT SYSTEM*, and *DISTRICT MEETING*.)

The Rural School Problem.—Originally, nearly all of our schools were rural schools, and all were very much alike. With the growth of towns and cities, and with the development therein of new forms of educational effort to meet new and rapidly changing educational conditions, an increasing difference between rural schools on the one hand and town and city schools on the other has taken place. During the past fifty years very marked social and industrial changes have taken place in American life, and in the conditions surrounding the educational process. The cities, as a class, have made a strong effort to develop schools capable of meeting these changed conditions. Even the smaller towns have, in part, reshaped their educational systems with a similar end in view. New interest has been awakened, new types of schools have been established, new subjects of instruction have been introduced, and questioning and criticism have taken the place of an earlier contentment with educational conditions. (For a more detailed statement of these changes and of the new needs that have arisen, see under *CONSOLIDATION OF SCHOOLS*.)

The rural school, on the contrary, has responded but little to these changed conditions, and has been largely omitted in the process of reconstruction and criticism which

has taken place. During the past two decades, however, attention has been forcibly directed to this phase of our educational problem, and probably no part of the country's educational system has received more attention during recent years. Much thought has been given to the problem, much has been written on the subject, and a number of reports have been made. On closer examination, it has been seen that the problem is not a single or an isolated one, but is in reality only a part of a still larger problem, affecting almost all of the conditions surrounding rural and village life. The old social and industrial conditions, which gave rise to the little village or the rural settlement, with its little church, its little school, its general store, and its limited life, have in large part passed away. The changes affecting rural life, during the past half century, have been numerous and far-reaching, and the effect of these changes is seen to-day in the disappearance of the rural and village churches, the decline of the rural school, and the elimination of the rural store, while the whole nature of rural and village life has changed. Even the rural school problem itself is not a single or a simple one, but is in turn composed of a number of related questions, the chief of which are those (1) relating to teachers, (2) instruction, (3) maintenance, (4) organization and control, (5) supervision.

Attempts to Solve the Problem.—The first of the attempts to solve the problem was along the line of the training of the teachers. For a time this was thought to be the key to the whole problem. Normal schools were multiplied, institutes were improved, reading circles were formed, and summer sessions of normal schools and colleges were begun. (See *TEACHERS, TRAINING OF; TEACHERS, IMPROVEMENT OF, IN SERVICE*.) These agencies have rendered valuable service to the more progressive of the teaching force. Still more recently a number of states have organized teachers' training classes in the high schools of the state, in an attempt to provide for the rural schools a teaching force possessing some professional training. This has been even more valuable. (See *HIGH SCHOOLS, NORMAL TRAINING CLASSES IN*.) A few states have gone even farther, and have ordered that all teachers, after certain designated dates, shall have had some professional training. While all of these improvements have been very valuable, and the net result has been an improvement in the mental capacity and teaching skill of our village and rural teachers, they have not solved the rural school problem. The improvement of the teachers alone can never solve the rural school problem, for the reason that it does not touch the problem deep enough down.

The next attempt to solve the problem was along the line of trying to modify and enrich the instruction, and to adapt it better to the needs of country life. This idea has been a

fruitful one, and some noteworthy progress has been made in this direction. The introduction of instruction in the elements of agriculture, which has been a marked feature in the improvement of rural education, has been, during the past half-dozen years, of great benefit to the schools. (See under *AGRICULTURAL EDUCATION*.) The results of such instruction have been to awaken a new interest in the rural school, and this has, in turn, opened the way for other needed improvements. Economic conditions have helped greatly in the introduction of agricultural instruction, but this alone is only a small part of the needed change. Notwithstanding many advances here and there, it may still be said that the movement for the reorganization of the elementary school course and the introduction, in addition, of instruction in manual training and household arts, has as yet hardly been begun. Other attempts to solve the rural school problems have been made in the direction of an improvement of the school trustee. Annual meetings of all trustees in a county, or of representatives of each board of trustees, have been provided for recently by a number of states. Those attending are paid their expenses, and usually a small *per diem*, and at the meetings questions of finance and school management are considered, and the duties, powers, and functions of trustees are explained to them. The plan, while possessing merit, will do but little toward reaching or remedying fundamental conditions, for trustees change faster than they can be educated by such a plan.

While all of these expedients have been good in themselves, they have not reached the root of the matter, and the general result has been that progress in the improvement of the rural school has not been made as fast as conditions have changed. Our rural schools, while undoubtedly better than they were a generation ago, are probably still farther behind the level of good city schools than they were when the agitation for their improvement began. In any case, they are much poorer and much less effective than they ought to be. This is unnecessary, for under proper conditions as good schools can be provided in the country as in the cities and towns.

Almost all attempts to improve rural schools are limited by certain fundamental defects in present rural school organization and management, and until these can be removed no very fundamental improvement of rural school conditions is possible. Remedial measures may be applied, but fundamental changes will not be made. These fundamental defects class themselves under the headings of (1) lack of money, (2) defective organization and control, and (3) lack of adequate supervision. It is because so few of the attempted reforms have touched these underlying factors that so little fundamental progress has been made.

RURAL SCHOOLS

Maintenance of Rural Schools — An absolute prerequisite to any fundamental improvement in rural education is the provision of adequate financial support. Merely to pass laws permitting school districts to tax themselves at a higher rate will not solve this problem. In many rural communities the rate of tax for schools is already too high, and much more than is paid by cities and towns for vastly superior educational advantages. Still further, the need for additional taxation to provide better educational advantages is not only not apparent to most rural communities, but the tendencies of such to thrift, economy, and close bargaining are not conducive to increased liberality in matters of public taxation. The remedy must lie in the abandonment, in large part, of the idea that schools must be supported wholly or chiefly by strictly local taxation (see *TAXATION FOR EDUCATION*), and, in addition, in the substitution of better methods of apportioning both state and county school funds. (See *APPORTIONMENT OF SCHOOL FUNDS*.) Sixty years ago the question of public education at public expense was fought out in this country, and it was decided that the wealth of the state should educate the children of the state. Since then conditions have changed so completely that to-day there is the greatest need in most of our states for a reconsideration of the whole question, with a view to providing plans of taxation and apportionment which shall better equalize both the burdens and the advantages of education. Adequate finance lies at the basis of any marked improvement of our rural schools. There must be a doubling of available funds if anything like satisfactory results are to be obtained. Part of this increase must be obtained by increased taxation, part by changes in the methods of apportioning funds, and part by a reorganization and reconstruction of rural education itself.

Control of Rural Schools — This reorganization and reconstruction of rural education is needed chiefly along the lines of management and control. The district school system, which once doubtless rendered a valuable service, is to-day outgrown and should be abandoned as soon as possible for a system of school organization and control better adapted to modern needs and problems. The district system of school organization and control has been condemned generally by school officials for forty years, and the chief reason for its extensive retention is that the people in many states have never known any other system, and are wholly unaware how much better schools they might have under a better system of school organization and control. (For a detailed statement of the evolution and present shortcomings of the district system, see *DISTRICT SYSTEM, DISTRICT MEETING, DISTRICT BOARDS OF TRUSTEES*.) There is no educational or business reason for the large number

RURAL SCHOOLS

of school officials and the small units of organization made necessary under the district system. The system is expensive, inefficient, and unprogressive, the schools created under it are but little related to one another or to the educational needs of a county; and progress under the system is painfully slow. Instead of providing good educational advantages for all, and then leading in unbroken sequence to a high school education for all, the district system usually does nothing of the kind. By an educational reorganization of the school system of any county where the district system prevails, it would be possible to provide a good and closely integrated school system, at no materially greater cost, and with the use of fewer but better teachers than are at present employed.

Efforts have been made to secure such reorganization in a number of states, by laws permitting of the consolidation of scattered small schools into a single central school, with the provision of transportation for the pupils (See *CONSOLIDATION OF SCHOOLS*.) Wherever the population is dense enough to permit of consolidation, and where either the forces of conservatism are so weak or the system of school organization is so centralized as to make it possible to inaugurate the plan, substantial educational progress has been made. The plan is, however, difficult to inaugurate for the reason that it must be initiated and carried through by the votes of the residents of the rural districts themselves. This involves the overcoming of all of the forces of tradition and conservatism, and the stronger the district system of control, the less likely that consolidation will be inaugurated. Being devoid of any central oversight and control, too many unwise unions are likely to be formed, because they are too small, poorly arranged, or without relation to any comprehensive plan for the reorganization of rural education. Much better results would be secured, in many cases, if the county rather than the district were made the unit for action, and a comprehensive plan, worked out for the county as a whole, were first adopted as a guide to action. In states which use the township as the unit, and where consolidation takes place by townships, these difficulties are much less likely to occur, but even here a county plan possesses many advantages (See *COUNTY SYSTEM OF ADMINISTRATION, COUNTY BOARDS OF EDUCATION*.) It is possible, by the adoption of a well-thought-out plan of action and with county oversight, so to reorganize the educational resources of any county as to secure maximum educational effectiveness at a minimum cost, and to provide country people with practically as good educational advantages as are possessed by city people. It would mean the making over of our rural schools by incorporating into their curricula the special advantages now enjoyed almost alone by the cities, and

into their organization and management the best city administrative experience.

The plan, in its bare essentials, means the grouping of the schools of a county into from ten to twenty areas, or units, at each of which a central or union school is provided. By means of transportation the children are brought each day to this central school, and returned home each night. All of the one-room district schools are abandoned, and the property sold. With these schools would also go the army of district school trustees. At the concentrating points good schools are erected, planned with reference to future growth and needs. For each central school supplanting from five to a dozen district schools, according to the density of population, a small board of education is elected. A supervising principal and a corps of teachers is in charge of each school. In each central school the beginnings of high school work are offered, as well as instruction in agriculture, manual training, and the household arts. Certain of these central schools, strategically located, provide full high school instruction. Special supervisors and instructors, employed by the county school authorities, go from school to school, giving instruction in the special subjects. By a little forethought the central schools can be made centers for the community life of the area served. The educational resources of a county are thus marshaled in the most effective manner, and the struggling, isolated, and unsatisfactory little rural school, with its rural school problem, disappears from view.

Rural School Supervision.—The lack of close, adequate, and professional supervision for our rural schools is a matter of common complaint. The supervision which exists today, except in Massachusetts and in a few favored townships elsewhere and in some of the county-system (*q.v.*) states of the South, exists much more in name than in fact. The cities, with their superintendents, special supervisors, and supervising principals, look after the instruction with a care and a thoroughness almost unknown in rural schools. State laws generally require county superintendents to visit each school in the county at least once each year, but this is visitation, and not supervision. The peculiar nature of the county superintendent's office, the political basis of selection generally employed, and his many duties—clerical, financial, statistical, legal, and political—leave him little time for real supervision, and the number of scattered schools he has under his oversight makes any real supervision impossible. Yet the demand for close, adequate, and professional supervision for our rural schools cannot be resisted much longer. (See **SUPERINTENDENT OF SCHOOLS, COUNTY**.)

Attempts to solve the problem of providing adequate and professional supervision for the rural schools have been made along a number

of lines. The county superintendents themselves have long desired to secure the appointment of deputies, but with little success. The continued complaints as to needed clerical and professional assistance and the low salaries give abundant evidence that the office of county superintendent has not as yet commended itself very strongly to the people because of its professional skill. Attempts have also been made to secure supervision by laws permitting groups of districts, or the schools of a township, to unite to employ a supervising principal. Massachusetts, with its town system and compulsory legislation, has provided good supervision, and stands unique among the states. New Jersey and Ohio have made some commendable headway in securing rural supervision under the township system (*q.v.*). In some of the Southern states good supervisory conditions have been secured under the county system of organization. (See **COUNTY SYSTEM OF ADMINISTRATION; COUNTY BOARDS OF EDUCATION**, and the state school systems of FLORIDA; LOUISIANA; MARYLAND.) In the district-system states, however, voluntary unions for supervision are almost unknown. United action by district school authorities is next to impossible, and little can be expected along this line. The conservatism, jealousies, lack of insight, and lack of impulses to unified action are too strong to be overcome. Without some central compelling authority, or some central initiative with a definite plan for action, which must be accepted or rejected, as in Minnesota (*q.v.*), little can be expected in a generation to come.

The solution of the problem of providing adequate and professional supervision for the rural schools, and the small village and town schools as well, lies in part in the same direction as that of the improvement of the rural schools themselves, *viz.* in making the county rather than the district the unit, and in a thorough reorganization of rural education. With the divorce of the office of county superintendent from politics (see **SUPERINTENDENT OF SCHOOLS, COUNTY**) and with the adoption of a rational and effective system of county school administration (see **COUNTY BOARDS OF EDUCATION; COUNTY SCHOOL ADMINISTRATION**) it is possible to provide a sufficient professional supervising staff to supervise adequately and effectively all of the rural schools of a county. The more nearly the city plan of organization is copied by the counties, the more effective will the supervision become. In counties where the township unit prevails, or in counties where a comprehensive plan for the reorganization of a county's educational system is first adopted, the supervising principal of the township or central schools may take the place, in large part, of the deputy county superintendents. Each supervises his own union or central or township school, and

cooperates with the county superintendent to secure a proper integration and correlation of the educational forces of the county.

So far as possible, the supervisory force should identify themselves with the needs and interests of the parts of the county which they are to supervise, and render whatever assistance is possible in molding community sentiment with reference to education. In emergencies it ought to be possible for a supervisor to spend days at a time at a school. It should be his particular business to try to make good teachers out of the material at hand, to single out bright and promising teachers and encourage them to go for further study; to guide the schools in organization and management; to hold teachers' meetings for the discussion of purposes, methods, and results; and to strive to develop the educational system of his county as fast as the people can afford and as is consistent with sound education.

The county supervisory system is weak in almost every Northern and Western state, because of the political nature of the office, because of the lack of adequate and professional assistance, and, in many of the states, because of the strength of the old district system, with its jealousies and lack of insight into educational needs. With the county, or even the township, as the educational unit instead of the district, the way is open for effective legislation, and good supervision for the rural schools, as well as for city schools, is attainable. Compared with countries such as France or Germany, where rural school supervision is a highly professional piece of work, we have little to show. In both France and Germany the position is given only to those who have had careful professional training, who have served a good apprenticeship, and who have won their positions on examination. Appointments are then made only on the basis of ability to do the work; there is no change, except promotion, so long as satisfactory service is rendered; and the supervision is close, personal, and effective. E. P. C.

RUSH, BENJAMIN (1745-1813). — Founder of Dickinson College; was graduated from Princeton in 1760 and subsequently studied medicine at the University of Edinburgh. He was professor in the Philadelphia Medical College; surgeon in the navy during the Revolutionary War; one of the signers of the Declaration of Independence; active in the establishment of the common school system of Pennsylvania, and the acknowledged founder of Dickinson College (1783). His publications include: *Essays on the Mode of Education proper to a Republic* (1786), *Charity Schools* (1796), *Moral and Philosophical Essays* (1798), *Diseases of the Mind* (1813), and many works on medical and other scientific subjects. W. S. M.

RUSKIN, JOHN (1819-1900). — Toward the close of his life, and increasingly since, characterized as "teacher and prophet." One of the greatest masters of English prose, his whole work was educational, either as interpreter of art or as social reformer. He also wrote much on various aspects of educational theory and practice, full of luminous and productive ideas. For twelve years he was Professor of Fine Art at Oxford; also for years a guide and instructor in the Workingmen's College in London, an indefatigable lecturer on educational topics before school, college, and public audiences; a school trustee, and in various ways eager in this field, in which he was a pioneer and in which his teaching has been most fruitful.

Ruskin's own education was irregular. But, beginning at the age of three, he made many tours with his parents through England, Scotland, Wales, and the Continent; to Paris, Brussels, Waterloo, at six, down the Rhine, Switzerland, Italy, twice before he entered Oxford; visiting castles, cathedrals, art galleries ("the real cause of the bias of my after life . . . my father had a rare love for pictures"), observing the lakes and mountains, developing that love for nature and for art, which, as Bosanquet has said in his *History of Aesthetic*, enabled Ruskin to give the mind

of man a new organ for the appreciation of beauty

From 1843 (Vol. I of *The Modern Painters*) to 1860 Ruskin was an interpreter of art and of its relation to life, from 1860 to the end he was a social reformer as well, or, indeed, chiefly. In 1860 appeared Vol. V. of *The Modern Painters*; also, in the *Cornhill Magazine*, four essays on political economy, later known as *Unto this Last*, in which an appeal was made for a new social order based upon social justice and a recognition of the brotherhood of man — an appeal rejected by the England of that day with bitter scorn. This year, 1860, was the beginning of "the days of reprobation," the days when the hitherto acceptable interpreter of delightful art, recognized as having "attained the proud position of one of the greatest of all writers, living or dead, on the subject of art," was assailed with violent reprobation as a heretic and interloper, — though shortly after his death at the beginning of the new century the Regius Professor of Political Economy in the University of Oxford could say, "The political economy of to-day is the political economy of John Ruskin, and not the political economy of John Bright or of John Stuart Mill."

That the art critic should give thought to the possibility of social justice and to the reform of education was not so much a change as a development. The germ at least of his later social doctrine was contained in his early art criticism. In an early volume of *The Modern Painters* Ruskin had declared, "Humanity is at once the standard and the end of art." In *The Seven Lamps of Architecture* (1849) he wrote, "The right question to ask respecting all ornament is simply this, 'Was it done with enjoyment — was the carver happy while he was about it?'" The chapter on the Nature of the Gothic in *The Stones of Venice* (1853) is an exposition of the relation between art and the life of the workman. Gothic architecture by its irregularity permits the workman to express the thought, not of an architect, but of himself, and he can therefore find joy in his work. By 1857 (*The Political Economy of Art*), however, Ruskin had come to the sorrowful conviction that, on account of the degradation of the operative into a machine in factory production, no art (and indeed no noble life) was possible in England under the existing social and industrial system, and by 1860 he was considering, as may be seen in the closing pages of *The Modern Painters*, how far he could "with any inward satisfaction pursue the cultivation of the beautiful in art without first endeavoring to realize the good and beautiful in the world of social and political life" (*Cook, Life of John Ruskin* 1911). It was inevitable that this interpreter of art should become a social reformer. His progress was accelerated by the influence of Thomas Carlyle,

who was to the end his mentor and revered master.

Ruskin's discussions of educational theory and practice are everywhere in his works — a paragraph or two only, it may be, or many paragraphs. A good index to *Fors*, for example, contains about two hundred references to distinctively educational topics. Vol. XXXIX, i.e. the index volume, of the new library edition (George Allen and Co., London, 1912), is invaluable to one who wishes to know thoroughly the details of Ruskin's educational teaching. But his educational doctrine can in no wise be understood except in connection with the social and economic doctrines to which he had by 1860 definitely committed himself, for the subject matter of education and its methods are determined by the goal or end in view.

What, then, is to Ruskin the end in view? Certainly not a preparation for or an aid to success in life, as ordinarily understood — not at all education for the sake of "getting on" in the world. This low ideal, says Ruskin, poisons education at its source. Better no education at all than one with this false and vicious goal. The aim should not be to give some laboring men the chance of becoming masters of other laboring men, to help the few at the expense of the many. Ruskin was now, it will be remembered, attacking (successfully) the fundamental conceptions of the Manchester school of political economy, upon which was based the (at that time) prevailing brutal, inhuman, infidel, competitive system. In *Fors* he speaks of "the deliberate blasphemy" of Adam Smith's, "Thou shalt hate the Lord thy God, damn His laws, and covet thy neighbor's goods." But the question for a nation, says Ruskin, is not how much labor it employs, but how much life it produces. There is no wealth but life. That country is the richest which nourishes the greatest number of noble and happy human beings. Since there is no wealth but life, the manufacture of souls of good quality should be England's great concern, in her industrial activities even, and in her schools as a matter of course. This is the keynote of Ruskin's educational doctrine — the manufacture of souls of a good quality is the end in view.

Education is then an ethical process mainly, not an intellectual. Pupils must be taught habits of gentleness and courtesy and honesty. The best means is to teach them to *do* something, to set them to *useful* work (this treated of largely — for grown people also), set the girls to cook and sew, the boys to plowing and carpenter work. Schools should be in open places with abundant air and light, with beautiful surroundings and beautiful rooms, with portraits of noble men on the walls, with gardens, playgrounds, and cultivable lands around, with workshops, and a children's

RUSKIN

library, where the children, if they care to do so, may learn to read, each helping the other without troubling their master (this last intended for those who held that the three R's constituted the education properly furnished by the state). The schools should teach habits of worship. We live by admiration, hope, and love. There is consideration of the effect of beautiful nature on character, of the outdoor classroom, of music and dancing, as far more important than the three R's. Above all, the pupil must be induced to work for work's sake, not to surpass his fellows; let *nothing* be done through strife or vainglory, nor as a concession to the madness of the prevailing cram and examination system with its inevitable damage to health and character. In education there should be *no* selfish emulation, no self-seeking, no prizes gained by competitive examinations, and especially no "payment by results"; in short, *almost nothing* should be done in the schools which at that time was done, but most of which is now done no more.

Thomas Carlyle wrote to his brother Dr. John Carlyle, Feb. 24, 1872, "I am reading Ruskin's books in the evenings, . . . I find a real spiritual comfort in the noble fire, wrath, and inexorability with which he smites upon all base things and widespread public delusions; and insists relentlessly on having the ideal aimed at everywhere." Happily, the ideal aimed at by Ruskin has in many respects been realized. On his eightieth birthday an address was sent him signed by many of the names known in the English-speaking world, "Year by year, in ever widening extent, there is an increasing trust in your teaching, an increasing desire to realize the noble ideals you have set before mankind in words which we feel have brought nearer to our hearts the kingdom of God upon earth." His biographer, Collingwood, wrote in 1893, "His works have not been popularized abroad by translations." But his latest biographer, E. T. Cook, writes in 1911: "Since the days when he laid down his pen, he has ceased to be only an English author and has become a world author. Many of his books have been translated into French, German, Italian, Spanish, Swedish, Hungarian (his) writings have been the subject also of essays or treatises in Belgium, in Holland, in Denmark, in Switzerland." R. J.

RUSSELL, LORD JOHN (1792-1878). — English statesman, born at Westminster. Owing to delicate health he received the greater part of his early education privately, although he did attend Westminster School for one year (1803-1804). After a year of travel he entered Edinburgh University in 1809 and remained three years. In 1813, while still under age, he was elected member of Parliament for Tavistock in the Whig interest and continued in politics until within a few years of his death. From the first he was actively identified with all movements in the direction of democratic reform — the better control of elections, the abolition of religious disabilities, improved poor laws, reduction of capital punishment, and parliamentary reform. In 1831 he moved for the first reading of the Reform Bill. By 1834 he was recognized as the leader of the Whig party. In 1838 he was responsible for a bill to establish a Committee of the Privy Council to deal with education, involving the distribution of the grant of £30,000 and government inspection of schools, — thus introducing for the first time the idea of state control of education based on a state grant. In a speech on the Government Plan for Promoting National Education (June 30, 1839) he declared himself opposed to the claim of the Established Church to have sole control of state funds for education, but at the same time did not think it was possible to supersede the work of voluntary agencies. (He was himself a member of the British and Foreign School Society). He severely criticized the prevailing system of education as "a certain degree of instruction which enables the pupils to read and to write and to cypher, but it does not affect the hearts and the minds of the people instructed." The business of education is "to give such instruction as will excite the intelligence of children, raise their curiosity, teach them the meaning of words, and implant in their hearts those doctrines which are to be their guide through life." He drew attention to new methods of education which do not burden the memory and render learning irksome and disagreeable but awaken intelligence. "The only permanent security of the country is to be found in the general knowledge of the people as well of their religious duties as of their moral obligations. . . ." A compromise had, however, to be made with the Church: the inspectors of National schools were to be appointed with

the consent of the bishops to whom, as well as the Committee of the Privy Council, reports on the school were to be sent. The proposal to create an interdenominational normal school was defeated. From 1816 to 1851 Lord Russell was Prime Minister. In 1817, at Lord Russell's suggestion, paid pupil teachers were introduced in place of unpaid monitors and the training colleges were opened to them, while government grants in addition to salary were given to trained teachers. In 1853, as President of the Privy Council, Lord Russell brought in a measure, doomed to defeat, to increase the number of inspectors, to raise the standard of education, and to allow local authorities to levy a school rate, while parents were to be permitted to have a voice in the religious education of their children. At this time, while half the children of school age in the country were receiving instruction, not more than one eighth were in schools subject to inspection, that is, maintaining some standard of efficiency. In 1870, when Forster's bill was introduced, Lord Russell, though in favor of simple Bible reading with simple explanation and opposed to what he regarded as taxing Dissenters to support Church schools, gave it his support. In *Some Thoughts on National Education* he declared himself in favor of a free state-provided system of education on the model of that of Massachusetts, in which he was interested. In *Some Further Thoughts on National Education* he drew attention to the need of measures to secure better attendance and the retention of pupils until the age of fourteen, and advocated an enriched curriculum, including beyond the three R's, history, geography, the formation of taste and mechanical skill, and fostering the desire to read. Lord Russell's service to English education can best be summed up by quoting from a letter written to him by Forster in 1870. "As regards universal compulsory education, I believe we shall soon complete the building. It is hard to see how there would have been a building to complete, if you had not with great labor and in great difficulty dug the foundations in 1830."

 RUSSELL, LORD JOHN. *Recollections and Suggestions*. (London, 1875.)
 WALPOLE, SIR SPENCER. *Lord John Russell*. (London, 1901.)

RUSSELL, WILLIAM (1708-1874) — Teacher and educational writer; educated in the schools of Scotland and at the University of Glasgow. He came to America in 1817 to accept a position in an academy at Savannah, Ga. After teaching for a few years in the South, he accepted a post in the Hopkins Grammar School at New Haven. He was later simultaneously instructor of elocution and oratory in the theological seminaries at

Andover and Cambridge. He established in 1826 the *American Journal of Education*, a high-grade educational review. Excepting the short-lived *Academician*, this was the first noteworthy attempt at educational journalism in the United States. (See JOURNALISM, EDUCATIONAL.)

Mr Russell was keenly interested in the higher education of women and the organization of training schools for teachers. In 1840 he opened a private normal school at Lancaster, Mass., along Pestalozzian lines. He brought from England as instructors in his newly organized institution William J. Whittaker, a well-known art instructor, and afterwards the principal of the first normal art school in the United States, and Herman Krüss, Jr. (*q.v.*), the Pestalozzian. Dana P. Colburn (*q.v.*), author of a series of Pestalozzian arithmetics, and Sanborn Tenney (*q.v.*), author of books on natural history, formed the remainder of the teaching staff. The state normal schools in Massachusetts superseded the private establishments for the training of teachers, and Mr Russell closed his institution in 1857 and devoted his closing years to lecture and literary work.

He was for many years institute lecturer in Massachusetts and Rhode Island, and took an active part in the early American educational associations. He published several manuals for teachers, a number of works on elocution and oratory; a series of school readers, and many papers on the education of women, mutual instruction, and other educational subjects. W. S. M.

RUSSIA. — Population and Government. — Public instruction in Russia presents unparalleled difficulties by reason of the vast population to be reached and its varying conditions. According to the estimates of the Statistical Commission in 1910, the Empire comprised 103,778,100 people and an area of 8,330,000 square miles (not including the inland waters). Russia in Europe, with an area less than one fourth the total, had more than four fifths of the population, viz.: 135,859,400, or 68 inhabitants to a square mile. The Asiatic population was 24,880,000 distributed over a vast region having an average of four inhabitants to a square mile. Finland, (*q.v.*) which until very recently was treated as an allied province, had an additional population of 3,030,000. The distinction between urban and rural populations is marked in regard to all civil affairs; but there are comparatively few large cities, only twenty with more than 100,000 inhabitants each. The immense rural popu-

lation, 84 per cent of the total, is collected as a rule in small villages, and the community life forms an important feature of the social organization. Of the entire population 69.9 per cent are adherents of the Greek Church.

The government of Russia is autocratic with limitations upon the authority of the Emperor imposed by the Duma which, under imperial decree of August 8, 1905, was constituted an elective assembly with restricted legislative rights. Subsequent orders of March 6, 1906, provided that the Council of the Empire should consist of an equal number of elected members and members appointed by the Emperor, and should exercise equal legislative power with the Duma.

The divisions of the Empire for local administration are governments (78), provinces (21); and one enclavé, that of Sukhum in the Caucasus. The chief executives of these divisions and the subdivisions are not, as a rule, directly concerned with educational affairs, which have a distinct organization. The peasant communities exercise a measure of local self-government through the village assemblies, *mir*s, and the assemblies of the *volosts* (cantons). Poland, the Baltic provinces, and Finland long preserved their own administrations, but they are being rapidly assimilated into the Imperial system.

Distinctive Characteristics — Russia offers a striking contrast to other nations of Europe not only in its government but in the conditions of its intellectual development. The nations of Central and Western Europe may be studied from the standpoint of a common history, as regards their political and spiritual origins, but Russia has reached its present degree of civilization by a course peculiar to itself. While in neighboring nations there has been a steady growth in popular liberty and the restriction of imperial power, the Russian people have remained in absolute dependence upon an autocratic ruler; at the same time, the Christian religion, which in Western Europe has liberalized men's thinking, has conduced in Russia to pious superstition. The Mongolian invasion kept the country for two centuries (1221 to 1481) subject to the barbarians, the work of civilization ceased, and when the invaders were finally driven out, they left the stamp of their despotic nature upon the Russian nobles. The ignorance of the people is proved by the fact that many of the clergy, even, could not read or write. This was the complaint of the Archbishop Ghenadi to the Metropolitan, Symon, at the close of the fifteenth century. It was necessary to ordain illiterate candidates who could repeat the Psalter from memory, in order that the chants might not cease in the churches nor Christians die without absolution.

Educational Foundations — Peter the Great became sole ruler of the Empire in 1689 and immediately entered upon vast projects

for its development. His educational plans bear a striking likeness to those which Napoleon later urged for France. Both esteemed education for its practical uses and provided for special schools to train experts for the public works which they projected. The Czar created a naval academy and engineering and artillery schools, drawing the teachers largely from Great Britain. He also established lower schools known as "cypher" or arithmetic schools from the prominence given to that branch. Attendance upon these schools was obligatory for the children of noble families, all of whom were expected to serve the State in some capacity. The Church had always maintained schools for the clergy, and under an imperial order of 1721 these diocesan schools rapidly multiplied and drew students from the classes for which the arithmetic or "cypher" schools were intended; the latter declined before their more popular rivals and disappeared entirely by the middle of the eighteenth century.

The Emperor's purpose to provide an ample corps of trained experts for the public service was shown also by his sending young men of noble birth or of unusual promise to study in the higher institutions of Germany and Great Britain. At the same time he emulated the example of France and Germany by plans for an academy of sciences at St. Petersburg, which he had made his capital. The project of the academy was interrupted by his death, which occurred in 1725, but the following year the academy was formally opened by his widow and successor, Catherine, who gave it liberal endowment. The plan of the institution had been developed in advice with the eminent scientists Wolff and Leibnitz, and it comprised both an academy or association of learned men and a teaching gymnasium. The latter was organized after German models and staffed with German teachers. The institution was greatly in advance of the age in Russia, the gymnasium students were few, and the academy long depended upon foreigners for its current activities; but from the first it fulfilled two great purposes it maintained the idea of intellectual standards in an indifferent age, and it brought Russia into the culture movement of Europe. The reaction against German influences carried Elizabeth, the daughter of Peter the Great, to the throne, and at the suggestion of Lomonosov, called the father of Russian literature, this Empress founded the University of Moscow, 1755. It comprised faculties of law, medicine, and philosophy, and the attendance of students, poor but promising, was encouraged by government scholarships. The purpose of the government to bring all education under central control was indicated by a ukase issued April 29, 1757, two years after the founding of the University, ordering all foreigners desiring to teach in Russia to sub-

mit to examination at the Academy in St. Petersburg or at the University of Moscow.

The movement begun by Peter the Great, which broke up the intellectual isolation of Russia, was completed by the Empress Catherine II. At the time of her accession, 1763, the Empress was under French influences, she corresponded with Voltaire and Diderot and absorbed educational ideas from Montaigne and Rousseau, modified by the practical teachings of Basedow and Locke. The effect is seen in her plans for a school system as extensive as the Empire. In 1775 a statute for the "organization of the provinces" provided for the foundation of a charity committee in each province charged to establish schools in all the cities and populous places, in 1782 the Empress instituted a commission to develop a complete system of primary schools, including their organization, program, and textbooks, and also normal schools for the training of teachers, in 1786 the recommendations of the commission received imperial sanction. In this action the Empress was influenced by the example of Austria. Upon the advice of Joseph, the successor of Maria Theresa, she had induced Jankovics de Mnievo, who had been the associate of Felbiger in the reform of the schools of Austria-Hungary, to come to Russia to assist the school commission, consequently the beginnings of popular education in the Empire were associated with the same movement in Central Europe. The Empress Catherine also established an important school for girls at Smolny Monastery, and a "cadet school" for young men of the higher classes; both these institutions embodied her own ideas as to the appropriate training for either sex. At the same time she continued the work of her predecessor by establishing technical schools of high grade.

The Constructive Period — Broadly speaking, the history of education in the Empire from the close of Catherine's reign to 1803 is the history of a struggle between two opposing principles — the autonomy of institutions versus autocratic government. This struggle is epitomized in the principal measures pertaining to the universities and secondary schools during the first half of the nineteenth century for, with the exception of a few general regulations, primary, or popular, education excited little attention during this constructive period.

Alexander I, who ascended the throne in 1801, had acquired liberal ideas from his Swiss tutor, J. A. Harpe, and his scheme of government included a general system of public instruction. In 1802 he replaced the Schools Commission by a "Ministry of Popular Enlightenment," and to this body the control of public education, with the exception of a few institutions, was committed. The following year the country was organized into educational districts with a curator appointed by

the Emperor at the head of each. The complete plan formulated in 1804 provided for a university in each district. The three existing universities, Moscow, Vilna (in the Polish province), and Dorpat, and the new universities, two of which, Kharlkov and Kazan, were founded at once, were endowed with a large measure of independence, the university councils, comprising professors and assistant professors, being the governing bodies. A striking feature of the plan was the relation established between the primary and secondary schools (gymnasias), which together comprised a seven years' course of study complete in itself.

The French invasion of 1812 and the fears excited by the Napoleonic wars produced a revolution of feeling even in the Emperor himself. In the reaction which followed, liberal policies were abandoned, the ministry of public instruction was administratively combined with the Holy Synod (1817), ecclesiastical restrictions interfered with scholastic freedom, and the university councils were subordinated to the curators of the districts. All agencies of private instruction were closely scrutinized, and the Jesuits, whose schools had become popular with the nobility, were banished. The intellectual advance of the higher classes is indicated by an undercurrent of opposition to these restrictions, which resulted in concessions to special institutions with respect to the right of entry into the public service. Among these were the Alexander Lyceum, the Pedagogical Institute of St. Petersburg, the High School in that city, and six schools of the same type in other cities. The ancient university of Moscow escaped many of the repressive measures, as did the universities of Vilna and Dorpat, which served non-Russian populations.

The reactionary movement received fresh impulse from the Emperor Nicholas I, who succeeded his brother Alexander in 1825. The new ruler was an autocrat by temper and conviction and this natural disposition was intensified by the revolution, which broke out soon after his accession. His reign was marked by an extension of absolute authority in every direction and the increasing complexity of the bureaucratic system. The statute of December 8, 1828, relating to gymnasia and primary schools, broke up the continuity of their courses of study and limited the latter to elementary branches suited to the humblest classes, the maintenance of social distinctions and imperial ends was made a definite purpose of education; and the curricula and internal affairs of the gymnasia were placed under state inspection. Regulations of 1833-1834 provided for the state supervision of private instruction, and by a statute of 1835 the control of the district curators over the universities was extended.

Notwithstanding this repressive policy, the

efficiency of secondary and higher education in Russia increased, a result which is attributed to the wisdom and force of Uvarov, who was Minister of Public Instruction from 1833 to 1849. Of this official, it is said that while "working in entire accord with the general aims of the Emperor's policy, he was yet able by wise and liberal methods of administration to temper, within certain limits, the rigidity of the bureaucratic régime."

In striking contrast with the suppression of university life during this period was the outburst of intellectual activity, which in part was literary and national and in part speculative and of foreign origin. The latter phase was inspired largely by young professors who had studied in Western institutions and who brought back to Russia transforming influences—from France, new social doctrines, from Germany, the philosophic conceptions of Schelling and Hegel. The University of Moscow was the center of the new ideas and the seat of the celebrated controversy between Slavophiles and the advocates of Western culture. It was in vain that the Emperor increased the restrictions upon the universities and established a censorship over the instruction and lectures, as well as over the books and periodicals which the universities received; the ferment of ideas went on outside the universities, and the learned world was at variance with court and officials.

Reform Movements — The Emperor Nicholas died in 1855 just at the close of the Crimean War, which had combined with his stern policies to defer a threatening crisis in the internal affairs of the Empire. His son and successor, Alexander II, brought to the solution of the imperial problems a spirit entirely unlike that of his father, and his earliest measures showed full sympathy with the social aspirations and intellectual purposes of the liberal movement. Against the opposition of the court circle he issued the decree for the liberation of the serfs, February 19, 1861. This radical measure, which won for him the title of the "Czar Liberator," broke up the social order that had prevailed under sanction of law for nearly three centuries and had determined judicial and administrative processes.

The immediate effect of the emancipation act was disastrous from the economic standpoint. A vast body of people, variously estimated from ten million to twenty million, for the most part densely ignorant and unused to civil rights, was suddenly added to the illiterate mass of freemen, for it was estimated that, at the time, less than 1 per cent of the entire population (78,000,000) was under instruction. The act also seriously affected the smaller landed gentry, who were deprived of their possessions and their sons forced to enter the industrial world. It was necessary, therefore, to provide a system of primary edu-

cation as extended as the nation, and to increase the provision and the adjustments of secondary and higher education. At the same time, the problem of university administration demanded attention.

The university statute of 1863 restored authority to the university councils and, the following year, a scheme for the reorganization of the secondary schools and a primary school law were sanctioned. The three measures while differing in purpose all showed a decentralizing tendency, but events soon forced the Emperor to abandon his purposes.

At the moment when the spirit of reform was at its height its ardors were dampened by the Polish insurrection of 1861, and in the reaction which followed the first burst of liberal enthusiasm, the forces of discontent freed from old restraints became rampant. In the confusion which followed, student bodies were largely implicated, and the University of St. Petersburg was temporarily closed by reason of the excessive disorders. A reign of terror ensued, and under the instinct of self-preservation the government resumed a repressive policy. In 1866 Count Dmitri Tolstoy was appointed minister of public instruction, and extreme centralization again destroyed the principle of free activity. This course was confirmed by the University Commission, created by the Emperor Alexander in 1874. Finally, following the tragic circumstances of the Emperor's death, the statute of 1884 deprived the universities of the last vestige of authority. The district curators were given full control, including the appointment of the university rectors, the professors, and the deans of the faculties. This measure, adopted on account of the alarming spread of revolutionary ideas among the educated youth of Russia, failed to correct the evil; it merely repressed the intellectual life of the universities. Protests arose from every side, and after a decade of strife a provisional measure of 1905 restored the government of the universities to their respective councils.

Effect of Changing Policies upon Secondary Schools — In the changes from liberal to repressive policies secondary schools passed alternately from the control of the district curators to that of the university councils; at the same time the curriculum was the subject of successive changes of peculiar significance. By the statute of 1828, the gymnasia (typical secondary schools) had been made the preparatory stage of the universities, and in accordance with the advice of Minister Uvarov, all speculative studies were eliminated from their program, being relegated to the universities, and Latin and Greek raised to the central place. The revolution of 1848, which convulsed Western Europe, found ardent sympathizers in Russia, especially among students, and consequently classical studies then fell under suspicion as a fruitful

cause of democratic sentiments, at the close of his ministry, Uvarov put his signature to an act reversing his own policy. This was the ordinance of 1849 under which the secondary program was organized in three parallel courses. Of these courses, one alone required Latin, while Greek was confined to students intending to specialize in philology. The imperial commission on secondary schools appointed by Alexander II in 1809 restored the classics to their former place, as a corrective to excessive materialism and the frightful spirit of nihilism which possessed Russian students. By a law of July, 1871, the tripartite scheme of the gymnasium was abandoned, and by a supplementary law, 1872, *real* schools were created, nonclassical schools of a thoroughly modern type. The latest revised curriculum for the gymnasia allots 33½ per cent of the time to Latin and Greek. The *real* schools are wholly modern. In connection with these successive measures, the question of the *clases* *versus* science was exclusively considered, with an emphasis upon its political bearings unique in the history of that controversy.

Education of Women — The movement for the education of young women started by Catherine II has been steadily fostered by the government and has had profound effect upon the development of the higher and professional classes of society. The Emperor Paul, son and successor of Catherine, placed the schools for women under the patronage of his wife, the Empress Maria Feodorovna, and after her death (1825) they were committed to a special administration. In 1870 the schools were classified as gymnasiums, having a seven years' course without Latin or Greek, and progymnasia with a course of three or more years. One outcome of this provision was the struggle for university privileges which in its progress drove scores of young Russian women to the universities of France and Switzerland, where they became enthused with the spirit of liberty and returning gave new impulse to the revolutionary movement in Russia. As a means of countervailing this evil, the government provided courses of lectures for women at university centers. These finally developed into systematic courses of study with entrance examinations and standards of graduation. The last concession was the provision of medical instruction leading to a professional diploma for women.

Primary Schools — In the history of education in Russia, the primary school law of 1864 stands as the most important piece of constructive legislation, both in contrast with previous legislation on the subject (laws of 1804 and 1828), and in relation to other measures that grew out of the emancipation act. The redistribution of the land, the new judicial system, the *zemstvos* or organs of local self-government, all were seen to be

dependent for their success upon the spread of popular intelligence. The new law was intended to conserve and unify the existing agencies for that purpose. It authorized the union of schools of different denominations into a single group; required the admission of all children without distinction of creed, rank, or sex, unless separate schools were provided, and prescribed a common program for the schools, which included the three elementary branches, church, singing, and religion. The religious instruction was expressly assigned to the parish priest or to a special instructor approved by the district school council with clerical agreement. The Russian language alone was recognized as the medium of instruction. The *zemstvos* were authorized to establish and support public schools, but their control was committed to the district councils formed by the central authority. These councils, however, included representatives of the *zemstvos*. Modifications of the law of 1864 have increased the central control over the primary schools of all classes.

Extensions of the system of primary education have been made as follows. In 1872 a law was passed providing for the establishment of urban schools and the gradual transformation of the "district" schools authorized by law of 1828 into schools of the new type. The course of study for the urban schools was extended to six years or double the term of the ordinary primary school, and comprised besides religion and the three elementary branches geometry, history, and geography, elements of natural science and physics, drawing, singing, gymnastics, and additional subjects, if approved by the Minister. These schools, which might be supported by the government, or by local authorities, correspond to the higher primary schools of France.

Sunday schools intended for secular instruction and financed entirely by voluntary subscription, were recognized by the law of 1864 as part of the provision for primary education. Training seminaries or normal schools for teachers have also been established by the different authorities in conduct of primary education. Among the best of these institutions are those maintained by the local *zemstvos*.

Finally should be mentioned the statute of 1884 secured by M. Pobedonostsev, High Procurator of the Holy Synod, which virtually created side by side with the primary schools of the *zemstvos* a system of parochial primary schools. In 1891 the control of the synod was extended to the peasants' home schools, a provision for teaching the rudiments in isolated parishes, and also the Sunday schools not connected with public day schools.

Education is not compulsory, excepting in the Lutheran parishes of the Baltic districts; a bill submitted to the Council of the Empire in 1911, and still under discussion, provides

for universal free instruction with compulsory conditions

The limitations upon the expenditures of the zemstvos and the steady increase of the functions of the Holy Synod in respect to primary education are due to the same causes that have prevented the free development of higher education in the Empire. An imperial government necessarily fears freedom in even the lowest grade of education, nevertheless the exercise by the zemstvos of their rights in respect to primary schools, and the local enterprise encouraged by the ministries of commerce and agriculture are from the modern standpoint the chief facts in the recent educational movements in Russia. Their importance cannot yet be measured by statistics, but they are instinct with the spirit of national life in the fullest sense of the word.

Present Conditions — The present state of public education, comprising the general system with its various divisions and the supplementary technical divisions, is here summarized.

Organization — The central authorities for education are the Ministry of Public Instruction; The Holy Synod; the Department of the Institution of Empress Maria, and the Ministry of Finance. Other ministries, war, agriculture, etc., are responsible for special classes of schools. The Empire is organized into twelve educational districts in charge each of a curator appointed by the Emperor upon the nomination of the minister. In areas not included in these districts the governors-general control educational matters. There is also a service of inspection carried out by the district inspectors, who are nominally subordinate to the curators, but derive their authority from the minister and report directly to him. They are members of the curators' councils, which include also school directors and, when the affairs of higher education are considered, representatives of the universities.

Local initiative and independence have so far had little part in the work of public instruction, the basis for such activities is afforded, however, by the *zemstvos* or district and provincial assemblies created in 1864 as a feature of the social reorganization growing out of the liberation of the serfs. Their rôle was greatly restricted by a law of 1874 and amounts to little more than providing schools over which they have very limited supervision. Moreover, the *zemstvos* exist in only thirty-four of the seventy-eight governments, and their decisions are jealously scrutinized by the local governors and are liable to be annulled if they are not in harmony with the spirit of the court. Nevertheless, these local bodies have done much to promote schools and especially those having an agricultural character. The municipal assemblies (local *dumas*) have limited authority over city schools. The mir or village community has a voice in respect

to school expenditures. The Holy Synod is the supreme authority in ecclesiastical affairs, but subject to the Emperor in respect to its organization and its civil activities. This body has charge of parochial schools, which are parallel with, and to a certain extent antagonistic to, the schools supported by the *zemstvos*. In 1891 the peasants' home schools (*shkoly gramotnosti*) were also placed under the Holy Synod.

The Minister of Finance not only has charge of commercial schools, but is brought into close relation with the public elementary schools by the authority given him in 1900 to limit the expenditure of the *zemstvos* for their schools.

The Hebrews and other religious sects maintain their own schools as a rule; finally it should be stated that the schools of Russian Poland are separately organized, the Lutherans of the Baltic provinces long resisted all attempts to interfere with their school system, but they have gradually been brought under central control; Finland has its separate system of public instruction, much more highly developed than that of Russia. (See FINLAND; POLAND.)

Statistical Summary. — On account of the vast extent and varied conditions of the Empire, as well as the number of central authorities charged with the control of education, it is impossible to obtain for a given year an exact account of the educational provision of the Empire. The latest report of the Minister of Public Instruction, issued in 1911, comprises all the higher institutions excepting the theological seminaries pertaining to different denominations, a few technical schools belonging to other ministries, 87 per cent of the middle schools of all classes, and 67 per cent of the primary schools of the Empire. The primary schools of the Holy Synod bear about the same relation to the schools of the ministry that the church schools of England bear to the public schools, but the Synod receives the government appropriation directly and manages its schools through the bishops and local clergy. The following general summary is derived from the minister's report, supplemented by the latest particulars from other administrations. The detailed tables relate entirely to the province of the ministry.

The number of students in higher institutions in 1910 was 60,195, distributed as follows. universities and special schools of university grade, 43,600; university courses and medical institute for women, 10,576, higher technical schools, 11,929.

In middle schools of all classes, including gymnasia, teachers' seminaries, middle technical schools, etc., there were 615,937 pupils. The public primary schools and church schools enrolled 6,282,671 pupils. Thus total, which does not include Mohammedan and

RUSSIA

Hebrew schools, was equivalent to 3.8 per cent of the school population. The Hebrew schools of all grades reported for 1910 a total of 181,911 pupils, and private schools, 210,715. Hence in schools below the university grade there was a grand total of 7,300,000 pupils.

The expenditure for higher education amounted to 12,418,314 roubles (\$8,305,432), of which the government provided 50.7 per cent. The expenditure for middle schools, so far as reported, was 13,453,278 roubles (\$22,378,438), of which the government bore 31 per cent; for primary schools under the ministry of public instruction the expenditure was 63,408,240 roubles, the government supplying 72 per cent.

The government appropriation for education increased from 42,020,000 roubles in 1904 to 61,694,000 roubles in 1911.

The expenditure by the Holy Synod for religious and educational purposes in 1911 amounted to 37,567,000 roubles. The steady increase in the appropriations to the Holy Synod is intended to expand its work in primary education.

UNIVERSITY STATISTICS, 1911

UNIVERSITIES	NUMBER OF PROFESSORS AND ASSISTANTS	NUMBER OF STUDENTS
European Russia—		
St. Petersburg	230	9,886
Moscow	673	10,390
Khar'kov	210	1,174
Kievan	213	2,055
St. Vladimir in Kiev	231	6,208
Kazan	12	200
Novorossiysk (Odessa)	188	2,750
Tomsk	100	1,300
The Kingdom of Poland—		
Warsaw	98	1,091
The Baltic Provinces—		
Yur'yev, formerly Dorpat	140	2,001
Grand total	2,140	42,000

About one tenth the university students are supported by bursaries or have their tuition fees remitted. The appropriations for this purpose amounted in 1910 to 575,015 roubles 98 copecks and financial assistance to 134,044 roubles 8 copecks.

DISTRIBUTION OF STUDENTS ACCORDING TO FACULTIES, SO FAR AS REPORTED, JANUARY 1, 1910

Divinity	125
Historical-philological faculty	3,374
Law	10,150
Mathematical science	4,133
Natural science	5,301
Medicine	8,000
Oriental languages	170
Grand total	39,010

Of the entire body of students, 72 per cent were adherents of the Greek Church, Hebrews,

RUSSIA

whose quota is strictly limited by law, furnished the next highest proportion, viz 11 per cent; Roman Catholics followed with 7.4 per cent.

The special school of law, and the historical and philological institutes comprised, in 1910, 1621 students.

The women students of higher education were distributed as follows:—

SUBJECTS	ST. PETERSBURG	MOSCOW	TOTAL
Historical-philological	2150	2587	4737
Physical-mathematical	1507	1318	2825
Law	625	076	020
Medicine	1614	076	2593
	6900	1070	10,570

† Medical Institute.

The natural sciences have been greatly cultivated in Russia, and her savants have achieved distinction by their investigations in biology, chemistry, and physiology, as well as in the descriptive sciences pertaining to the vast territory of Russia. St. Petersburg and Moscow are the seats of the chief scientific associations. At the head of these is the Academy of Sciences, St. Petersburg; the Moscow Society of Naturalists and the Geographical Society, with its Caucasian and Siberian branches, are very active. The Emperor annually grants 50,000 roubles (\$25,750) from his own funds to foster scientific research publications, etc. Vilna and Kieff are noted for their libraries and depositories of ancient archives. The Imperial Clinical Institution of the Grand Duchess Elena Pavlovna at St. Petersburg has accommodation for 1208 resident patients and 60,303 ambulatory. The practical medical courses of this institution are attended by about 400 students annually.

STATISTICS OF THE HIGHER TECHNICAL SCHOOLS PERTAINING TO THE MINISTRY OF PUBLIC INSTRUCTION, 1911

TECHNICAL INSTITUTIONS European Russia	NUMBER OF PROFESSORS	NUMBER OF STUDENTS
St. Petersburg Technological Institute	100	2,300
Khar'kov Technological Institute	71	1,400
Moscow Technical School	103	3,000
Siberia—		
Tomsk Technological Institute	72	1,310
Poland—		
Novo-Alexandryskii Institute of Agronomy and Forestry	17	600
The Baltic Provinces—		
Riga Polytechnical Institute	81	1,830
Grand total	143	10,180

There were also seven veterinary schools and institutes with a total of 1,111 students.

Technical Schools of Intermediate and Lower Grade.—The development of technical education on a broad scale and as a condition of

RUSSIA

national prosperity is intimately related to the emancipation of the serfs. That act itself was due in great measure to industrial demands which necessitated the freedom of the laboring class, and it was followed immediately by industrial expansion and a call for skilled labor and expert directive power. Technical schools sprang up in various centers and were placed under different ministers without regard to the general needs of the country. This period of isolated efforts was closed in 1881 by the transfer of this class of schools to the ministry of public instruction

RUSSIA

A special department to deal with the interest was constituted in the ministry in connection with the scientific committee, and in the plan of organization adopted, which received imperial sanction, March 7, 1888, the technical schools were classified as intermediate, based upon the secondary programs and lower, following the primary schools, and differing also in the duration of the course of training. Provision was made for specialized trade schools. At the same time a commission was appointed to devise plans for the proper distribution of the different classes of technical schools

TABULAR VIEW OF MIDDLE SCHOOLS, 1910

CLASS	NUMBER	NUMBER OF INSTRUCTORS AND DIRECTORS	NUMBER OF PUPILS	EXPENDITURE	
				Total Roubles	United States Equivalent
Ministry of Public Instruction —					
Gymnasiums	294	7077	111,828		
Progymnasiums	36	604	8082	15,781,046	\$8,129,092 00
Realschools	211	3160	63,085	7,551,229	3,800,427 01
Teachers' Institutes	15		1041	463,097	238,191 00
Teachers' Seminaries	87	1070	8251	2,600,613	1,287,815.60

Institutes	30		9213		
Holy Synod (1009) —					
Seminaries	57		10,487		
Other middle schools	183		30,113		
Schools for girls	74		23,211		
Total (reported)	1800	31,878	332,101	43,453,279	22,578,438 17

1 For 10 schools registering 3200 pupils
2 Expenditures by Holy Synod are not nationalized

In addition to the middle schools included in the foregoing table, there are schools of the same grade under the ministry of war, which in 1908 had an enrollment of 18,591 pupils and Cossack schools enrolling about 9500 pupils. This would give a total of 539,530 pupils in schools intermediate between elementary schools and higher institutions, which are intended for general education either solely or combined with technical courses.

Parallel with the technical schools included

in the table are the commercial schools under the recently organized ministry of commerce, and the schools of agriculture under the ministry of agriculture. The former numbered, in 1909, 350 schools with a registration of 74,398 pupils. The schools of agriculture form a complete system including 11 middle schools with about 2000 pupils. The inclusion of the students in these specialized schools would raise the total of pupils in the class of middle schools to 615,937.

SUMMARIZED STATISTICS OF PRIMARY SCHOOLS, 1910

Total	5,672	48,281	8,025	1,217	63,707

¹ Graded in six classes.

² Ungraded one class schools with winter sessions only and programs covering a three years' course

The instruction given in the rural primary schools is generally very elementary, but training in agriculture and in manual arts is common and as a rule is excellent in quality.

RUST UNIVERSITY, HOLLY SPRINGS, MISS. — One of the Freedmen's Aid Society (F. A. S.) schools, under the management of the Methodist Episcopal Church. It was founded in 1870, largely through the influence of Dr. Richard S. Rust, who at that time was one of the most aggressive advocates of negro education in the country. The institution lays emphasis upon both literary and industrial training. (See *NEGRO EDUCATION*.) The school has about thirty teachers and from 400 to 500 students. It has sent out more than 400 graduates, who are to-day leaders of the negro race.

J. T. B.

RUTGERS COLLEGE, NEW BRUNSWICK, N. J. — Founded as *Queen's College*, November 10, 1760, by royal charter. A second charter, slightly amending the first, was granted by George III through William Franklin, governor of the Province of New Jersey, March 20, 1770. The college was called *Queen's* in honor of the royal consort, Charlotte. It was founded in response to a petition of the ministers and elders of the Reformed (Dutch) Church in America. The charter leaves the college non-sectarian, however, only providing that the president shall be communicant member of said church. In 1825 its name was changed to *Rutgers College* in honor of Colonel Henry Rutgers, a distinguished citizen of New York, a devoted leader of the Reformed Church, and a generous supporter of the college. The college work did not actually begin until after the granting of the second charter in 1770. The exigencies of war at times compelled the removal of the students from New Brunswick. For more than fifty years the college made little progress, and at times its doors were closed. During this period, however, many men were

RUTGERS COLLEGE

graduated who became greatly distinguished in Church and State. In 1800 a new site, the present campus, was secured, and Queen's Building, for many years the only building, was begun. In 1825, after a period of inactivity, a new era of life and prosperity began, and since that time the doors have never been closed and the work has constantly grown. In 1863 a department, known as the Scientific School, was established, and in 1864 the state of New Jersey declared the Trustees of Rutgers College, maintaining Rutgers Scientific School to be the "State College for the Benefit of Agriculture and the Mechanic Arts," appropriate to the Land Grant Act of the United States, 1862. This has meant a large development of instruction in science and its applications.

The courses of instruction maintained lead to the degrees of B.A., B.L., and B.S. Both Greek and Latin are required in the arts course, Greek is not required in the letters course, neither Greek nor Latin is required in the science course. There are general science courses and technical science courses. In the arts, letters and general science courses, the usual choice of electives is permitted after the freshman year. The requirements for admission to the freshman class are fifteen points for all candidates save those for the technical science courses who are now admitted with fourteen points (after 1914, fifteen points). The teaching staff (1911-1912) numbered fifty-one, and the students' enrollment was 382. Graduate students are not sought for, and special students are received only in occasional instances. Short courses in agriculture are maintained by appropriation of the State with instructors additional to those on the regular staff of the college, there were 126 students in attendance in 1911-1912. The college buildings are distributed on the Queen's Campus, the Neilson Campus, adjoining, and the College Farm, one mile distant. The buildings and grounds and equipment are valued at \$1,200,000. The endowment is \$700,000. The income for the year 1910-1911 was \$215,000.

The presidents have been Jacob Rutson Hardenbergh, D.D., 1785-1790; William Linn, S.T.D. (*pro tem.*), 1791-1794; Ira Condict, D.D., 1794-1810; John H. Livingston, S.T.D., 1810-1825; Philip Milledoler, S.T.D., 1825-1840; Abraham Bruyn Hasbrouck, LL.D., 1840-1850; Theodora Frellinghuysen, LL.D., 1850-1862; William Henry Campbell, D.D., LL.D., 1863-1881; Merrill Edwards Gates, Ph.D., LL.D., 1882-1890; Austin Scott, Ph.D., LL.D., 1891-1900; William H. S. Demarest, D.D., LL.D., 1900. The governing body is a Board of Trustees of forty-one members. The Governor of the state of New Jersey, the Attorney-General and the Chief Justice of the Supreme Court, are members *ex officio*. The other thirty-eight members are

ST. BEDE'S COLLEGE

elected by the board itself, five of them on nomination by the Association of Alumni. There is also a Board of Visitors to the Scientific School appointed by the governor.

RYERSON, EGERTON — A Canadian educator, was born in the County of Norfolk, Upper Canada (Ontario), in 1803. In 1843, Dr. Ryerson was appointed superintendent of schools for the province with permission to visit the United States and Europe to study at first hand the best systems then in operation. His observations and conclusions were set forth in a lengthy report, and many of the recommendations made in this report were embodied in the Common School Acts of 1846 and 1850. Dr. Ryerson early saw the need of the professional training of teachers, and through his efforts a Provincial Normal School was opened in Toronto. Another measure of Dr. Ryerson's which was productive of great good was the establishment in Toronto of an Educational Depository through which teachers and schools were supplied with textbooks and school apparatus at half price. See **MUSEUMS, EDUCATIONAL**.

During the thirty-three years of his superintendency Dr. Ryerson built broadly and well the foundation of the present system of common school education in Ontario. Through public addresses and conferences and by his numerous writings he sought to develop local interest in education and local activity in support of schools. He devoted much time and thought to the establishment of a system of high schools separated from and yet articulated with the elementary schools. Through his efforts uniform textbooks were adopted, ratebills gradually abolished, and an efficient system of school inspection established. In 1876, Dr. Ryerson resigned his office partly because of some friction between himself and the government of the day, but mainly because of his advanced age. He devoted the closing years of his life to literary work, his two best-known works being *A Story of My Life*, and *A History of the United Empire Loyalists*. He died in 1882. H. T. J. C.

SAINT-CYR, MAISON DE — This was one of the earliest schools for girls in France under semistate control, 1680. Some of the educational ideals of the school were unquestionably derived from Fénelon, *De l'éducation des filles* (1687). In 1703 Saint-Cyr was changed into a military hospital. F. E. F.

See MADAME DE MAINTENON.

ST. CYRAN, ABBÉ DE (Jean Baptist du Vergier d'Aurillac). — See PORT ROYALISTS.

ST. DAVID'S COLLEGE, LAMPETER, WALES — An institution founded in 1822 and opened in 1827. While primarily intended to train candidates for the ministry of the Church, especially in Wales, the college also provides courses in classics, mathematics, science, history, and Welsh, leading to the B.A. degree, either a pass or with honors. These courses extend over three years. After a course in divinity the B.D. degree is conferred on candidates who have been at least five years in priest's orders. A two-year course in divinity leading to the Licentiate in Divinity is also offered. The college is affiliated with the universities of Oxford and Cambridge. There is a faculty of nine members, and the enrollment of students in 1910-1911 was 140.

ST. FRANCIS XAVIER COLLEGE, MANHATTAN BOROUGH, N.Y. — See JESUITS, EDUCATIONAL WORK OF.

ST. GALLEN, ABBEY OF, SWITZERLAND. — An old monastery, which for a time was a prominent center of learning in the Middle Ages. It was founded about 613 by Gallus, an Irishman and friend of St. Columban. Under the patronage of Charles Martel and Pepin the early progress of the monastery was assured. About the middle of the seventh century it was attached to the Benedictine order. A school was founded, and great activity was shown in copying MSS. A chant-school was also attached to the monastery in the reign of Charlemagne. The period of its greatest renown as a seat of learning was in the ninth and tenth centuries when the Ekkehard and Notkers (*q.v.*) and many others were connected with it. From letters of Notker Balbulus, who says in one place *Salutantur ellenici fratres* and otherwise uses Greek words, it is inferred that Greek was studied at this time. But interest in learning seems to have declined, and the early humanists in their search for MSS. found at St. Gallen a large collection that had long been neglected. It was here that Poggio discovered a com-

ST. LAWRENCE COLLEGE

plete copy of Quintilian's (*q.v.*) *Institutio Oratoria*. In 1530 the abbey was reformed, and showed renewed vigor until its suppression in 1708.

ST. HUGH'S HALL, OXFORD. — See WOMEN, HIGHER EDUCATION OF; OXFORD UNIVERSITY.

ST. JOHN'S COLLEGE, ANNAPOLIS, MD — Established in 1696 as King William's School, which, in 1785, was merged into St. John's College. Among the students at that early period were George Washington Parke Custis, step-grandson, and Fairfax and Lawrence Washington, nephews of George Washington. Except for a brief period, during the Civil War, the college has been in constant operation ever since, and has sent out many distinguished sons. In 1907 an affiliation was formed with the professional schools of the University of Maryland, in Baltimore, making St. John's the Department of Arts and Sciences of the University. By this arrangement the academic and professional courses are combined to shorten the usual period demanded for the completion of these courses. The faculty consists of fourteen members directing classical, Latin-scientific, scientific, mechanical, engineering, and civil engineering courses, the first two leading to the degree of B.A. and the last three to that of B.S. Fourteen units are required for admission. A preparatory school is attached to the College and offers the equivalent of the last two years of high school work. The student body numbered 138 in 1911-1912. T. F.

ST. JOSEPH'S COLLEGE, UNIVERSITY OF MÉRAMCOOK, N.B. — Founded in 1884 and conducted by the Congregation of the Holy Cross. It was incorporated with power to grant degrees in 1868 and in 1898 a new charter giving the present name was obtained. Commercial and arts courses are offered. A preparatory course of two years is maintained. Graduates of the arts courses (four years) may receive the A.B. and B.L. degrees. The preponderating majority of the students are in the preparatory or commercial departments.

ST. LAWRENCE COLLEGE, RAMSGATE. — See GRAMMAR SCHOOLS, COLLEGE, PUBLIC SCHOOLS.

ST. LAWRENCE UNIVERSITY

ST LAWRENCE UNIVERSITY, CANTON, N.Y. — Was chartered in 1856, under the general auspices of Universalists of the state of New York. From 1868 to 1910 the trustees of the college of letters and science were elected by the New York State convention of Universalists, as are yet the trustees of the theological school. Besides these two schools, a law school and a school of agriculture are maintained. The student attendance in 1911-1912 was 651, of which 235 were in the college of letters and science. The faculty numbers forty-three.

ST LOUIS. — See EXPOSITION; INTERNATIONAL CONGRESSES OF EDUCATION.

ST. LOUIS UNIVERSITY, ST. LOUIS, MO. — Probably the oldest university west of the Mississippi, was founded in 1818 by the Rt. Rev. Louis William Du Bourg, Bishop of Louisiana. In 1827 the institution, then known as St. Louis College, was transferred to the control of the Jesuits. In 1832 the College assumed its present style and received its charter by act of the Missouri Legislature. The university's first professional school, that of divinity, was opened in 1834, medicine followed in 1836, and law in 1843. For some years these schools flourished, but straitened circumstances, caused largely by the unsettled financial and political conditions of the times, led to their discontinuance. The law school was closed in 1847, the medical in 1855, and divinity in 1860. From 1860 until 1889 the university consisted of the College of Liberal Arts with its preparatory schools, and postgraduate courses in literature, philosophy, and science. In 1889 the work of reconstructing the university began by the foundation of the graduate school of philosophy. In 1899 the divinity school was reestablished, the school of medicine was reopened in 1903, the dental school, the institute of law, and the school of advanced science, in 1908; and the school of commerce and finance, and the department of seismology and meteorology, in 1910.

From its inception the university exercised a direct and far-reaching influence in the colonization and civilization of the middle and far West, and within a few years after the coming of the Jesuits to St. Louis more than forty ecclesiastical and educational foundations were made by professors and alumni of the university. The missionary work of Pierre Jean De Smet, a member of the faculty for nearly fifty years, is famous, the ascendancy which he gained over the Indian tribes was exercised more than once at the request of the government of the United States in preventing outbreaks between the aborigines and the white settlers. Seconding De Smet were Paul Ponzighone and the brothers Adrian and Christian Hoecken, whose missions

ST. PAUL'S SCHOOL

were centers of civilization from which have sprung many flourishing communities in Kansas, Nebraska, Iowa, and Missouri. Nine of the schools founded by members of the university faculty are now well-established colleges or universities in the West.

In 1912 the teaching staff numbered 252 and the total student body 1381. Of the student body, 497 were enrolled in the college, 83 in divinity (Ph D. required for admission), 63 in the graduate schools, and the remainder in the various professional and technical schools. Fifteen units are required for admission to the college.

The student body is drawn from thirty-three states and fourteen foreign countries. The university is governed by a self-perpetuating board of trustees who are members of the Society of Jesus. Associated with the trustees is an advisory board appointed by the trustees. While the control of the university is thus vested ultimately in the Society of Jesus, it is not the policy of the university to inculcate formal religious teaching in the professional schools. About 60 per cent of the students in these schools profess creeds other than that of the Catholic Church.

The university library contains about 80,000 volumes and a fair collection of medieval and early American manuscripts. The value of the university buildings (eleven in number), grounds, and equipment is about \$1,300,000. The president of the university is the Very Rev Alexander J. Burrowes,

SABBATICAL YEAR IN UNIVERSITY, COLLEGE, AND SCHOOL. — By an ancient law the Israelites were commanded every seventh year (the sabbatical year) to suffer their fields and vineyards to rest or to be untilled. The term sabbatical year is now widely used among colleges and universities to mean an intermission of labor, first, for rest or pleasure, or, second, for research or study uninterrupted by teaching. The value of granting leaves of absence to teachers in order to freshen and to add new stimulus to their work is heartily conceded by educators. The practice each year is being extended as colleges gain in financial strength, and the provisions under which college teachers are enabled to take such intermission from their work are becoming more and more definitely formulated.

In the public mind, however, especially in states where the pioneer struggle is unforgetten, the idea of the sabbatical year is not readily accepted. It is considered an unjustified luxury, and for this reason the practice is gaining only its first foothold in state and municipal institutions. In this matter tax-supported institutions reflect their sensitiveness to the popular sentiments of their constituencies.

In comparatively few colleges and universities are the privileges of the sabbatical year formulated in the statutes. But in a majority of the institutions the practice is more or less informally in force. The conditions under which the privilege is granted fall under two main heads, — (1) The most usual practice is to grant to professors, assistant professors, or adjunct professors a leave of one year in seven on half salary. The acceptance of such a leave implies, as a rule, that the professor will return to his position after the period of leave; a definite contract to ensure such return is seldom asked. Harvard, Columbia, Bryn Mawr, University of Illinois, University of Missouri, and Wellesley are illustrations under this first head in which

SABBATICAL YEAR

the privilege is definitely formulated. The practice is also more or less regularly followed at Carleton, Williams, Stanford, Northwestern, Brown, Boston University, Ripon, University of Minnesota, Randolph-Macon, Vassar, and others. At Stanford the professor may accept leave on half pay for a half year in each three and one half years of service, or for an entire year in each seven years; at Columbia the professor has the alternative of one half year in seven on full pay or of one year in seven on half pay. At the University of Wooster one professor in the institution each year is given leave on full pay; at Amherst, Bowdoin, and Miami, not more than two professors may be absent at one time. At Heloit one half year in seven is given on full pay. At Oberlin after ten years of service leave is granted for one year on full pay. At the University of California two thirds of the salary is granted, and the professor may leave on this basis either for one half year after each three years of service, or for one year in each seven years. At Iowa College "part pay" is irregularly granted. (2) A second group of institutions has followed a practice of granting leave by giving to the absent professor the difference between his salary and the amount necessary to employ a substitute. This means that the professor receives from one fourth to one half of his salary while absent. In most cases, the plan has not recommended itself, for it lowers the teaching efficiency of an institution, the substitute being secured at low cost. For this reason the plan was recently discontinued at the University of Georgia. This method is seldom formulated into a statute by colleges; it is merely a custom occasionally in force. Illustrations are Colorado College, Western Reserve, Wells, Rose Polytechnic, Mount Holyoke, Trinity, Tufts.

The granting of leave of absence to teachers in high and elementary schools has not yet been systematized in this country. The most that some teachers can expect is an individual arrangement by which they are granted leave of absence for study without pay but with a definite promise of reemployment at the end of that term. A beginning has, however, been made at Cambridge, Brookline, Boston, and Newton, Mass., where the sabbatical year has been definitely introduced. At Cambridge a teacher may obtain leave of absence for a year after ten years of service, receiving one third of his or her annual salary, the leave being spent in study or travel. At Boston applicants for leave of absence must state the purpose for which they desire the leave. One year after seven years of service is granted on half pay for purposes of study or travel; while for purposes of rest one year after twenty years of service may be obtained. Teachers who receive leave of absence are bound by contract to serve in Boston for three years after their return. The conditions at

SACROBOSCO

Newton are similar to those in Boston. In 1908 Rochester, N Y, adopted a plan similar to that of Boston.

England — The sabbatical term is unknown in the English universities and higher institutions of learning and in elementary schools. A few private secondary schools for boys and girls have arranged to grant short periods of absence, ranging from three to six months, on half or full pay, but those instances are not sufficient to warrant any statement as to the further adoption of the system.

SACROBOSCO, JOANNES DE (HOLYWOOD or HALIFAX) (fl 1230). — An early English mathematician born at Holywood (now Halifax), in Yorkshire, Sacrobosco being the Latinized form of Holywood. Sacrobosco studied at Oxford and taught astronomy and mathematics at Paris. His astronomical work, *De sphaera mundi*, was popular for three centuries. The arithmetical work, *Tractatus de arte numerandi*, is a collection of rules without proofs or examples. It is the first work of the kind in the now numerals written by an Englishman. In it are given eleven chapters on the distinct operations in arithmetic: numeratio, additio, subtractio, mediatio, duplatio, multiplicatio, divisio, progressio, perambulum ad radicem extractionem, and extractio radicem in cubicis. Two other works are also known to have been written by Sacrobosco: *De computo ecclesiastico*, or *De anni ratione*, and *De Astrolabio*.

SAGE, RUSSELL, FOUNDATION. — An organization incorporated in 1907 for the "improvement of social and living conditions in the United States of America" by such means as the trustees think fit without encroaching on work that is already done effectively by any other body. The Foundation, which is in the control of a body of nine trustees, was established by Mrs. Russell Sage, who gave an endowment of \$10,000,000. It is not the intention of the Foundation to relieve individual or family needs, but to eradicate poverty by an investigation of its causes. No aid is given to churches of any denomination. The work of the Foundation is distributed among several departments which conduct propagandist and research work. The following is an enumeration of some of the directions of the activities and studies of the Foundation:

vol. v — n

SAILER

Campaigns against tuberculosis, the prevention of blindness, especially among children, the provision of public recreation; medical inspection of schools, school gardens; the care of children in institutions, charity organization; workmen's and other kinds of small insurances; the Pittsburgh Survey, a study of the social and economic conditions in a large city; housing problems in large cities; the question of backward children, retardation and elimination, open-air schools, wider use of the school plant, provision of meals in schools. This Foundation has also assisted towards the establishment of departments for the training of social investigators in schools of philanthropy in Boston, New York, Chicago, and St. Louis. Generally, the educational studies and research of the Foundation are directed to establishing methods of measuring educational results. John M. Glenn is the secretary and general director of the Foundation, which has its offices in New York.

SAILER, JOHANN MICHAEL (1751-1832) — One of the most prominent Catholic German educators, was born as the son of a shoemaker at Aresing, near Augsburg, in Bavaria, studied at the gymnasium in Munich, and, in 1770, entered the Jesuit College at Landsberg as a novice. When the order was abolished, in 1773, he went to the University of Ingolstadt, where he devoted himself to theology, philosophy, and mathematics. In 1775 he was consecrated as a priest, and in 1780 he received the appointment as professor of dogmatic theology at Ingolstadt. Later on (1784) he was made professor of pastoral theology, ethics, and dogmatics at the episcopal seminary at Dillingen. In consequence of his tolerant religious views, which brought him in contact with many Protestant scholars, he made some powerful enemies who succeeded in having him removed from his position in 1794. In 1799, however, he was again called to the University of Ingolstadt. The following year the university was removed to Landshut, and Sailer remained there for twenty years as professor of morals and practical theology. He lectured also on pedagogy and wrote his chief work, *Über Erziehung für Erzieher* (*On Education, for Educators*), which appeared in 1807, being enthusiastically hailed by Diesterweg (*g.v.*). In 1829 he was made Bishop of Regensburg; in this position he died in 1832, leaving behind him the fame not only of a great thinker and educator but of a man of peculiar sweetness and nobility of character. His complete works, in forty volumes, were published by Widener, Sulzbach, 1830-1842.

SALAMANCA, UNIVERSITY OF, SPAIN.

—One of the most famous and influential of medieval universities. The chapter school which had previously existed was given the status of a university by Alfonso IX before 1230, but did not meet with success. It was refounded by Ferdinand III of Castile and received a charter of privileges in 1242. Progress was not made, however, until the reign of Alfonso X, the Wise, who gave the university a new charter in 1254. A Bull confirming the university was granted in 1255. Salamanca in its constitution (the *Siete Partidas* was issued in 1263 for all Spanish universities) was based largely on the Bologna organization, with the exception that the historical connection with the Cathedral and hence with the Bishops and *Magister Scholarum* was retained to some extent. Alfonso X gave an endowment and encouraged the study of both branches of law, a field for which the university gained great repute in the fourteenth century, doctors of law ranking as a superior social class. At the same period a degree and practical instruction in music were given, and a mayor of music was included among the teaching body. Under Ferdinand IV and Pope Boniface VIII the university was endowed with the *tertia ecclesiarum*, an arrangement which led to difficulties with the Cathedral and the suspension of the university activities from 1310 to 1313. In 1380 chairs were established in theology on the recommendation of the Papal Legato, who as Benedict XIII showed much favor to the university and granted new statutes in 1411 in which student government was largely recognized, subject to the authority in certain directions of the Chancellor, formerly the *Scholasticus* or *Magister Scholarum*. In the fourteenth and fifteenth centuries the university was noted for its theological studies and was regarded in opposition to Paris as the center of orthodoxy. At the same time its breadth of view and independence are illustrated by the lectures on the Copernican system and the encouragement given to Columbus. About this period a number of colleges were established. The University of Salamanca reached the height of its fame and success in the sixteenth century, when it was attended by nearly 7000 students. A decline set in, however, and became more and more rapid; studies were neglected; empty disputations flourished; and the number of students dwindled. An attempt to resuscitate the ancient glories was made in 1709-1777, but

SALLUST

these efforts were nullified by the political disturbances at the beginning of the new century. The present organization goes back to the law of Sept. 3, 1857, passed under Isabella II. There are now the following faculties: philosophy and letters, law, sciences, and medicine. The enrollment in 1911 was about 1200.

SALISBURY, JOHN OF. — See JOHN OF SALISBURY.

SALLUST. — C. Sallustius Crispus, politician, Caesarian partisan, and historian (60-34 B. C.), was regarded by Roman critics as the Thucydides of Rome. Compared with his great Greek model, he is, however, distinctly inferior, but owing to his use of original sources, his critical and philosophical judgment, he well deserves to be regarded as the father of Latin scientific history. Though obscured for a time by the greater brilliancy of his later contemporary, Livy, he regained his ascendancy in the Silver Age, and left a strong impress upon Seneca and Tacitus.

His *Historiae*, in five books, have perished, but we still have two extensive monographs, the story of the conspiracy of Catiline (*bellum Catilinæ*) and of the war against Jugurtha (*bellum Jugurthinum*). Of these the former occupied at one time an important place in the secondary Latin curriculum and even now,

SALOMON

when time allows, is often read, in conjunction with the Catilinian speeches of Cicero, upon which it furnishes a valuable commentary, showing, though grudgingly, for Sallust was a political opponent of Cicero, the gravity of the crisis, and the great value of Cicero's services to the state at this juncture.

In reading the *Catilina* in the schools, the philosophic introduction, amounting to about one fourth of the whole, may well be omitted or deferred. This is a masterly analysis of the causes of the degeneracy of Roman morals at this time, but it requires considerable maturity of mind on the part of the students. Particular attention should, however, be devoted to the speeches of Cato and Cæsar, both as examples of a different type of oratory, and as indicating the political conditions which were to lead naturally in a few years to the dictatorship of Cæsar.

The style of Sallust, while Ciceronian, is characterized by archaizing colloquialisms and rhetorical devices, for which may be consulted Constans, *de sermone Sallustiano* (Paris, 1880), and Uri, *Quatenus apud S sermonis pleben vestigia apparent* (Paris, 1885).

The most important critical editions are by Dietsch (Leipzig, 1864, with index) and Jordan (Berlin, 1887). The most available editions of the *Catilina* and *Jugurtha* are by Long (revised by Fraser, London, 1890), and Capes (Oxford, 1880). There are numerous school editions of the *Catilina*. G. L.

SALOMON, OTTO. — See MANUAL TRAINING, SLOYD.

SALVANDY, NARCISSE ACHILLE, COMTE DE (1795-1856). — French historian, statesman, and educator. He was a member of the chamber of deputies throughout nearly the whole existence of the July monarchy (1830-1848), being twice minister of public instruction (1837-1839; 1845-1848), and twice absent in the diplomatic service (Madrid, 1841-1843; Turin, 1843-1845). He was elected member of the French Academy in 1835. The most important work of his career was his occupancy of the portfolio of public instruction. He organized the education department, the university was practically re-founded; the inspection of primary schools was strengthened by the appointment of sub-inspectors and the fixing of the salary scale, the *salles d'asile* were reorganized so as to make them educational rather than mere charitable institutions (1837); and a bill for the fundamental reorganization of the whole primary school scheme submitted during his second term as minister was brought to an untimely end by the revolution of 1848. This likewise saw the close of his political career. He was the author of *La Coalition et la France* (1810), *Histoire de Pologne avant et sous le Roi Jean Sobieski* (3 vols., 1827-1829); *Seize mois, ou*

SALZMANN, CHRISTIAN GOTTHILF (1744-1811). — A prominent German educator of the Philanthropist school, was born as the son of a Protestant pastor at Sommerda, near Erfurt, Thuringen. He received his first education from his father and then attended for two years the gymnasium in Langensalza. From 1761 to 1764 he studied theology in Jena; in 1768 he became pastor in a little village near Erfurt, and later in Erfurt itself. From there he was called as preacher to the Dessau Philanthropinum, where for three years he directed the devotional exercises and gave religious instruction. In 1784 he founded the educational institution of Schnepfenthal, near Gotha, the only one of the Philanthropist institutions which has existed to our times. This school he directed until his death. Among his first teachers was Guts Muths (q.v.), the founder of the German system of gymnastic instruction, one of his first pupils was Karl Ritter (q.v.), the famous geographer. Salzmann's educational ideas were based on those of Basedow (q.v.), but he was saner, less sensational, and more practical than Basedow, and for this reason his direct results were more lasting. His school emphasized physical education, manual training, nature study, observation of familiar objects, and inculcation of the pupils to self-activity. In the teaching of the foreign languages, he discarded the old grammatical method and relied on speaking the language and on careful and extended reading. The ambition of the pupils was stimulated by an elaborate system of rewards, and the chief aim of the school was to reproduce as much as possible the conditions of a happy and busy family life in order to educate its pupils to become, as Salzmann says, "healthy, rational, good, and cheerful human beings."

Among the many writings of Salzmann, most of which aim to convey his thoughts on education under the form of fiction, two are especially noteworthy, his *Krebsbüchlein* (*Little Crab Book*), 1780, and *Ameisenbüchlein* (*Little Ant Book*), 1806, both of which were very widely read and frequently reprinted. The former is a biting satire on the prevalent home education of his time; its subtitle is *Direction towards an Irrational Education of Children*. The plan of the book may be sufficiently indicated by the titles of some of the chapters, as *How to teach children to lie*, *How to make them stupid, vain*, etc. The *Ameisenbüchlein* contains Salzmann's maturest thoughts on education; it calls upon the educator to educate himself. In it he proclaims

SAN SALVADOR

as a "confession of faith" for a teacher the maxim that "the causes of all the faults and vices of his pupils an educator must try to find in himself."

SAN SALVADOR, EDUCATION IN THE REPUBLIC OF. — San Salvador was freed from Spanish rule in 1821, and until 1817 formed a division in the Central American Federation, becoming an independent republic upon the dissolution of this union. The constitution adopted in 1821 under the Federation has been slightly modified by amendments, the last in 1886. The area of the republic is 7225 square miles and its population 1,070,000 (census 1910). For administrative purposes the country is divided into fourteen departments which are independent in respect to educational matters, subject, however, to the general law under which public primary education is declared free, obligatory, and secular. The government maintains a system of primary schools to serve as models for those supported by the departments and by cities.

The chief educational authority is the minister of public instruction, who is assisted by a council of public instruction, elected by the members of the university faculty.

At the present time there is much activity in respect to the development of the internal resources of the country, the construction of railroads, and the establishment of telegraphic and telephone communication.

In his annual message at the opening of the Congress of the Republic, February, 1912, President Araujo submitted the following particulars as to the public schools: The number of primary schools in the Republic in the scholastic year 1911 was 486, — 203 for boys, 200 for girls, and 83 mixed. Teachers to the number of 851 found employment in these schools, of these there were 382 men and 469 women. The number of pupils enrolled was 21,500, of whom 11,633 were girls and 9866 boys. The total population of the Republic of school age was 173,595 females and 82,511 males. The government expenditure for public schools amounted to \$293,003.

During the session of 1912 the Congress of Salvador passed a law subventioning to the amount of 200 pesos per month the "Colegio Moderno" (Modern College) of Santa Ana, and arranged for the establishment of colleges for girls at Robasco and Sonsonate and for the founding of elementary industrial schools in

SANTO DOMINGO

the cities of San Salvador, Santa Ana, and San Miguel.

At the capital, San Salvador, there is a university with faculties of jurisprudence, medicine, natural sciences, and engineering, and also a national library.

SANTO DOMINGO, EDUCATION IN. — The Republic of Santo Domingo occupies the eastern portion of the island of the same name, covering an area of about 18,000 square miles and having an estimated population of 700,000.

The political vicissitudes of the country since its separation from Haiti in 1844, the

SAPIDUS

mixture of races, and the tropical climate have all combined to prevent any marked progress in education. A decided impulse was given to this cause in 1884 under the lead of President Billini, primary instruction was declared free and obligatory, and the outlines of a system were issued by the minister of public instruction. French models were followed in this plan, the schools being classified as primary, higher primary, normal, lycées and colleges, preparing students for the bachelor's degree, schools for girls, schools of arts and trades, universities, and higher professional and technical schools. This ambitious scheme has been very imperfectly realized; but examples of nearly every class of schools named are found in the republic.

The establishment of primary schools is left to the communes with the aid of government grants, but little interest is shown in respect to popular education outside of the few cities. Official reports for 1910 give a total of 526 primary schools, parochial and communal, with 18,810 pupils, equivalent to 2 per cent of the population.

The latest developments in education have reference to the agricultural interests of the republic. At Cienega a government school for the cultivation of tobacco has been established, and an agricultural school was opened at San Cristobal in April, 1911.

The most successful schools for girls are maintained by the teaching sisterhoods of the Catholic Church, while the similar schools for boys in charge of the religious orders have paid much attention to the manual arts.

SAPIDUS, JOHANNES (1490-1561).—The Latinized name of Hans Witz, a nephew of Wimpfeling and a German humanist. He was born at Schlestadt, then a center of humanistic studies, and after attending the gymnasium there, he studied in Paris. He later became rector of the gymnasium of his native town and soon had one of the most flourishing schools in the country. It is thought that he introduced Greek into the school. Thomas Plattet (*q.v.*), who was a pupil at Schlestadt for a time, says that in his day there were 900 pupils in attendance, "some of them well-bred, learned scholars." Owing to his sympathies with the Reformation movement, Sapidus was compelled to leave Schlestadt, which remained Catholic. In 1538 he became a teacher at the gymnasium at Strassburg under Sturm, who became his

SARAVIA

son-in-law, and there remained until his death. A play written by Sapidus, *Lazarus Redivivus, Comedia Nova et Sacra*, was performed on the removal of the school into new buildings in 1539.

SARATOV, IMPERIAL NICHOLAS UNIVERSITY.—See RUSSIA, EDUCATION IN.

SARAVIA, ADRIAN A. (1531-1613).—Schoolmaster and divine, who affords a typical instance of the influence of religious refugees on the history of English education. Born in 1531, at Hesdin in Artois, his father was Spanish, his mother Flemish, and both of them became Protestants. Adrian was trained for the university, and entered that of Antwerp. In 1560 Saravia withdrew to the Channel Islands, on account of religious troubles in the Low Countries. After studying at Oxford in 1561, he returned to the Channel Islands in 1563 and became head master of Elizabeth College, Guernsey. In 1576 he had become head master of Southampton Grammar School, and there remain entries in the town records of payments to him for the expenses of his boys' theatrical performances. He was also a prominent member of the French refugees' Church of Domus Dei at Southampton.

Amongst his pupils were Joshua Sylvester (translator from the French of the *Divine Weeks and Works of Du Bartas*), from 1573 to 1576, Robert Ashley, the translator from the French of Louis Leroy (Ludovicius Regius), and Sir Thomas Lake, who became Latin Secretary to King James I. Saravia's Southampton School probably ranks as the first grammar school in England in which French was systematically taught. Ashley says "It was a rule all should speak French: he who spoke English, though only a sentence, was obliged to wear a fool's cap at meals, and to continue to wear it till he caught another in the same fault." Saravia had left England by 1582 for a professorship of divinity at Leyden, but returned to England and was successively prebendary of Gloucester, of Canterbury, and, in 1601, of Westminster. In 1607-1611 he was one of the translators of the English Bible, on the committee of three to translate Genesis to II Kings. F. W.

SARMIENTO, DOMINGO FAUSTINO (1811–1888) — South American educator and statesman, was largely self-educated. He began his career as a teacher in Argentina; and in 1836 he established a school for girls which he directed until 1842, when he organized the first South American normal school. He went to Europe in 1845 to study educational conditions. Here he found a copy of Horace Mann's *Seventh Report to the State Board of Education*. This brought him to America, where he spent some months in Massachusetts with Horace Mann (*q.v.*) and in Connecticut with Henry Barnard (*q.v.*). He attended many educational associations and teachers' institutes and visited a large number of schools. The results of this visit were embodied in a book (in Spanish), *Schools the Basis of Prosperity in a Republic*. He returned to Argentina and engaged in educational work. In 1857 he became minister of public instruction. He was sent to the United States as minister from Argentina in 1865, and three years later he was elected president of the Republic of Argentina. His educational publications include *De la Educación Popular* (1848), *Memoria sobre Instrucción Primaria* (1849), *Las Escuelas base de la Prosperidad en los Estados Unidos* (1868), and a life of Abraham Lincoln. He also translated into Spanish considerable portions of Barnard's *American Journal of Education*. Sarmiento is generally called "the Horace Mann of South America."

SASKATCHEWAN, UNIVERSITY OF, SASKATOON, CANADA. — An institution established by a Provincial Act of 1907. Classes in arts and science were opened in temporary buildings in 1909. A college of agriculture has also been added, and the educational work formerly conducted by the Department of Agriculture has been transferred to the university. The university site, consisting of 1333 acres, is located along the Saskatchewan River. The government of the university is in the hands of the chancellor and a senate of twelve members elected by convocation, which consists of registered graduates of British universities residing in the province and a number of *ex officio* members. The business affairs of the university are managed by a board of governors, partly elected by the senate and partly appointed by the governor-in-council. Courses in the college of arts

and science are open to students who have passed the junior matriculation or its equivalent. Students are admitted to the college of agriculture who have received a public school training and have done two years' work on a farm. The following degrees are conferred by the university: B.A., M.A., B.Sc., and M.Sc., B.Sc. Ag., B.Sc. Eng., B.Sc. Educ., LL.B., M.D., M.Ch., and D.D.S. The first commencement was held in 1912. The enrollment of students in 1911–1912 was 100, and the faculty consisted of twenty-two members.

SAVILE, SIR HENRY (1649–1622). — "The most learned Englishman in profane literature of the reign of Elizabeth," born near Halifax, England, and educated at and elected Fellow of Merton College, 1595. In 1578 he traveled abroad and collected manuscripts. He was tutor in Greek to Queen Elizabeth and in 1585 became Warden of Merton. In 1595 he was nominated as Secretary of the Latin tongue, but in 1599 he became Provost of Eton College and also continued to hold the Wardenship of Merton College. He was one of the translators of the Bible into English (1607–1611). At Eton, Savile, who was a strong administrator, reorganized the library. His greatest literary work, the most exacting in Greek scholarship achieved by an Englishman in Queen Elizabeth's reign, was the preparation of the magnificent edition of St. Chrysostom's (*q.v.*) works, for which he sent agents to almost every part of Europe to make collections of texts, and gathered round him at Eton some of the best English Greek scholars, *e.g.* Richard Montagu, Hales, Boys, Carleton, and Allen. Savile also wrote a translation with notes of four books of the *Histories of Tacitus*, 1591, and archaeological books on *Military Matters amongst the Romans*, first published in the *Tacitus* and afterwards separately in 1691. He wrote an account of the *Wages paid Ancient Roman Soldiers* (1596). In 1621 was issued *Prolectiones tresdecim in principum elementorum Euclidis*. Educationally, Savile's services to mathematics are no less marked than his erudition in Greek. He established in 1610 two lectureships, now professorships, at Oxford, each of £150 a year, in the subjects of geometry and astronomy, founded a mathematical library, and a mathematical chest, and gave £100 to provide apparatus. He delivered the first lectures in geometry himself in 1621. The professor of geometry was also to expound arithmetic of all kinds,

SAVINGS BANKS

speculative and practical; land surveying, canonics of music, and mechanics. The professor of astronomy similarly was to lecture on optics, gnomonics, geography, and the rules of navigation. But both professors were to be accessible for consultation by students, both to give attention to practical, or as we should say, laboratory methods, and both were made responsible for the equipment and safe-keeping of mathematical books, "instruments and tables and other furniture." Savile is thus for Greek literature and mathematical science the most outstanding figure of Queen Elizabeth's reign. T. W.

SAVINGS BANKS, SCHOOL—Though the school savings bank has been in existence for a long time, the plan has not as yet made the headway in this country which its importance deserves. In France, Belgium, England, Scotland, and parts of Germany, the school savings bank is a well-established and an important educational institution, while in Switzerland, Austria, and Italy, many such banks are found.

The first school savings bank seems to have been organized at Goslar, near the Harz Mountains, in 1820, and another at Apolda, in Thuringia, in 1833. Both of these are small German mining towns. The idea was introduced into France in 1834, and grew rapidly thereafter, though the great French development has been since the establishment of the third republic. Between 1874 and 1886, France established 24,000 school savings banks, with nearly half a million of deposits, and to-day the school savings bank is found generally throughout France. In 1866 the idea was introduced into Belgium, and still later into England, Switzerland, Italy, and other countries. In some of the German states and provinces, as for example, Saxony, Silesia, Posen, and the duchies of Meiningen and Brunswick, every little village and town is said to have its school savings bank. The school savings bank has also found a firm footing in Belgium.

In the United States, public attention was attracted to the idea in 1876, but the first practical introduction of the idea was not until 1885. In that year Mr. J. H. Thiry instituted a savings system, adapted from plans followed in Europe, into the public schools of Long Island City, New York, and began to interest school officials in the idea. Rutland, Vt., and Islip, L.I., began school savings banks in 1886, Amsterdam, N.Y., in 1887; Jamestown, N.Y., in 1888; and Pottstown, Pa.,

SAVINGS BANKS

Brooklyn, Olean, and Kingston, N.Y., in 1889. Eight cities in Pennsylvania, one in Massachusetts, one in New York, and one in Ohio were added in 1890, and each year since then has seen an addition to the number of cities adopting the idea. Pennsylvania, New Jersey, and Michigan have been prominent in the work, as have also, to a lesser degree, Massachusetts, Connecticut, and Maryland. On the other hand, little or nothing has as yet been done in establishing school savings banks in many of our states. Recently Porto Rico has done important work in organizing school banks, as has also the Philippines. On January 1, 1910, school savings banks existed in 108 cities in the United States. Deposits were collected at 7330 school houses or stations, and the depositors numbered 160,525. In the twenty-five years since the first bank was established in the United States, the total deposits have amounted to \$4,618,731.00, the withdrawals to \$3,803,637.47, leaving a balance in the banks of \$725,097.49.

Many different plans are followed in different places and countries, though in a way nearly all of these reduce themselves to two. The essential feature of each of these is that the classroom teacher in the different schools collects or receives such small sums as the pupils of her class wish to put into the school savings bank. Either the teachers give the pupil credit on a blank form provided for that purpose and deliver the money collected to a bank, directly or indirectly, or they give the pupils stamps in exchange for the money turned over to them, and these stamps can be taken to a bank and exchanged for a bank book and deposit, or for cash. The two plans may be illustrated by the practice of two Michigan cities. Adrian uses the Thiry, or deposit system. The children bring their money to the school every Monday morning and give it to their class teachers. Each pupil has his or her own bank book, which is in the form of a card folder. The teacher then makes out, on a blank form, a list of depositors and the amount deposited by each. This is placed with the money in a sealed envelope, and sent first to the Superintendent of Schools, and thence to the bank. Usually under the Thiry system the bank merely records the total amount, not opening individual accounts until a child has at least three dollars on deposit, but in Adrian accounts are opened regardless of amount. In some cities the bank sends a collector to each school, on deposit days, to receive the money. Deposits of one dollar and upward draw interest, compounded semiannually. To withdraw money requires the presence of the pupil and a parent, and the signature of a school officer. During the summer vacation the bank deals directly with the pupils.

Grand Rapids illustrates the stamp system. Stamps are furnished to the teachers by a city savings bank, and these the pupils purchase

SAXE-ALTENBURG

Each pupil becoming a depositor is given a folder, with space for fifty stamps to be pasted on. When the folder is filled the pupil may exchange it for cash at the bank, or deposit it and receive a bank book, showing a deposit of fifty cents. The same plan for withdrawal rules as under the other system.

Some object to both the deposit and the stamp systems, as consuming too much time, and a system involving a less expenditure of effort has been evolved by Superintendent Reiman, at Hudson, Mich., which has become known locally as the Reiman system. In this each child has a card, three by six inches in size, ruled for forty weeks. When the child brings money, the teacher enters the amount and the balance on the card. The money turned in by the class as a whole is put in an envelope and sent to the principal, the bank calling for it at his office once each week. The principal and the bank do not deal with individual accounts until a child has one dollar on his card. When this occurs this amount is subtracted from the balance and transferred to the bank account, and this happens as often as a dollar is deposited. Otherwise the system is much like the others. The advantages claimed for the Reiman system are the ease and economy in handling the accounts.

The fundamental idea underlying the plan is the encouragement of thrift among the children in the schools, and it has received the hearty cooperation of bankers generally. The business, as banking business, does not pay at all, but the influence in developing habits of thrift and economy is so valuable that banks are usually willing to do the business at a loss. Some banks have provided special low windows for pupils' use, and the experience of many cities has been that pupils frequently transfer their accounts from the school savings bank to the regular savings banks, and thus early begin to learn to look upon economy, thrift, and a savings bank account as desirable things to possess. E. P. C.

SAY, JEAN BAPTISTE (1767-1832).—French economist, journalist, and teacher. Napoleon appointed him on the Committee on Finance in 1790. His *Traité d'Economie politique* (1803) was the cause of his retirement from the state service, but he was later appointed professor of political economy at the Conservatoire des Arts et Métiers (1821), and professor of the same subject at the Collège de France (1830). His most important work of an educational character was *Objet, ou Essai sur les Moyens de réformer les Mœurs d'une Nation* (Paris, an VIII), decidedly Utopian in its general conception. While this is in no wise a treatise on education, he assumes an acquaintance with the principles of education "discussed and established by the great masters, at the head of whom among the modern writers one reckons Montaigne, Locke, and Rousseau." He also wrote *Cours complet d'Economie politique pratique* (6 vols. in 3, Paris, 1828-1829). F. E. F.

SCALIGER

SCALIGER, JOSEPH JUSTUS (1540-1609). — One of the foremost classical scholars of his age, born at Agen, near Bordeaux, where he attended the Collège de Guenne (1552-1555). After leaving school he acted as amanuensis to his father, Julius Cæsar Scaliger (1484-1559), himself no mean scholar, and acquired considerable faculty in Latin. After his father's death he attended the University of Paris for four years and studied Greek mainly and also Arabic and Hebrew. For a time he traveled widely with Louis de Chastaigner, a French nobleman with whose household he was connected for thirty years. In 1570 he studied law at Valence under Cujas. During his travels Scaliger had become a Protestant, and after the massacre of St Bartholomew's fled to Geneva, where he was appointed professor at the Academy, a position which he soon resigned, owing to his dislike for lecturing. In 1574 he was again in Paris, and his literary activity now began. He issued editions of classical works which were marked by sound textual criticism, based on a careful study of MSS., these included the *Catalccla* of Vergil (1575); *Pestus* (1575); *Catullus*, *Tibullus*, and *Propertius* (1577). In 1570 he edited *Manilius*, an ancient astronomer, and in 1583 published *De Emendatione Temporum*, a reconstruction of the hitherto accepted chronology, supplemented in 1606 by the *Thesaurus Temporum*, a collection of the chronological works in Greek and Latin, which included his edition and reconstruction of the *Chronicles* of Eusebius. Scaliger's reputation was established as the foremost scholar and textual and historical critic of his day. In 1593 he accepted a professorship at the University of Leyden which involved no lecturing. Scaliger's last years were embittered by the attacks

SCARLET FEVER

of the Jesuits, on whose behalf Scroppius wrote *Scaliger Hypobolimaus* (1607) to disprove Scaliger's claim, put forward in his *Epistola de Vetustate et Splendore Gentis Scaligeræ et J. C. Scaligeri Vita* (1594), to be descended from the La Scala family of Verona. Scaliger replied in the *Confutatio fabulae Burdonum*, which convinced only his friends.

SCARLET FEVER, OR SCARLATINA, is an infectious disease of very contagious character. The specific cause is not positively known. It is supposed by many to be a microbe morphologically similar to the streptococcus. The symptoms are sudden fever, vomiting, redness of the tonsils, sore throat, flushed skin, and from twelve to thirty-six hours after the first symptoms a fine scarlet rash, especially on the chest and neck, and at a later period peeling of the skin and frequently discharge from the nose or ears. The period of incubation varies from twelve hours to three weeks, but in most cases it is from four to seven days. The maximum morbidity and mortality occurs in the early years of life, most of the cases occurring before the age of fourteen. During the early years it is a very serious disease, and the more so because of serious complications and sequelæ that are liable to occur. The mortality is especially large before the age of six. The incidence of the disease according to age is well illustrated by the investigations made by Dr. Meder at Brunn for a period of fifteen years. The results are shown in the following table based on 5225 cases.

MORBIDITY AND MORTALITY FROM SCARLET FEVER ACCORDING TO AGE

YEARS	0-1	1-3	3-6	6-14	14-20	20-30	30-40	40-50	50-60	60-
Cases	123	005	1861	1801	230	00	20	7	3	—
Deaths	42	268	309	131	12	4	1	1	—	—

Scarlet fever is spread by contact with another person infected or a carrier of the germs of the disease; but contrary to popular opinion the peeling of the skin seems to have little to do with the infectivity, and the possibility of the disease being carried in clothing or the like is doubtful. Investigations in the London schools indicate that the disease may be spread in classrooms through personal contact with a previously known case, a mild, unrecognized case not excluded from school, or rarely a healthy carrier case. The chief sources of infection in the school are probably cases that have not been recognized, either those in the early stages or the so-called missed cases. The period of possible infection seems to be a

long one, from four to eight weeks or even more. There are very great individual differences in the susceptibility to scarlet fever. Certain individuals and families, and perhaps certain races, seem to be largely immune to the disease.

A much smaller number of cases is likely to occur during the vacation months of the summer (See CONTAGIOUS DISEASES.) This may be due to the season of the year more than to the fact that the school is a factor in spreading the disease. The London studies indicate that the school influence in the spread of the disease is usually small. Even where children return to school before the peeling of the skin is complete, secondary cases seldom occur.

SCARLET FEVER

It is customary to exclude children who have this disease from school for a period of from four to eight weeks, and in any case they should not be readmitted until after the sore throat and scaling of the skin have disappeared, and it is deemed necessary that other members of the family where a case occurs should also be excluded from the school.

In regard to school closure for scarlet fever opinion is divided, and the question should be decided in any case with regard to local conditions. In a community where there is no medical inspection it seems wise to close the school at the first indication of the presence of the disease, and parents should be notified to take special care of their children. In a community where there is competent health inspection, school nurses as well as school physicians, it seems to be unnecessary and unwise to close the school on account of the disease, but class closure may be desirable in kindergartens and primary grades.

Various serums for scarlet fever have been prepared, but at present there seems to be no specific remedy. Special care, report of cases, and isolation, however, have brought about conditions in Boston, at least, that have greatly reduced the mortality. This is shown by the statistics prepared by Dr. McCollom: the decrease in mortality per 10,000 has been from 2.88 during the period from 1880 to 1891, inclusive, to 1.83 during the period from 1895 to 1907, inclusive; and the decrease in morbidity from 33.07 during the period from 1880 to 1894, inclusive, to 25.35 during the period from 1895 to 1907, inclusive. The history of the last hundred years, suggests, however, that a period of greater mortality may recur.

The important points for the prevention and control of scarlet fever are first of all complete registration of all cases kept by the school authorities or the Board of Health, careful medical inspection to detect the disease in the early stages, exclusion from school of other members of the family as well as the sick child, the following up of cases by school nurses, and, withal, special care that mild cases do not pass undetected. SCHEDULE OF SCHOOL STUDIES — See SCHOOL MANAGEMENT

SCHELLING, FRIEDRICH WILHELM JOSEPH VON (1775-1854).—One of the greatest philosophical teachers of Germany, was a preeminent but inconsistent thinker and writer. At the age of fifteen he won the master's degree at the University of Tübingen, and at twenty had published two remarkable philosophical treatises which made him famous and got him the sobriquet of "the boy-Plato of Germany." At twenty-three he became professor of philosophy at Jena, and later on occupied the same chair at Würzburg, Erlangen, Munich, and Berlin, thus making the almost unparalleled record of fifty-six years as an university professor. He had the lively imagination of a poet, rather than the critical intellect of a philosopher. He was a great master of the art of eloquent disquisition, and his lectures (richly illustrated from the results of a wide range of reading and some scientific knowledge) fascinated his hearers, even when his tendency towards mysticism made them difficult of comprehension. The works upon which his fame depends were all published before he was thirty years old. They exerted an important influence upon the development of German philosophy, literature, and science. The most important were the *Philosophy of Nature* (1797), *System of Transcendental Idealism* (1800), and *Philosophy and Religion* (1804). His philosophical views were as varied as his university experience, as he was in swift succession a follower of Fichte, Spinoza, the Neo-Platonists, and the modern Mystics. His philosophy really consisted of two distinct systems, connected by a common principle: the first transcendental and ideal, in which thought precedes being, the second realistic, in which being precedes thought. He himself described the former as his "negative" and the latter as his "positive philosophy." He presented his conceptions of higher education while outlining in popular form his system of philosophy in his *Lectures on the Method of Academic Studies* (1802; *Werke* V). During his later years Schelling was overshadowed by Hegel, his most famous disciple. W. R.

SCHEM

SCHEM, ALEXANDER JACOB (1826-1881) — Joint author with Henry Kiddle (*q.v.*) of *Cyclopædia of Education*; was educated at the universities of Bonn and Tübingen in Germany. He was professor at Dickinson College (1854-1860) and assistant superintendent of the schools of New York City (1874-1881). W. S. M.

See *ENCYCLOPEDIAS OF EDUCATION*.

SCHILLER, FRIEDRICH (1750-1805). — The great German poet has had an influence upon the education of his nation, the extent and depth of which can scarcely be measured, and this influence has been altogether and in the highest degree wholesome. His love of freedom and the lofty idealism with which not only all of his works are permeated, but which are equally exemplified by his beautiful life, have made him a favorite of the people, especially of the young. No other German poet is as truly national as Schiller. It has long been recognized that his works are especially adapted for purposes of education, as much on account of their ethical character as on account of their great literary value. Thus it has come about that generations of German leaders and thinkers at the most impressionable periods of their lives had their characters influenced by the dominant ideas of Schiller's works, — moral freedom, the striving after a harmony between the sensual and the rational nature of man, and a high conception of the dignity of humanity.

Schiller's direct contributions to education are also very important. They are chiefly contained in his philosophical essays, particularly in the essays *On the Aesthetic Education of Man*, *On the Sublime*, and *On the Necessary Limits in the Use of Beautiful Forms*. In the *Letters on the Aesthetic Education of Man* Schiller deals with the two fundamental "impulses" of man, the sensual impulse, which keeps changing him in accordance with the laws of physical nature, and the formative impulse, which arises from his rational nature and tends to maintain his personality. The two are harmonized by the impulse of free play, in other words by creative art, in which matter and form are fused in a higher unity, namely, ideal beauty. Art, therefore, becomes the most important means of a truly humanizing education. F. M.

SCHLEGEL, AUGUST WILHELM VON (1767-1845) — German poet, Orientalist, and university professor. His essential educational services are threefold, viz. as a trans-

SCHLEIERMACHER

lator, as a critic, and as a student of Sanskrit. As a translator he made Shakespeare, Calderon, and Indian literature known to the Germans in their own tongue; as a descriptive critic he marked emphatically the distinction between classical literature with its strict observance of the unities and the new and fiercer romantic literature, and as a student of Sanskrit he early helped to develop the science of language. Schlegel was not great as an original poet, being a man not of genius but of distinguished talent.

The rich, varied, and restless life of Schlegel may be briefly sketched in relation to his work. Son of a Hanover pastor, he was educated in the Hanover gymnasium and in the University at Göttingen, where he studied philosophy and theology. After serving as a tutor in the home of an Amsterdam banker, he became at thirty a professor at Jena, where, for five years, he translated seventeen of the plays of Shakespeare with classical success, contributed to Schiller's periodicals, and, with his brother Friedrich, the deeper and more versatile thinker of the two, conducted the *Athenæum*, as an organ of critical opinion for the Romantic school, and formed the center of a circle during the years 1796-1800, including Fichte, Schelling, Tieck, and W. von Humboldt.

From Jena Schlegel went to Berlin, where during the years 1802-1805 he lectured on art and literature, wrote the tragedy *Ion* in ancient style, and translated five of Calderon's plays from the Spanish, as well as Spanish, Portuguese, and Italian lyrics. His lectures have been translated into many European languages, and the work *De l'Allemagne* of Mme de Staël, with whom he traveled through France, Switzerland, Germany, Italy, Spain, and Austria, shows the influence of his views.

The last period of Schlegel's life and work is marked by his removal to the University of Bonn in 1818, where he devoted his attention to Oriental studies, publishing his *Indische Bibliothek*, the *Bhagavad-Gita*, with Latin translation, and the *Ramajana*. The keynote of Schlegel's life, whether we think of his English, Spanish, and Indian translations, his devotion to medieval standards of work, or his separation soon after marriage from each of his two wives, is his romanticism.

SCHLEIERMACHER, FRIEDRICH DANIEL ERNST (1768-1834). — A distinguished German theologian, philosopher, pastor, and educator. As a theologian, he rejected both formal orthodoxy and rationalism in religion.

SCHLEIERMACHER

in favor of an emotional synthesis based on the mystical feeling of dependence. As a philosopher he reconstructed Spinoza and Kant independently from the Platonic standpoint. As a pastor he commended the Christian religion to all classes in Berlin through his broad sympathies and comprehensive insight. As an educator he assisted in founding the University of Berlin, and perhaps first of all struck the distinctly modern note in his writings on the social interpretation of education. On this point he deserves a careful monographic study in English. In all his theoretical and practical labors Schleiermacher was essentially a mediator between conflicting views, harmonizing them by deeper synthesis.

His life was one of tireless activity. Son of a Prussian army chaplain, he was sent as a youth by his orthodox father to two Moravian schools, where he welcomed the inspiration that came to his religious nature but rejected the theological teachings with which it was associated. He won a painful consent from his father to attend the University of Halle, where for three years he studied critical theology and Greek and Kantian philosophy. After serving as tutor for two years in a cultured and aristocratic household, he was for six years chaplain of the *Charité* Hospital in Berlin, reading widely at the same time and perfecting the outlines of his philosophical and religious systems. Without becoming a romanticist, he was profoundly affected for a time by Romanticism, the influence of which appears in his signal work, *Reden über die Religion*, 1799, new ed. 1879. In his ethical *Monologen*, 1800, he sketched his views of the individual and social relations in their future reconciliation.

In 1804 he began a three-year period of service at the University of Halle as professor and university preacher, winning both severe criticism for his "Spinozistic" views and great popularity, and beginning at the same time his life-long labor of translating Plato. In 1807 he moved to Berlin, where for twenty-four years he was to serve as pastor of Trinity Church, as professor in the new University of Berlin, and as secretary of the Academy of Sciences, showing himself, with Fichte, an inspiring patriot in those troublous days. Though preaching every Sunday, in his university lectures he covered in succession all the main theological and philosophical subjects, including pedagogy. Many of his numerous works exist to-day only as posthumous collections from his own and his students' notebooks.

SCHMIDT, KARL (1810-1861).—German educator, born at Ostermündburg, Anhalt, and educated at the gymnasium at Cothen. He studied theology at the universities of Halle and Berlin and in 1815 was appointed teacher at his old school in Cothen, where he remained, with a short interruption, until 1863. In that year he became country school inspector and principal of a normal school in Gotha and was responsible for a new school law. He was a student of anthropology and sought to enlist its results in the service of education. He wrote *Buch der Erziehung* (1851), *Anthropologie* (1863); *Gymnasialpädagogik* (1857); *Geschichte der Pädagogik* (1860-1862), and *Geschichte der Erziehung und des Unterrichts* (1860).

See HISTORY OF EDUCATION.

SCHOLARSHIPS.—England.—The early history of the English scholarship system has been treated under EXAMINATIONS. The present article is intended to describe the educational significance of the system as it exists to-day. Scholarships are maintained in order to enable boys and girls to obtain a more advanced form of education than their parents can afford to give them at their own expense. A scholarship may consist in free, or partially free, tuition in a school where fees are normally charged, or it may take the form of a money grant, which after paying the school fees leaves a margin for the holder's maintenance expenses. A system of scholarships, therefore, differs from a system of free secondary and higher education in that it gives assistance only to selected children; but on the other hand, the assistance given may be more adequate to the needs of the individual child than that afforded by free admission to a secondary school or university.

This complex social development has necessarily determined the organization of the English schools and universities. The elementary schools are open without fee to the children of all classes, but the type of education given in them is more particularly designed

for children of the wage-earning groups. The secondary schools and universities, on the other hand, are intended primarily to meet the needs of the various social groups above the unskilled labor class, and they, therefore, normally charge fees which vary according to the average income of the group with which the school or university is specially connected. Thus, for instance, among schools for boys, we have the great public boarding schools, charging £100 or more per annum, frequented by boys from wealthy homes and the sons of successful business or professional men, the large first grade day schools in the principal towns, with tuition fees of from £12 to £20, catering for what may be called roughly the middle and upper-middle classes, and, thirdly, municipal schools and cheaper grammar schools, with fees of from £3 to £10 a year, attended mainly by the children of shopkeepers, clerks, well-paid artisans, etc.

Such a system of schools represents on the whole the conservative aspect of English society. Under favorable conditions it meets the needs of the average members of the various social groups. But it tends to prevent able children of limited means from obtaining education superior to that of the normal members of their group. In particular it tends to *confine any form of secondary education* to children whose parents can afford to keep them at school until at least fifteen or sixteen years of age, paying the school fees and other necessary school expenses, while higher secondary and university education is made possible only for the few. Such a result would be calamitous from two points of view. In the first place, it would preclude many children from being trained for positions suited to their abilities, and in the second place it would prevent the skilled callings and higher social groups generally from obtaining an adequate number of well-qualified recruits. To obviate this difficulty scholarships are maintained both with the object of enabling comparatively poor but able children to obtain the educational opportunities necessary for the full development of their powers, and also with the object of recruiting the callings which demand an extended course of professional or technical preparation. The former class of scholarships is the educational correlative of the desire to increase the vertical mobility of society, the latter gives expression to the equally insistent desire to increase the efficiency of the community by raising the standard of professional and technical attainment.

In recent years both these desires have been stimulated in a marked degree. More parents have come to recognize the desirability of obtaining for their children an education which would fit them for rising in the social scale. In particular the growing economic, political, and social importance of the group repre-

sented by the skilled artisan has led the members of this group to demand wider educational opportunities for their children. Hence it was not surprising that when by the Act of 1902 the County Councils were constituted the local education authorities for their respective areas, these councils should have established an extended system of scholarships, by which children might be enabled to pass from the elementary to the secondary school and in some cases to the university. It was equally natural that the Liberal government should in 1907 have supplemented this system of scholarships by compelling all state-aided schools to admit a large number of elementary school children without charging them any fee. Here, therefore, we have one main branch of the existing system of scholarships, the branch which aims in the first instance at the provision of educational opportunities for individual boys and girls, though incidentally it helps to fill the secondary and technical schools and universities, and thus promotes the training of recruits for the higher industrial and professional callings.

In the second branch of the scholarship system this latter purpose is relatively more important. The higher standard of knowledge and technical skill now demanded in professional and industrial callings has rendered it imperative that opportunities should be afforded to actual or intending members of these callings to improve their educational equipment, and also that these callings should be recruited from a wider social area, for only in this way can an adequate supply of able members be obtained. Hence we find that the local education authorities establish scholarships to be held at technical institutions of various types and at all kinds of evening classes. And the same general motive has also led secondary schools, universities, and technical institutions to offer scholarships of their own. These latter scholarships aim in the first instance at attracting able boys or girls to the institutions by which the scholarships are offered, but in so far as this purpose is achieved an increase is effected in the number of persons educationally qualified for membership in the social groups with which the school or university is connected. Thus, for instance, the Oxford and Cambridge colleges offer a large number of entrance scholarships, awarding them to boys who appear likely to distinguish themselves in the university examinations. These scholarships really represent an effort on the part of the directive group to increase its own efficiency by offering appropriate training to able boys who would otherwise be excluded. Of the same general type are the entrance scholarships offered by the great public schools, which as a rule are gained by boys

¹ Normally 25 per cent of the total number of children admitted.

SCHOLARSHIPS

who have undergone a highly specialized course of training at a particular type of preparatory school, and also the leaving scholarships awarded by the public schools to boys passing from them to the older universities. Similar scholarships are offered by girls' schools and colleges for women, by middle-class secondary schools for boys, and by the local universities and technical institutions. It is clear that all the scholarships of this type tend to increase the opportunities of individual students, but a detailed study of the conditions of competition and the methods of award leads to the conclusion that the primary motive is the promotion of group efficiency.

It is impossible to state either the total number of scholarships awarded annually or the total expenditure involved, but the following figures will give some idea of the magnitude of the system as a whole. The total expenditure of the local education authorities in England, excluding Wales and Monmouthshire, upon aids to students in secondary schools, preparatory schools, and pupil teachers' centers during the last three years for which statistics are available was as follows: (*Statistics of Public Education in England and Wales*, Part II (C.D. 5508, p. 51)): 1906-1907, £340,583; 1907-1908, £372,047; 1908-1909, £435,237. To these figures must be added the amount granted by these authorities in aid of students in technical, art, and evening and similar schools and classes, viz.: 1906-1907, £78,074; 1907-1908, £85,531; 1908-1909, £91,705.

Since the introduction of the system of free places for elementary school children in state-aided secondary schools¹ the number of such children has consistently increased. The following are the figures for the last three years for which they are obtainable, (*Statistics of Public Education*, Part I (C.D. 4885), p. 137; (C.D. 5355), p. 116; and (C.D. 5843), p. 116), viz.: 1907-1908, 33,571; 1908-1909, 40,082; 1909-1910, 44,681. These children comprised roughly 30 per cent of the total number attending the schools. Some of them held County Council or other scholarships, but the large majority were "free places."

The number of scholarship holders other than ex-public elementary school children in these secondary schools was as follows: 1908-1909, 4241; 1909-1910, 3720. The expense to the schools of the education of these scholarship holders and "free places" cannot be accurately ascertained, but the cost in fees excused must have amounted to something like £200,000 per annum. Some part of this cost was met by grants from the Board of Education.

¹ These schools numbered in 1907-1908, 739; in 1908-1909, 807; in 1909-1910, 811 (C.D. 5483, p. 107). The majority of them are schools for the middle classes.

SCHOLARSHIPS

The value of the scholarships given by the public schools and other secondary schools not included in the government returns appears to be approximately £200,000 per annum. The entrance scholarships at the universities cost at least another £100,000, while the technical institutions and professional bodies maintain scholarships to the value of perhaps £20,000 per annum.

This would make the total annual expenditure upon scholarships amount to about £1,150,000, but, if we wish to ascertain the total cost of the education of the scholarship holders, a considerable further sum would have to be added, since in many cases fees paid on the scholarship holders' behalf do not represent the real cost of the education given to them.

The great variety of the scholarships awarded by the local education authorities is illustrated by the following list of scholarships offered for competition in 1911 by the London Education Committee, viz.: junior, intermediate, and senior county scholarships, trade scholarships for boys and girls, art scholarships and exhibitions, science and technology scholarships and exhibitions, scholarships for blind, deaf, or crippled boys and girls, exhibitions for apprentices in silver-smithing, typography, and lithography, cookery scholarships for domestic servants, junior domestic economy scholarships and dressmaking apprenticeships, and incipient marine scholarships. Besides these, they offered a variety of scholarships for intending teachers. (See *LONDON, EDUCATION* in.)

In the case of scholarships offered by local education authorities the competition is usually restricted to children living in the area controlled by the authority, and in some cases other conditions are imposed, with a view to excluding the candidature of children not in need of financial help. The entrance scholarships of the public schools and universities were until recently open to all candidates under a given age,¹ with the result that university scholarships have come to be coveted as distinctions awarded for intellectual merit rather than as pecuniary aids. There is, however, a growing feeling that, while the honor of winning a scholarship should be open to all, the financial benefit should be reserved for those who really need it.

Scholarships as a rule are awarded on the result of a written competitive examination. It was only the traditional belief in the fairness and efficiency of this test of intellectual ability that rendered it possible to deal with the candidature of large numbers of children who had in some cases passed through very different courses of previous training. Experience has, however, shown that this method of award, though cheap and convenient, has serious

¹ Nineteen years at Oxford and Cambridge.

SCHOLARSHIPS

defects, and efforts are being made in various quarters to supplement it by a consideration of the candidates' previous school records, by an oral examination, or by other means. (See EXAMINATIONS.)

The effects of this great system of scholarships are so varied and far reaching that it is impossible here to do more than mention a few of the most obvious results. There can be little doubt that scholarships have enabled a large number of promising children to obtain an education commensurate with their powers; in particular many such children have been given the opportunity of attending secondary schools. Scholarships have also proved an effective instrument for recruiting professional and technical callings. Incidentally they have brought elementary and secondary schools into close touch with each other, though they have not been so effective in bridging the gulf which divides English educational institutions into two great groups, the group represented by the elementary school, the lower-grade secondary schools, and the technical schools and colleges, and the other group represented by the public schools, their preparatory schools, and the older universities. In fact, the keen desire of the public schools to win scholarships at the universities has encouraged them to spend their strength upon highly specialized teaching in classics, mathematics, and pure science, and so to maintain their attitude of educational exclusiveness. Again it seems certain that much money has been wasted, partly by the award of scholarships to candidates who are comparatively well-to-do, partly by the encouragement given to children of moderate ability to prepare themselves for callings for which they are unsuited, many boys who would have become good artisans have been turned into second-rate clerks. This latter evil has been intensified by the methods of award, which have tended to give prominence to book learning at the expense of practical constructive work. It would also appear that in many cases secondary schools have suffered from being flooded with a larger number of free scholars than they could absorb into their corporate life.

Speaking generally, the English scholarship system has helped to tide over a period of educational reconstruction due to a rapid change of social conditions, but it has tended to absorb funds which might have been more usefully employed in improving the education given in the schools, and especially in raising the salaries of the teachers. It is probable that the next few years will witness further educational changes, and as a national system of schools and universities is evolved, the present scholarship system will probably be greatly modified, even if it continues to be a characteristic feature of English education. H. B. S.

United States.—Since both elementary and secondary schools are free throughout

SCHOLASTICISM

the states and have been in most regions for two or three generations, scholarships are only of importance in connection with higher education. The scholarship system is a direct descendant of the early practice of waiving or reducing the tuition fee in the case of needy students. Indeed, in many colleges and in some universities this is still the method. The more carefully organized institutions, however, have realized that this informal arrangement renders it impossible for the institution to keep its books intelligently, and it has therefore become the custom to collect fees from all students, but to set aside in the budget a specified amount for scholarship aid. At Columbia this amount varies from year to year, being, for each faculty, 10 per cent of the fees collected in the previous year. There are usually two types of collegiate scholarships, one awarded as the result of formal competition, usually the relative standing in entrance examinations, and the other in which the student's need and his "promise of future usefulness" are both taken into account. In the past there have been accusations that scholarships of the latter type have been used to attract students whose athletic prowess was more striking than their intellectual ability, but with the general improvement in the athletic situation within the last few years, less has been heard of these charges.

A recent development is the cooperation of the alumni of an institution who live in any given district in maintaining a scholar from that district at their *alma mater*. The Harvard and Yale clubs of San Francisco, for example, maintain scholarships for California students at Cambridge and New Haven. An interesting type of scholarship is that maintained and at his death endowed by Joseph Pulitzer, giving a stipend of \$250 to forty undergraduate students each year. In recognition of a separate gift to Columbia University, that institution provides in addition free tuition for these scholars.

Some type of scholarship provision is maintained in most of the endowed preparatory schools, and in the more fashionable schools, like Groton and Hotchkiss, these scholarships are deliberately used to prevent the danger of exclusiveness in the student body.

There is no real distinction between graduate scholarships and those in the professional and undergraduate departments, except that the former are ordinarily announced as public academic honors and are usually held for but a single year, whereas the latter are more likely to be confidential and to continue throughout the course. The stipend in either case seldom covers more than the tuition charges; and there is no restriction as to outside employment.

F. P. K.

SCHOLASTICISM AND THE SCHOOL-MEN.—Scholasticism as a system of phi-

osophy and theology was an effort to express in clear and definite form what was present in the consciousness of medieval Latin Europe. It dealt with the divine as well as the human, with the theological and ecclesiastical matters as well as with questions of philosophy and natural science. At the same time it did not fail to distinguish between these two orders of truth, one of which it called revelation and the other, reason. While it was of the essence of scholasticism to maintain the agreement of the two, it was equally essential to hold that there is a distinction between them. Mysticism (*q.v.*), which exaggerated the importance of the divine element in our experience, and rationalism, which laid undue emphasis on the human element, both contributed to the final form of scholasticism. And in that final form both were combined in such a way as neither to minimize the value of divine authority nor to deny to human reason its legitimate rights. It is necessary to call attention to this trait of scholasticism because the modern critic too often overlooks it, although it seems to be so strikingly evident. Either he accuses scholasticism of undue subservience to authority or represents it as an ambitious attempt to rationalize all religious as well as purely scientific truth.

The presence of the divine element in scholasticism was determined by the traditional doctrine of preceding centuries (the Patristic age), the contents of the Scriptures, and the official decrees of the church. These were accepted as matters of belief, then, as always, by all devoted members of the Catholic church. What was peculiar to the scholastics was their refusal to maintain these tenets as matters of belief, merely, and their consequent effort to render them reasonable by demonstration, or analogy, or at least, in a negative way, by answering the difficulties and objections of unbelievers. The human element in scholasticism was supplied by the experience of the scholastics themselves, but to a larger extent by the literature handed down to them, and most of all by the works of Aristotle, as soon as those works became known in Western Europe. The scholastics were curious about nature, but not critical. They excelled in the ability to grasp the meaning of principles, but in their estimation of facts they were too often credulous and readily believed on the authority of others when they should have been more inclined to investigate on their own account.

These factors determined the scholastic method of teaching and explain both the shortcomings and the peculiar excellence of that method. The scholastics were called upon to arrange, interpret, and expound the heritage of the preceding centuries, both in theology and in philosophy. Besides, they felt called upon to show the harmony existing between these two kinds of knowledge. For this

reason, they laid emphasis on dialectic, they adopted the Aristotelian logic and applied it to the task before them. Thus they brought to a high degree of perfection the art of formal definition and deductive argument; they excelled in the interpretation and exposition of texts; they attained an extraordinary skill in the use of words and in subtlety of distinction. With these advantages, however, went the natural defects of those qualities, the neglect of observation and original research, the depreciation of scientific experiment and of historical investigation. Not that the schoolmen condemned the study of nature or lacked a sympathetic interest in natural phenomena. It was their misfortune that they were too much taken up with the elucidation of their predecessors to afford time for the direct ascertainment of facts. There are, indeed, notable exceptions to this statement. Albert the Great and Roger Bacon showed what could be done by the use of the inductive method. They, however, were exceptions to the general spirit of the age, which was one of interpretation, elucidation, and deductive demonstration, and not of personal research.

The scarcity of books in medieval times contributed in a lesser way to influence scholastic method. It necessitated the reading of texts by the teacher and the dictation of his explanation, or commentary. In law, medicine, physics, and politics, as well as in theology and philosophy, the starting point in the lesson was a portion of some text. The words of the text were explained, the "sentence" or opinion contained in the text was compared with other "sentences," or opinions; proofs or analogies were furnished, examples or applications were given, and objections, difficulties, or reasons to the contrary were recited, explained, and refuted. There were many divergencies of method in matters of detail. Essentially, however, this was the line generally followed in all branches of education in the scholastic era. To the use of this method are due, as has been said, the manifest shortcomings of scholastic education; but to the use of it are due also the undeniable advantages of scholastic training. There can be no question of the suitability of this method to the needs of the age which employed it. It taught the medieval scholar to think; it taught him to distinguish very carefully the meanings of technical words; it taught him to systematize his knowledge; it taught him to demand the harmonious adjustment of knowledge and to fit into his scheme of the universe both the natural truth which he learned from Aristotle and the other ancients and the supernatural truth which he accepted on the authority of God and of the church. The best results of this method are seen in the mental development of Dante and in the many excellent qualities of mind which the humanists inherited from the scholastic era. It is

generally acknowledged that whatever precision the languages of Western Europe possess they owe to scholastic habits of thought. It should be just as generally admitted that not only the humanists but many of the scientific discoverers who inaugurated the modern era owed much of their vigor and freshness of thought to the scholastic training which they received. Though they realized the defects of the scholastic method and condemned them, they were indebted to that method far more than they were willing to acknowledge.

W. T.

The Schoolmen were the most noted of the scholastic teachers and writers but the term includes more specifically all the great teachers from Scotus Eriugena (ninth century) and Peter the Lombard in the twelfth century to William of Occam in the fourteenth. The definite setting of the conflict between Nominalism and Realism (*q.v.*) in the eleventh century, between Anselm (1034-1107) and Roscelinus (d. 1106), was the beginning of the great group of schoolmen. They were followed by Abélard (1020-1142), and he by a great group, among the most prominent of which were the following. Alexander of Hales (d. 1245) was the first to be acquainted with the entire philosophy of Aristotle and to employ it in the review of theology embodied in his great work, *Summa Theologiae*. Vincent of Beauvais (d. 1264) was an encyclopedist. Bonaventura (1221-1274), *The Seraphic Doctor*, a Platonist rather than an Aristotelian in his philosophy, represented as did the Victorines of the preceding century the mystical tendency in thought and education. Albertus Magnus (1193-1280), called *The Universal Doctor*, was the first to reproduce the philosophy of Aristotle in systematic form and with constant reference to the Arabic commentaries that constituted so large a part of the new knowledge of the times. Thomas Aquinas (1225-1274), *The Angelic Doctor*, was the most influential of all. In his great work (pp. 208-290), he represents the culmination of scholasticism and is its authoritative exponent, both in that period and in subsequent times. Joannes Duns Scotus (c. 1271-1308), *The Subtle Doctor*, was famous as a founder of a school of theology rivaling that of Thomas, his work, however, was rather of a critical and negative than of a constructive character. The long line of great schoolmen was closed by William of Occam (1280-1347), *The Inevitable Doctor*, who revived again the nominalist views.

For the specific works and influence of all of these, see the separate biographical articles under the proper captions in this work.

SCHOLASTICUS. — The official representative of the church in educational matters in the Middle Ages. Other titles borne by him were *Magister Scholarum*, *Archischola*, or *Ecolâtre*. Originally the *Scholasticus* himself taught, but as his duties became more and more multifarious, he devolved this duty on a schoolmaster.

See BISHOPS' SCHOOLS; CATHEDRAL SCHOOLS, CHANCELLOR'S SCHOOLS; CHURCH SCHOOLS, TEACHERS, LICENSING OF; MONASTICISM AND EDUCATION.

SCHOOL. — There is perhaps no more remarkable instance in the history of language of the perversion or conversion of terms to express the very opposite of what they originally meant than that of the word school. Originally denoting leisure, spare time spent in rest and recreation, it has come to be the technical and common word for that scene of continuous activity and strenuous business, the place of education of boys and girls. It is strange, too, that though the word school, like the thing, descends to us straight from the Greeks of the classical time, the Attic Hellenes, it was never used by the Greeks themselves to mean that thing. Among them *scholè* meant no more than rest, and to have *scholè* was to take things easily. A school in Hellas was called *didaskaleion*, a teaching place. It was not till the Alexandrian age that it was distinguished as a *grammateion*, a *mousetion*, or a *palastra* or *gymnasium*, according as it was a grammar school, a music school, or a school of physical training. In point of fact there was no regular word for a music school and, *mousetion*, meaning a temple of the muses, is only used by way of metaphor. The idea of *scholè*, leisure, in connection with education is due to the fact that in Greco schools began at the top. The first organized teaching establishments were those of what we should call the university order of education. The discussion forums or talking shops which sprang up in the suburban gymnasia (*g.v.*), where the gilded youth of Athens spent their leisure time in sports and exercises in training for

war, gradually crystallized into schools of philosophy and the higher arts. Then origin is described by Milton with his usual felicity when he asks Melancholy to bring with her "retired Leisure That in trim gardens takes his pleasure." In the leisure spent in the trim gardens of the Academy, schools developed. Appropriately enough, Plato is said to have been the first person to use the word *scholè* in anything approaching an educational sense. In a passage in *Laws* (c. 320 B.C.) he speaks of certain mathematical matters as fit for the leisure of old men, and for contention in disputations (*scholais*) fit for them, but it is by no means clear that the true translation is not "in pastimes suitable to them." A passage in Aristotle's *Politics* (IV, i) in which he dismisses the question of the identity in the causes of prosperity of the state and the individual with the remark that it is "a matter for another discussion" (*scholais*), appears to show that the word was already beginning to be appropriated to the method used in philosophical leisure. The first undoubted use of the word in Greek in the sense of school seems to be in Dionysius Halicarnassus, c. 30 B.C., when, in the latter to Ammaeus (I, vii, ad fin.), he speaks of Aristotle as having been till the age of thirty-three with Plato and neither the leader of a school (*scholè hegemónos*) nor having established any philosophy of his own. Here it is a school of thought that is spoken of, not a school as a place of education. Plautus, however, c. 213 B.C., uses the Latin word *ludus*, which properly means sport or pastime, in his plays, which are often translations or adaptations of Greek plays, as a translation of *scholè* in our sense of a school. So it would appear that the word was already in current use, if it did not appear in literature. Plautus talks of "going to school," the grammar school, *ludum litterarum*, to which the old gentleman in the *Mercurator* began to go and had already, on his first day, learnt to spell a three-letter word, *amo*, I love, while in the *Rudens* a young man falls in love with a girl whom he sees going to the lyric school (*ludum fcheinum*).

Though *ludus* is used freely in the classical Latin authors for school, *schola* is almost equally common. From the fact that in medieval times the word *ludus* was practically unknown, or at least very seldom used, and that *ludimagister*, the word used by Cicero and Martial for schoolmaster, also went out of use, while *schola* and *scholarum magister* are universal, it would appear that at Rome and in the Roman lands, in current talk, the Greek word *schola* and not its Latin translation was commonly used. This is borne out by the fact that the gilds, mainly of the artisans and the common people, the religious gilds, burial clubs, and the like, dedicated to various gods and goddesses, were commonly called, not by the ancient Roman and aristocratic name of *Collegium* (q.v.) but by the Greek word *schola*,

and the Code recognized the schools of the scribes, (*schola chartulariorum*, not the equivalent of *Ecole des chartes*), of the butchers, shoemakers, and so on. Then buildings too were called *schola* (see Baldwin Brown's *From Schola to Cathedral*). The Jews used the same word for their synagogues. Quintilian, A.D. 90, used the word *schola* exclusively in his celebrated discussion as to whether boys should be brought up at home or in schools, and Jerome, c. 300, speaks of Quintilian as being the first to teach a public school. Owing partly to the fact that the early councils of the church were held in the Western Empire and conducted in the Greek tongue, the word *schola* became the practically exclusive word for school. When translated into Latin in Italy school appears rather as *studium*, as in Pope Eugenius II's edict in 820, then as *ludus*. Wherever schools are mentioned in the early canons the word *schola* is used. Schools were apparently unknown to Western and Northern Europe before the coming of Christianity. At all events in all the Teutonic, as in the Romance, languages the word for school is some variant of *schola*. The Irish Saints' Lives, if any of them can be accepted as really representing writings before the Christianization of England, invariably used the word school. The earliest authentic Western writer who mentions the thing, Bede, writing in 735, and speaking of the year 631 and of Sigbert, King of the East English, says that he instituted a school, *scholam*. In the form *scola* without the *h* the word invariably appears in English, French, German, and Italian writers up to the Renaissance. Why the *h* disappeared in the mouth of the English Bede it is hard to understand, the fact that would call white "hwit" could have had no difficulty with the aspirate. But presumably it had disappeared in the mouth of the Galloway Celts before. The only early passage in which the word *ludus* is used is in that vitely affected writer the pseudo-Asser, who in the *Life of Alfred* speaks of his sending his younger son to the grammar school in the phrase, *ludis litterarie discipline*, and he goes on to speak of that school, in *qua scola*. Aelfric in his *Collaqui*, being perhaps also anxious to show off, translated "learning" into *gymnasium*, a subsequent Renaissance affectation permanently adopted by the newly-learned Germans at the Reformation. But in his grammar Aelfric talks naturally of the School of Ethelwold (*Scola Aethelwoldi*) at Winchester.

The use of the word *ludus* in the plural by pseudo-Asser for apparently a single school is the first instance of that which became the common usage from about the year 1100 to the year 1510. Throughout that time the plural *scolæ*, *scolas*, was used for "a school" or "the school," especially in formal or official documents. One of the earliest instances is in the foundation of Eze Priory between 1070

and 1083, when Robert Malet granted to the priory "the church of Eye and all the churches in the neighbouring town of Dunwich and the school (*scolas*) of the same town." Another early instance is in 1114, when Bishop Herbert of Lozinga of Norwich took back from the monks, who had been placed in the ex-cathedral of Thetford, the governorship of the school and restored to Dean Bund and the secular clergy, "his school, *scolas suas*, at Thetford as he had most fully held it" and forbade any other school there. So too in the grant about the year 1111 to St. Paul's School, the bishop of London confirms to Hugh, schoolmaster (*Magistro scolorum*) and his successors *ex officio* (*ex magistratu dignitate*) a house or school-house by the Bell Tower, and to him also *ex officio* (*scholarumque privilegio*) the privilege or liberty of the school, the librarianship or custody of the books of the church. This is perhaps the earliest use in England, at all events, of the term *Magister scolorum* for the master of a single school. It is one of the most conspicuous examples of the misunderstanding of the whole history of schools, which has arisen from not recognizing that the plural is used for the singular. Bishop Stubbs misinterpreted this document in consequence into the founding of St. Paul's Schools, and the supposition that there were more schools than one, apparently a song school as well as a grammar school, under this master, and the consequent implication that the medieval schools generally were mainly choristers' schools. Fortunately the statutes of St. Paul's themselves carry the refutation of the mistake with them. For while the original writ of Henry of Blois, Bishop of Winchester, acting Bishop of London from 1138 to 1140, directs the chapter and the archdeacon of London to pronounce sentence of anathema against any one lecturing in London without the licence of Henry, schoolmaster (*Magister scolorum*), except those who keep the schools of St. Mary-le-Bow and St. Martin-le-Grand, the statutes written in 1250 explain that under the Chancellor (to which title that of schoolmaster had been changed in 1205) are all the scholars living in the city except the scholars of a school of St. Mary-le-Bow (*unius scola de Arcubus*) and a school (*unus scola*) in the Basilica of St. Martin-le-Grand. An appointment to the mastership of this single school at St. Mary-le-Bow in 1390 is preserved in the Archbishop's register at Lambeth, and it is talked of throughout in the plural. The master is *rector scolorum grammaticarum*, the keeping the school is called *regimen scolorum*, and the appointment is said to be *presecio magistris in eisdem, not in eadem*. So in 1446 Henry VI speaks of the one grammar school founded in the "Roiall College," of Eton as a public general grammar school (*publicas generales scolas*) and gives the same school (*eadem scola*) a monopoly in Windsor

and for ten miles round Eton. The use of the word school in the singular did not wholly disappear, as we find for instance in the Bunsar's Rolls, the accounts of Winchester College, the schoolmaster called sometimes *Magister scolorum*, sometimes *Magister scola*. But until about 1480 the use of the plural especially in formal documents is almost exclusive. What the origin of the use of schools in the plural instead of the singular may be it is difficult to say. It is possible that it was due to a little knowledge of Greek proving a dangerous thing and the Greek singular *scholê* being mistaken for the Latin plural written at that time not *scholæ* but *scholæ*. The usage certainly disappeared at the time when a knowledge of Greek again became common. But on the whole it seems from the date when the usage became common that it was due to the rising universities of Bologna and Paris, where there were more schools than one, and the teaching masters, the *magistri legentes* or *regentes*, were not confined to teaching one school, but were generally "masters of the schools" which constituted the *studium generale*. As the university set the fashion, the master of the cathedral and other grammar schools followed suit, and called themselves (as they generally were university regent masters in arts), *Magistri Scolorum*, and the one school of which they were masters, being the *scolarium* in question, by parity of reasoning, became dignified also with the plural. The usage died out when English began to supersede Latin. We find, for instance, ex-Lord Mayor Percyvall founding "a Fre Gramer Schole," at Macclesfield, in 1603 by a deed in English and naturally using the singular. Perhaps Colet's deeds in Latin in 1610 relating to the transfer of the old school (*antiqua scola*) of St. Paul's and its rights, and their merger in the "*novæ scolæ*" he was founding, are the first formal documents emanating from high ecclesiastical authority in which the singular is used. A little later the introduction of Plautus as one of the commonest books to be read in schools, and the spread of Greek, introduced the use of the Latin *ludimagister* and the Greek *archidascalus* for schoolmaster, and the word *ludus* for *scola* in Latin documents. But the latter word was too deeply rooted to be driven out. The retention of *scola* in the legal formula adopted in Henry VIII's and Edward VI's refoundations of the old schools as *libera scola grammaticalis* or free grammar school, settled the usage. Grammar school or free school remained the common as well as the technical term for a school in England, which was thus spared the gymnasia of Germany, the *academies* of Scotland, and the *lycées* of France. Since the eighteenth century the prefix of grammar or free has been dropped, and the word school *simpliciter* with the territorial addition of the name of the place, as

SCHOOL AGE

Westminster School, Ipswich School, reigns as it did in the twelfth century. A. F. L.

SCHOOL AGE — See ATTENDANCE, COM-PULSORY, BACKWARD PUPILS, CENSUS, SCHOOL; CHILD LABOR; GRADING AND PROMOTION; RETARDATION, etc

SCHOOL AND COMMUNITY — See SCHOOL AS A SOCIAL CENTER.

SCHOOL AND LIFE. — See COURSE OF STUDY, THEORY OF; EDUCATION; VALUES; SCHOOL AS A SOCIAL CENTER.

SCHOOL AS A SOCIAL CENTER. — According to common usage this title refers specifically to an institution recently established in a number of American cities which provides within the school premises but outside of the day class hours, various social, recreational, and cultural opportunities for the people of the neighborhood. In a larger sense, it denominates an educational viewpoint whose definition may be due to sociology, but whose present currency has largely resulted from the increased burdens which society, impelled by vast changes in living and industrial conditions, has laid upon modern school systems. Viewed from this standpoint, the public school presents two fairly distinct aspects: (1) as the agency for preparing the immature for efficient membership in society, and (2) as the operative or administrative center for various services of immediate benefit to the community as a whole. In general, the former corresponds to the day school proper and the latter to all the other activities not connected with the day instruction that take place on the school premises, among them being the "social center" to which reference has been made. Actually there is not a strict coincidence between the two functions and these two sets of activities, but the latter are so distinct administratively and so separate in public thought that clearness is gained by dividing the discussion upon this basis.

(1) Under the influence of the ideal of an "education related to life" which has been especially effective during the past few decades the social efficiency of the public school system has, in the more progressive communities, been vastly increased.

Through an enrichment of the content of instruction and a closer adaptation of it to the specific needs of the individual, the modern school is giving a more adequate preparation for the responsibilities and opportunities which are encountered in a highly specialized civilization.

An unconscious preparation for the life of the outside world is given to the pupil merely through his living, during school hours, in a

SCHOOL AS A SOCIAL CENTER

miniature community. In the process of making place and providing suitable equipment for all its new activities the school plant has grown greatly in size and the school life has become wondrously diversified. With its shops, kitchens, lunch rooms, sewing rooms, laboratories, museums, libraries, stores, banks, offices, newspaper plants, assembly rooms, gymnasiums, armories, swimming pools, playgrounds, and gardens, the modern school has become a more complete microcosm of society than is found in any other single institution.

Certain features of the public school regimen have important effects upon the adult portion of the community as well as upon the children. Medical school inspection not only reduces the amount of communicable disease among the pupils, but prevents its spread generally. The attitude toward the care of the body which is incidentally imparted by the frequent examinations of the eyes, ears, teeth, throat, skin, and weight, is carried by the pupil to his family along with other hygienic facts taught in his classes. The school nurse in her visits to the homes is constantly spreading health information and lifting the standards of domestic sanitation. On account of the school's influence and machinery, health officials, anti-tuberculosis societies, and similar organizations often seek its aid in waging special campaigns, and eminent authorities have proposed its use as a permanent local health office. Other municipal officials have obtained the school's cooperation in organizing street-cleaning squads among the boys, and the problems of street beautification have also been attacked through the same agency. The tendency to prosecute reforms of various sorts through the school is further illustrated by the effort to secure fire prevention pledges from pupils and by the frequent proposals to set aside certain days for exercises in behalf of some cause. Peace Day, Mothers' Day, Clean-up Day, Health Day, Bird Day, and Conservation Day are some of the occasions which have been urged as entitled to the same observance that is accorded to Arbor Day.

The expansion of the school plant is partly the result and partly the cause of an extension of its usefulness in several other ways. The establishment of kindergarten activities not only brought a younger group of children within the range of public education, but it added to the school building a room which was suitable for many recreational and social occasions that were impracticable in a classroom. When the mothers' clubs which first met in the kindergartens grew into large parent-teacher associations the need of an assembly room was so emphasized that it now forms a part of most new elementary buildings. The amount of the school's service to young people in general has been increased by the establishment of vacation schools (*q v*), and organized play (see *ATTRACTIONS*) in schoolyards, and even-

SCHOOL AS A SOCIAL CENTER

ing recreation centers. Through the evening schools (*q.v.*), with their English for foreigners and further education for natives, through the public lectures, social centers, and the meeting of various organizations in class and assembly rooms, school facilities have not only received an augmented social effectiveness, but their benefits have been extended to a class of older people.

(2) *The location of the school building in the center of a neighborhood and its close contact with the families of the district make it a natural point of distribution and administration for a number of community activities.* In a half dozen or more cities the polling of votes takes place in schoolhouses and in others they are opened for the public discussion of proposed constitutional amendments and similar matters pertaining to direct legislation, while in rare instances they are used for the holding of political caucuses. Partisan political rallies have been permitted in some of the school edifices of New York, Chicago, Jersey City, and one or two other cities. In a growing number of places branches of the public library, open to the neighborhood during and after class hours, are maintained in school buildings. Museums are also beginning to find a place in the schoolhouse, while in the high school at Richmond, Ind., there is an art gallery for which the municipality makes an annual appropriation of \$1000 with which to purchase new pictures. A yearly exhibition of paintings is held, to which many well-known artists send their work. Professor Commons has recently outlined the plan of a national employment bureau the branches of which would be located in the schoolhouses. Here the laborer would register his need of work and here, a few days later, he would receive information about the places where his services were in demand. The high school at Coldwater, Mich., has a "work bureau" for boys who want to do odd jobs after school hours and on Saturdays, while many of the technical and commercial schools make systematic efforts to find suitable positions for their graduates.

The community services so far enumerated in this section are sporadic, and not yet fixed in form or scope. They are beginnings rather than mature developments. The school social center, however, is an institution which has attained considerable definiteness and the dignity of a separate staff to conduct its activities. In the course of its development three fairly distinct phases have appeared. These are represented by the "educational center," "evening recreation center," and "social center."

Educational Centers.—These were first opened in the spring of 1902 in two public schools of Boston, three more being established the following winter. They afforded young people and adults of both sexes evening instruction in a dozen or more branches mainly

SCHOOL AS A SOCIAL CENTER

of a practical nature. There were classes in dressmaking, millinery, embroidery, and cooking for the women, and classes in carpentry, steam engineering, mechanical drawing, and civil service subjects for the men, while instruction in bookkeeping and stenography was furnished to both groups. There were also cultural courses devoted to such subjects as the American poets, civil government, and geology. A reading room equipped by the Boston Public Library was thrown open for general use, while the school hall was occupied by a large chorus and the gymnasium was the scene of a systematic physical training. The only provision for day pupils was a study room, which was enjoyed by members of the seventh and eighth grades. So far as practicable, the instruction was given in the form of "study lectures" and the atmosphere of informality made possible a considerable amount of conversation and the formation of new acquaintanceships. The pupils were divided into two sets, one attending on Tuesday and Thursday evenings and the other on Mondays, Wednesdays, and Fridays. The third season 132 teachers were employed in the five centers and the number of pupils registered was 8948. The centers were discontinued after the season of 1905-1906, but they had existed long enough to demonstrate the popularity of industrial and commercial education and to hasten its incorporation in Boston's public school system.

Evening Recreation Centers.—These have attained their highest development in the public schools of New York City where they were first established in August, 1899. The privileges afforded by each center consist of a gymnasium, a reading and quiet-games room, meeting places for clubs, and the direction needed for the intelligent utilization of each. At many of the centers swimming pools and baths are also available. Only those over the age of fourteen are admitted to the recreation center proper, though day pupils from the fifth grade up, who come with books and a card signed by their principal, are allowed to use a special room which is set aside for study and is under the supervision of a competent teacher. While the privileges are public, participation in the basket ball games and the organized athletics is restricted to the members of the clubs which meet at the center. These groups are recruited in the reading room and the quarters devoted to free play and quiet games, and the form their efforts shall take, whether literary, athletic, social, or civic, is left to their own decision. Twenty out of the fifty-four centers maintained in Greater New York at the present time (season of 1912-1913) are for the exclusive use of women and girls. In their athletic activities folk dancing has a prominent place, but they also play basket ball and, in general, enjoy the same privileges as the boys. Clubs whose members are sixteen years or over in age are known as senior clubs,

SCHOOL AS A SOCIAL CENTER

and in several of the girls' centers the senior clubs are allowed to hold weekly dancing classes to which properly accredited boys from the neighboring centers are invited. These parties are under the supervision of the center staff and, with the exception of a small fee (generally five cents) paid by the guests for the services of a violinist to supplement the regular pianist, are free to the participants. The senior clubs of both classes of centers hold entertainments, debates, and athletic contests to which the public is admitted, but these are the only occasions on which both sexes come together. The centers are open from 7:30 o'clock to 10 every evening except Sundays and holidays throughout their season, which opens in October and lasts through April, and in a few centers to June. The average nightly attendance, which was 9545 in 1907, had increased to 20,085 in 1911.

The administration of the centers is in the hands of a specially trained corps selected from civil service lists and directed by a district superintendent of schools assigned to this particular task. Next to this official stand the inspectors, who begin with a salary of \$1500, which in six years is automatically raised to \$1750. The other grades with the respective salaries are as follows:—

RECREATION CENTER SALARIES

Principals	\$4 00 per session
Teachers	2 50 per session
Assistant Teachers	1 75 per session
Junior Assistants	1 00 per session
Teachers of Swimming	2 00 per session
Librarians	2 50 per session
Pinnets	2 00 per session

The maintenance of fifty-one centers in 1911 cost \$84,500.91, which on the basis of the average nightly attendance made a per capita expense of \$1.20.

Social Centers—The third phase of the development thus far attained by the social center is best illustrated by the undertaking which was started in Rochester, N.Y., during the fall of 1907. To avoid any grounds for the suspicion of either philanthropic or aristocratic motives, the school selected for the first center was located in an obviously middle-class neighborhood. The assembly hall was equipped with gymnasium apparatus, the kindergarten was made available as a reading and quiet-games room, shower baths were installed and five hundred books were borrowed for library purposes. These privileges were opened to the women and girls on two nights of the week, to the men and boys three nights, while the remaining evening was devoted to a general entertainment in the auditorium, to which all classes were admitted. At the same time groups of men, women, and young people were organized as "civic" clubs. The men's club was open to all the adult males of the neighborhood and its weekly meetings in one of the larger classrooms were devoted to the

SCHOOL AS A SOCIAL CENTER

discussion of both local and municipal questions, the main addresses being made by prominent persons from the outside. The topics considered by the women's club embraced both public and domestic problems, and besides their regular meetings they frequently entertained the men's club. On these occasions the women decorated the rooms, provided a program, and served refreshments, while the men footed the bills. Both organizations were also influential in securing playgrounds, free dental clinics, and similar community improvements. The "coming civic clubs" composed of young people from fourteen to twenty-one were supervised by members of the social center staff. Both the boys' and the girls' clubs held weekly meetings when business was transacted, debates were held or addresses by outsiders were delivered. The larger part of their efforts, however, were engaged by basket ball, calisthenics, amateur theatricals, and social affairs. Membership in all four organizations was open to all persons without distinction as to creed or political affiliations, and while it conferred the privilege of class instruction in the gymnasium, it was not requisite for the enjoyment of the library and games room. In the management of the weekly "general evenings" the men's and the women's club alternated and parts of the entertainment were frequently contributed by the younger organizations. The usual program consisted of congregational singing accompanied by the center orchestra, with an illustrated address, readings by an elocutionist, or a musical entertainment as the main and, usually, paid, feature. Social dancing, an athletic exhibition, or a period of conversational sociability brought the evening's enjoyment to a close. The staff at the first center and their salaries were as follows:

POSITION	YEARS PER WEEK	SALARY
Director	0 ¹	\$15
Director of women's and girls' clubs	3	25
Director of boys' clubs	3	25
Librarian and in charge of games room	6 ¹	30
Director of men's "gym" work	1	25
Director of women's "gym" work	2	25
Pianist for women's "gym" work	2	15
Door and hall-keeper	6 ¹	20
Night janitor	6 ¹	60

¹ Sunday afternoon also.

The following year two other schools, one in a poorer and the other in a wealthier district than the first one selected, were also equipped as social centers and activities of the same general character were set in motion at each. Civic clubs were organized not only at the two new centers, but also in other schools until about half of all the public school buildings in the city had become the meeting places of these organizations. Two years after the formation of the first civic club there were

SCHOOL AS A SOCIAL CENTER

sixteen clubs with 1500 members and the adult organizations had formed a "League of Civic Clubs," whose motto was "For the City as a Whole." Besides these there were several singing clubs, orchestras, fencing clubs, and a "spontaneous Art Club." Through the co-operation of local art societies and the center officials a loan exhibition of paintings and drawings was held, and the librarians at the three principal centers ran bureaus of information for persons seeking positions. In the civic club discussions matters of politics, religion, free textbooks, and those involving capital and labor were freely admitted, but an effort was made in all controverted questions to have both sides presented. The social center was not to take the place of any existing institution, but its central purpose was to develop, according to Edward J. Ward, who organized the Rochester system, "the community interest, the neighborly spirit, the democracy that we knew before we came to the city." The administration of the centers rested upon the Board of Education, and the original appropriation of \$5000 with which they were established was obtained from the Common Council through the combined efforts of eleven local voluntary organizations of public-spirited people. The centers were closed in March, 1911, through the failure of funds, but they were opened again the following year, though in a modified form. Supervisors are now employed by the Board of Education only for the young people's club work. Adult clubs aspiring to use the schoolhouses are charged a fee unless their meeting comes upon a night when the schoolhouse is open for evening school or recreation center purposes, and few such clubs are now in existence.

In the sixteen social centers which have been established in the Chicago public schools "an attempt has been made to restrict the recreational activities to those that stimulate development of mind as well as body." In the selection of games "special care was taken to eliminate all features in which chance was a factor." These quotations illustrate the educational and ethical motives which set the standards in the reading rooms, gymnasiums, singing, dramatic, and orchestral groups that are found in these centers. They are open two nights a week, for the most part, and are administered by a special corps selected from the regular teaching staff, who are paid by the board of education and take their orders from the first assistant superintendent of schools. A number of volunteer social workers also assist. In Detroit social centers conducted in a similar manner are supported by the school board in four schools.

Those which are maintained in eleven Philadelphia schools by the Home and School League, the Civic Club, and allied organizations, offer, in addition to the usual program of folk dancing, calisthenics, games, singing,

SCHOOL AS A SOCIAL CENTER

and club work, many varieties of handwork of such a character that they can be easily performed in the ordinary recitation room. The workers who are part paid and part volunteer are selected and directed by the volunteer societies, while the school board furnishes the light, heat, and janitor service. Following a survey of the city's recreational needs and facilities, a referendum was held in Milwaukee in the spring of 1912 which authorized its board of school directors to levy a two tenths of a mill tax for the support of social centers and other recreational work. This will yield about \$88,000 annually, and the organization of this work under a superintendent and staff has already been accomplished. The school social centers of Columbus, Ohio, were inaugurated by the local School Extension Society, but are now carried on under a municipal department of public recreation. In Louisville, Ky., they were started by the Women's Club with the cooperation of the Men's Federation and the school board. A revival of the school center in Boston was brought about during the winter of 1911-1912 by the Women's Municipal League. Two skilled social workers were employed to conduct an intensive club work in the East Boston High School, and the undertaking has succeeded so well that it has been taken over by the Boston School Committee and similar opportunities will be afforded in other schools. In Jersey City the School Extension Committee obtained permission to hold weekly public dances in several schools, which met with such success that now they are supported by the school board, while the Committee still cooperates in the supervision of the dancing and the development of clubs among the young people who attend them. Along with its other recreational undertakings the Pittsburgh Playground Association, a large part of whose funds are appropriated by the municipality, maintains centers during the winter in two public schools. These instances illustrate the principal factors in the initiation, administration, and support of this institution as it now exists. Its present extent in the United States is approximately shown by a survey covering the season of 1911-1912 which was made by the Russell Sage Foundation and which may be summarized as follows. forty-four cities reported centers at which there were paid workers; in nineteen of these the workers (in some only a part of them) are paid by the board of education; fifty-seven cities reported schoolhouses which were locally known as social or recreation centers, though they were conducted entirely by volunteer workers; in eighty-four of all the cities reporting centers the heat and light are furnished by the school board; in seventy-two the heat, light, and janitor service are provided by the board; in fifteen the board bears the total expense; total amount of money reported as expended in the maintenance of

school centers, \$139,535 73, total number of schools used in the 100 cities, 338.

While the social centers established up to the present time exhibit chiefly recreational, social, and cultural aspects, there are tendencies which indicate the future development of important civic attributes. The need of suitable places for political meetings which has been forced upon the public consciousness by the problem of campaign contributions has brought forth the suggestion that school buildings be used for that purpose, and, as has already been stated, they are now being so used in several large cities. If this movement grows, school boards will be obliged to provide the administrative machinery for regulating the holding of these meetings. Whether or not this task will fall upon the social center staff or upon the day-school officials remains to be seen. Mr. Ward, who is now promoting the civic center idea as a staff member of the University Extension Division of the University of Wisconsin, favors the designation of school principals as "civic secretaries" with power to effect the organization of citizens into deliberative bodies meeting in the neighborhood school. In a modified form this idea has already taken root in Duluth, Minn., where the Board of Public Welfare has been granted an appropriation for a civic secretary.

The Kentucky legislature has recently made it legal to permit the use of school buildings for "any lawful assembly of educational, religious, agricultural, political, civic, or social bodies," and effective measures are provided to insure that such privileges shall be granted when properly requested. The school laws of Oregon permit the use of schoolhouses "under careful restrictions, for any proper purpose, giving equal rights and privileges to all religious denominations or political parties." In Pennsylvania the new school code allows the board of school directors to permit the use of school grounds and buildings "for social, recreation, and other proper purposes," while the Massachusetts legislature has recently decreed that the temporary use of school buildings may be had "upon such terms and conditions and for such public or educational purposes as the said school committee may deem wise." The Wisconsin law provides that school directors in the larger cities are authorized to "establish and maintain for children and adult persons, in school buildings and on the school grounds, under the custody and management of such boards, evening schools, vacation schools, reading rooms, library stations, debating clubs, gymnasiums, public playgrounds, public baths, and similar activities." It is further provided that if the school board should refuse to proceed as authorized by the act, the question may be decided by a local referendum, and if a majority of the electors favor the proposition, then the

board is obliged to undertake such activities as are legalized by the act and requested by the people. Legislation providing for similar extensions of schoolhouse privileges is also contemplated in other states.

Public Lectures—The beginnings of a popular use of schoolhouses have been made in many cities through the holding of public lectures. Sometimes these are held under the auspices of the local teachers' association or a charitable society, and in these cases tickets of admission are sold for the purpose of raising funds. In many places the superintendents of schools arrange lectures upon professional subjects for the benefit of the teachers; in some instances the topics have a broader cultural value and the public at large is also invited. In other cities this function is performed by a committee of the board of education. An example is found in Cleveland, Ohio, where the committee on Social Center Development arranges each year a program of lectures and entertainments in some fifty-seven schools. All of the performers contribute their services and the work has the cooperation of the D A R, the local musical organizations, clergymen, professional men, and public-spirited citizens. Over a hundred programs are given annually to an aggregate attendance of 30,000 people. In New York City, where this work has had its largest development, there is a Department of Public Lectures whose head is coordinate with the superintendent of schools and reports directly to the board of education. This department originated through an act of the state legislature in 1888, by which the school board was "authorized and empowered to provide for the employment of competent lecturers to deliver lectures on the natural sciences and kindred subjects in the public schools . . . in the evenings, for the benefit of working men and working women." It was further enacted that no admission fee should be charged. In 1901 the wording of the enactment was amended so that the board was given power "to maintain free lectures and courses of instruction for the people of New York." In 1911 lectures were given to over 5000 audiences aggregating a total attendance of 987,340 people. These took place in 177 centers, the majority of which were public school buildings, at a per capita cost per lecture of eleven cents. Over 1800 different topics were treated in these discourses, most of them illustrated by stereopticon slides. A wide range of subjects was covered, including among others literature, history, social matters, fine arts, general and applied sciences, physiology and hygiene, descriptive geography and travel. Many of the lectures came in courses, and examinations are conducted for the benefit of those desiring to carry on systematic studies.

Parents' Meetings.—The use of schools by adults is also brought about by the meetings of

A Girls' Literary Club, Brooklyn

A Neighborhood Dance, Jersey City

A Singing Class, Chicago

Metal Work, Jersey City

Athletic Contest, New York City

A "General Evening," Rochester, N. Y.

THE SCHOOL AS A SOCIAL CENTER

parent-teacher associations (see PARENTS AND SCHOOLS) and the various entertainments and occasions provided in the course of their activity. Some notion of the extent of these organizations can be obtained from the fact that branches of the National Congress of Mothers with which most of them are affiliated exist in over thirty states. The many ward improvement associations which are meeting in schoolhouses to discuss better lighting or transportation facilities and similar matters germane to neighborhood life illustrate another phase of the movement that is making the public school more and more a center of community activities.

Rural Schools.—The socialization of the rural school is proceeding in much the same manner, though more slowly, through changes (a) in the curriculum and teaching methods, (b) in the undertakings of the teacher besides the regular teaching, and (c) in activities on the school premises outside of day-school sessions.

(a) The tendency to base the language work upon those facts of nature which are of immediate interest to the farmer and to introduce crop accounts into the arithmetical instruction are typical examples of the manner in which attempts are being made to give an agricultural content to the traditional formal curriculum of the country school. In certain localities of Virginia a survey is made of the existing and possible industries, and then training preparatory for carrying them on is introduced into the school program. In many of the colored schools of the South, especially, as well as white schools in other parts of the country, domestic science work is provided for girl pupils, while a number of states now make agriculture a required subject in the rural elementary course. The frequency with which the problem of correlating industrial and academic subjects is found upon country teachers' institute programs indicates the widespread character of this movement. The consolidation of schools which is now proceeding rapidly in various sections is also making possible a closer adaptation of rural schooling to the future needs of the pupils. The experimental farm, laboratories, assembly rooms, libraries, and playground apparatus which are practicable in the centralized schools will all help to make them the social and cultural, as well as educational, centers of their respective constituencies.

(b) The teachers trained in Hampton Institute are accustomed to organize and conduct clubs among their young people and to arrange meetings with the parents. By means of quilt contests, kitchen openings, and other occasions which bring the neighbors into the schoolhouses, they obtain apparatus for the schools and raise funds for improving school property. Schoolrooms are decorated, cement walks are laid about the schoolhouses,

and the grounds beautified with hedges and flowers. Some of the funds are expended in water coolers and individual cups and better toilet arrangements. Through the efforts of these teachers about 200 improvement leagues have been opened in connection with the colored rural schools of Virginia. In the Henrico rural schools and those of other counties, frequent exhibitions are held of pupils' handwork from both shop and kitchen, while patrons' meetings are a regular feature of the term program. The graduates of Tuskegee also are carrying on similar social work in the communities where they teach. In Georgia the Berry School, where scientific agriculture and housekeeping are taught in a most practical manner, has served as a model for eleven other schools which have been established in that state.

(c) The agricultural clubs which have an estimated membership of over 200,000 boys and girls are not only stimulating an improvement in crop-raising methods, but focusing the attention of their many communities upon the schoolhouse as an economic force and asset. There are not only hog and corn clubs for the boys, but also canning, tomato, and poultry clubs for the girls. Barley- and oat-growing tests are also carried out by some of these organizations. This movement is being stimulated by the United States Department of Agriculture, agricultural colleges, and county superintendents of schools. In Winnebago County, Illinois, a silo and alfalfa census which was taken in 1910 through the schools illustrates one of the various methods employed to relate education to the life of the community. The demonstration of Babcock milk testers and the running of germinating tests for seeds as practiced by rural teachers in many districts throughout the country exemplify some of the other ways in which the machinery of the rural school is being adapted to local needs. In Ohio, township boards of education are authorized to appropriate annually \$250 from school funds for district school libraries; and, not only in this state but in others, bookcases with glass doors, tables spread with magazines, and racks containing agricultural bulletins form a regular part of the schoolroom equipment, and these facilities are patronized by the adults as well as by the young people of the community. Growing out of the agricultural clubs are exhibitions and festivals, which are held in the schoolhouses in the evening and on holidays. The principal of an agricultural high school in Maryland has organized clubs among the farmers and arranged courses of evening lectures for them upon technical agricultural subjects. For the women a series of monthly meetings are held on Saturday afternoons when the latest methods of housekeeping and various home crafts and the decoration of rooms are discussed and studied, while the cultural life of the community is stimulated

by debates, spelling bees, and other literary exercises. The "Hesperia movement," which attracted attention some years ago, refers to the meetings and social occasions held under the auspices of the teacher-parents' associations of western Michigan. In several Wisconsin counties, also, farmers' clubs have been organized by the county superintendent to meet in school buildings, while in others spelling contests are arranged which include social and literary features. In the southwest and the northwest, societies specifically called "social center" organizations are meeting in rural schools, the members of which often travel many miles to attend the evening functions. In these and other regions the country school is informally used for dancing parties or religious gatherings. The school-farm movement which has started in Wake County, North Carolina, involves the cultivation of from two to ten acres of land surrounding the schoolhouse and the sale of the crops for educational purposes; and since it brings about gatherings of the farmers in working bees, it is having a decided social effect upon the community. The Country Department of the Y.M.C.A. is furthering a solidarity of rural interests through the organization of athletic meets in which teams from various schools throughout the district compete for trophies and prizes. In Texas an active social center movement is being promoted by the proprietor of an agricultural publication, who not only devotes the columns of his journal to it, but in November, 1911, financed a social center conference that was attended by delegates from all sections of that country, and who is furthering, also, the spread of school libraries. Through the influence of such positive propaganda and the incidental effects of the other forces that are improving country life, the rural schoolhouse is being restored to that important rôle which the history of New England has attributed to the "little red schoolhouse."

Europe. — The social aspects of foreign public education relate chiefly to the school's primary function, the preparation of the young for adult life. On the pedagogical side, they embrace mainly the introduction and extension of manual training, domestic science, and vocational instruction of all sorts in day and continuation schools, and, on the physical side, gymnastics, medical school inspection, provision of meals, open-air schools, sex instruction, and special schools for defectives. (For more detailed information see the respective topics and the accounts of education in the various countries.) The close adaptation to a wide variety of vocational needs which is exhibited by the Fortbildungsschulen of Germany, especially in Munich, together with the civic and cultural motives behind the system, are especially noteworthy in this connection. Another institution showing distinct social motives in its origin is found in the folk high

schools existing in Denmark and some of the other Scandinavian countries. The students' hotels or "scholars' homes" which form a part of the secondary school system of Switzerland have also a sociological interest. The public care of young children, which in several continental countries begins in babyhood through the provision of crèches, is continued in France by means of the *école maternelle* until the kindergarten age, and is further maintained during childhood by the *école de garde*, which looks after them during their play hours. At the upper end of the school-age period Germany is most lenacious, having a continuation system that compels the attendance, in some of its states, of all apprentices under eighteen years. The material attention to school children in France extends not only to the furnishing of their meals at the cantines, but, in the case of poor children, to assistance with clothes through the *caisse de écoles*, while mutual aid societies, affording pecuniary relief to needy scholars, are quite general. In British countries thrift is promoted by school banks, while the head masters frequently help their graduates in finding suitable employment; and in London and several other English cities there are after-care committees among the local authorities which follow the careers of pupils and extend assistance when necessary. In Denmark about one third of the town pupils spend their vacation seasons in the country, largely at holiday camps organized by the Elementary School Teachers' Association. "School journeys" and vacation excursions are promoted by school and voluntary agencies in England, France, Germany, and several other countries. Physical training, especially in central and northern Europe and in England, is unequivocally accepted as a responsibility of the public school, and gymnasiums and baths are very generally provided, while the conduct of calisthenics and swimming lessons are regular tasks of the teacher. Open games and athletic sports are also promoted in these countries as well as in Norway, Scotland, and Australia. In the last-named country, where large playgrounds customarily adjoin the schools, and in the famous private schools of England, field sports are recognized as distinct means of developing *esprit de corps* among the pupils, and the older boys are drilled as cadets and taught rifle shooting. School gardens are found in Australia, New South Wales, Canada, France, and several other European countries. School societies of one sort or another flourish more or less in all the leading systems, while the inculcation of patriotic ideals through the celebration of national holidays is quite general.

The activities which involve a utilization of the school plant outside of the regular instruction periods and which are most often initiated by some organization not connected with the educational system are more common in England, Scotland, and France than they

are in the other European countries. In the British Isles these are usually of a recreative character, and the organizers are such voluntary societies as the Children's Happy Evenings association, Play Centers committees, Games guilds, Vacation schools, Boys' and Girls' brigades, Boy Scouts, etc. A canvass made in 1911 by the National League for Physical Education and Improvement showed that of the 324 education authorities in England and Wales, 24 gave general facilities for organized games, 26 granted permission to use premises, and 13 granted some financial aid. In 1904 Mrs. Humphry Ward organized an Evening Play Centers Committee to carry on in the London County Council schools a recreational program modeled upon that afforded in the Passmore Edwards Settlement. According to a report of the Committee —

The centers are open five evenings a week, from 5.30 to 7.30, and on Saturday mornings, during forty weeks in the year, for boys and girls between the ages of five and fourteen. The children attached to each center are chosen, in the first instance, by the teachers of the four or five schools, as the case may be, within easy reach of the center, who are asked to make the need of the children their basis of choice. A child normally attends a center twice a week, but a third attendance is allowed for library or quiet games, and each center has a list of children who for reasons of special need are allowed to attend every night. The roll of a center is usually from 800 to 1000 children, and the average weekly attendance at a full center during the winter terms is about 2400. Each center is under the direction of a paid superintendent, who is responsible to the play centers committee, and is assisted by both paid and voluntary workers. The occupations include: musical drill, dancing, singing games, gymnastics, woodwork, cobbling, basket-work, painting, plasticine modeling, needlework, knitting, quiet games, and reading, while there is always a toy room for the little ones.

The London County Council lend the buildings and give free cleaning, caretaking, heating, and lighting. During the summer of 1911 the same committee carried on playground activities in twenty-six schools in various parts of London. In Paris choruses, meeting in public schools, are organized by singing teachers among former pupils, and there is also a vast amount of popular education which is voluntarily extended to the laboring classes by such associations as the Polytechnic, the Philotechnie, the *Union française de la jeunesse*, and similar organizations. Their lectures and study classes are held in the schoolhouses and are enjoyed annually by many thousands of people. In France, also, the school libraries are frequently open to parents as well as pupils. The schoolhouses of England are let for Sunday schools, political meetings, for use as polling

places, and for other purposes in accordance with a regular scale of fees, and the income from this source during a year amounts in some cities to a considerable sum. While parents' meetings are held in the schools of Finland, New South Wales, England, and several other countries, the practice of rousing a popular interest in educational affairs by this method is not very general. In some German cities there are local committees of perhaps a score of prominent parents who are organized and take an active interest in school affairs, and here, as well as in England, representatives of trade guilds and manufacturing concerns are found upon the committees charged with the conduct of continuation schools; but nowhere in Europe is there the amount of popular participation in the administration and enjoyment of public educational facilities as is attained by individuals and associations in the United States. SCHOOL COMMISSIONER — The term is used rather loosely in the United States, being applied both to members of school boards and to the chief executive officer of school systems. In Baltimore and Indianapolis, for example, the city board of control for the public school system is called a board of school commissioners, instead of the much more common term of board of education. In Maryland, also, the term county board of school commissioners is used for what is elsewhere termed county board of education. In Massachusetts and New York and in Porto Rico, also, the chief school officer of the state is designated as commissioner of education instead of the more usual term of superintendent of public instruction. In Ohio the chief state school officer is known as commissioner of common schools, and in Rhode Island as commissioner of public schools. The term is also applied to the chief educational officer of the United States, who is known as the United States commissioner of education. E P C

SCHOOL COMMITTEE. — A term used very generally in the New England States for what is elsewhere known as board of educa-

SCHOOL DISTRICT

tion, board of school trustees, or board of school directors. The use of the term is historical, and dates back to the time when the board for school control was merely a committee on schools of the town board of selectmen (trustees, or council). E P C.

SCHOOL DISEASES. — See **CONTAGIOUS DISEASES, INFECTIOUS DISEASES**; **MEDICAL INSPECTION**.

SCHOOL DISTRICT. — A term applied to the smallest unit of school management. There are various forms of the district, as follows —

(a) *The Common School District* — A certain variable and usually irregular area, of varying size, the boundaries of which are formed and changed by authority to suit the convenience of the residents, and the people of which unite in the partial or complete support of a school or schools. It is next to the oldest unit of school organization in the United States and the smallest civil division recognized. Usually it is a small area, varying from one or two to ten or sixteen square miles, though in sparsely settled states a district is not infrequently of large area. The tendency has been to subdivide the district in order to bring the school nearer to the child. Frequently districts have not more than half a dozen families, and districts with but one family and even with but one child have had a legal existence. A district may be subdivided to form a new district, may part with a portion of its area to enable some resident to become a member of an adjoining district, so as to enable his children to attend a nearer school; and may have territory from other districts added to it for this or other purposes. A schoolhouse is located at some point in the district and a school is maintained. The local governing authority for rural school districts is commonly a board of three district trustees, or district school directors. (See **DISTRICT BOARDS OF TRUSTEES**; **DISTRICT MEETING**; and **DISTRICT SYSTEM**.)

The school district being the unit, the term is also applied to larger areas than the rural school district. It may be coincident with a

SCHOOL ECONOMY

town or township, as in Connecticut and Indiana (See **Town System**; **Township System**.) A city with a large and complicated school system is in reality only a school district grown large, and in many states it is so regarded. (See **CITY SCHOOL ADMINISTRATION**.) Hence a school district may be governed by a board of school trustees or school directors (usually three), as in rural districts; by a township trustee (Indiana), or trustees (Ohio); by a town school committee (New England); or by a city board of education.

(b) *Joint District* — A term applied to a school district lying partly in two or more civil divisions, as in each of two townships, or two counties. The district is governed locally, just as a common school district, but it reports to and is governed by the township or county authorities of only one of the two or more civil divisions, usually the one in which the schoolhouse is located.

(c) *Union and High School Districts*. — A union of two or more districts for some educational purposes, such as a union of school districts with the transportation of pupils to a central school (see **CONSOLIDATION OF SCHOOLS**), or a union of a number of common school districts to form a high school district, known as a union high school, the districts keeping their identity for elementary school purposes, and paying their quota for the support of the high school. Joint union high schools may likewise be formed by the union of districts lying in two or more counties. (See **SCHOOL UNIONS**.)

(d) *Special or Independent Districts*. — These are districts organized under special laws, and are usually granted some special privilege. The most common of these are the special tax districts, formed, generally, in the southern states, where a town or city is allowed to organize as a special tax district, levy special local taxation, and enjoy certain special privileges. See articles on the state systems of Arkansas, Georgia, and Iowa, which contain examples of this form of district. In some cases, such special tax districts escape paying their proper share of any county school tax levied, and thus work injury to the rural and small town schools. The so-called independent school districts of Iowa are good examples of this, as are also the town and city school systems in a number of other states. E. P. C.

SCHOOL FUND COMMISSIONERS. — A state body, known by this or by some analogous title, is to be found in many of the Western states. Sometimes the board is known as a Board of School Fund Commissioners (Kansas), but more frequently as a State Board of Land Commissioners. Such boards have control of the sale of lands granted to the state by the national government (see **NATIONAL GOVERNMENT AND EDUCATION**) for all educational and other purposes, and of the investment of the funds accruing from the sale. Colorado, Kansas, Montana, Nebraska, North Dakota, Oklahoma, and Oregon are examples of states having such state boards. The governor, the secretary of state, the state treasurer or auditor, the attorney-general, and sometimes the state superintendent of schools form such boards, the number of members varying from three to five. In other states the state board of education is charged with the care of the school fund (Pennsylvania), or some state official, such as the surveyor-general, is charged with the preservation and sale of the lands, and the state treasurer (California), or the state comptroller (New York), is charged with the proper investment of the school funds. In Rhode Island there has been for a long time a single state official, known as the commissioner of the school fund, who has been charged with the care and the proper investment of the fund. E. P. C.

SCHOOL FUNDS — There is no uniformity in the use of the terms "common school fund" and "school fund" in the United States. In some states these terms are used to designate permanent endowments, in others annual revenue derived from a variety of sources. In Indiana, New York, Oregon, and Washington Common School Fund is the official title of a permanent state endowment for common schools. Georgia uses the same term to designate the total public school revenue derived from fourteen different sources; Kansas, to designate the total annual revenue for common schools derived from all sources, Nebraska, the income from the state taxes, fines, forfeitures, and interest on permanent school funds, Ohio, the income derived from the school tax.

Common or Permanent School Fund Defined. — This article is concerned with none other than permanent common school funds,

by which term is meant a fund, the principal of which the state constitution or laws provides shall be kept permanently invested, and whose income alone, therefore, can be devoted to the support of common schools. The title most widely used in the United States with reference to such funds is Permanent School Fund. Some fourteen states use exactly or approximately this title, whereas only four, mentioned above, employ Common School Fund. The principal may be held by the state or divided among and entrusted for care and preservation to the counties, towns, cities, and villages, as in Indiana and Missouri. This class of funds differs from permanent local funds in that they owe their origin to an act or grant which made provision for the entire state or territory or for the component units of the same, townships or counties, and did not originate in some act, grant, bequest, or gift for one or only a limited number of communities or institutions within the state. Many cities, townships, and schools do possess funds of this strictly local type.

Origin.—The beginnings of the establishment of endowment funds for schools are discussed under the caption *Endowments* (q.v.). The grants of land made in colonial times were special or local. They did not represent a policy adopted for the entire commonwealth. The next step toward a system of general endowment of schools was the reservation by the colony of land for schools in towns yet to be settled. In 1720 Connecticut divided five townships into fifty-three parts; three parts of each town were reserved, one for the support of a school and two for the ministry. Between 1783 and 1785 Connecticut sold seven towns, divided the proceeds among the towns of the colony already settled, and provided that the proceeds be set apart by each town as a permanent school fund. From the proceeds of the sale of these town lands, consequently, two classes of permanent school funds arose: the first, the fund belonging to the colony, which was distributed among the towns of the colony; the second, belonging to the new towns, rising from reservations of school lands within the towns.

The Connecticut colonial policy was early copied after the formation of the Union by Georgia, New York, Massachusetts, and other states. In 1783 the governor of Georgia was empowered to grant each county of that state one thousand acres of vacant land for erecting free schools. New York, in 1780, provided that in the unappropriated lands of the state two lots, "a gospel and school lot" and a "state lot," should be reserved in each township; the first lot for the support of the gospel and schools within the township. Massachusetts in 1788 provided that in the disposition of all towns thereafter one lot of 320 acres should be reserved for the support of common schools in the township.

Types of Funds.—In the evolution of permanent school funds in the United States, just traced, five types are evident: (1) Funds arising from private gifts and bequests; (2) funds arising from the reservation of lands by the town for the support of schools within the town; (3) funds arising from the proceeds of the sales of unsettled land for the benefit of already settled units of the commonwealth; (4) funds arising from grants of lands to particular towns by colonies; (5) funds arising from the sale of school lands by states, in towns yet to be settled, for the support of schools within the town. The permanent school funds in the United States originated from a further extension of the policy represented by the last type. It was only necessary for the states and the federal government, after the formation of the Union, to adopt this policy for unsettled lands which were later to be formed into states, to bring about the creation of state permanent common school funds.

Permanent school funds in the United States may be divided into two classes according to their origin—state and federal. Federal funds have been derived, broadly speaking, from two classes of sources: (1) lands owned by the United States, reserved for schools when the territory was first surveyed and granted to the individual townships or to the state, when the state was admitted into the Union; (2) federal moneys, including loans, grants, and appropriations.

Before the close of the Revolution, confusion and bitter antagonism reigned as the result of the conflicting state and federal claims to Western lands. Congress appealed to the states to cede their claims, pledging itself, on Oct. 10, 1780, to dispose of the ceded territory for the common benefit of all states, in a manner and upon condition of sale regulated exclusively by congress, and to form the territory ceded into states to be admitted into the Union upon a footing equal in all respects with that of the original states.

New York gave up her claims on Mar. 1, 1781, and the other states followed her example. Virginia reserved for herself about 3,300,000 acres of land, known as the Virginia military reservation, for the benefit of her military troops. Connecticut made her first cession on Sept. 14, 1780, but reserved for herself an area of about 3,710,000 acres of land lying in the northeastern corner of Ohio, known as the Western Reserve.

Without waiting for Connecticut's cession of her claim, congress, by an ordinance passed in May, 1785, had provided for the survey and sale of its public domain in the West. Two years later, namely, in 1787, an ordinance was passed which reaffirmed the spirit of the ordinance of 1785, but made no specific reservation of lands for common schools, but in the contracts for the sale of Western lands made thereafter lot 10 of each township was set

SCHOOL FUNDS

aside for schools and two townships in each territory or state for an institution of higher learning. In the act establishing the territorial government for Oregon in 1848 and for Minnesota in 1849, it was provided that sections numbered 16 and 36 of each township should be reserved for the use of schools, and since then all new states admitted, except Texas and West Virginia, have received the two sections, while Utah, Arizona, and New Mexico received four sections in each township for schools. Of all the federal lands which have been employed by states to establish permanent common school funds, the sixteenth and thirty-sixth sections have contributed most. However, no inconsiderable portion of these funds has been derived from federal grants of lands given to the states, in many instances, for a particular object other than schools, but under such conditions that it was possible for the states to devote the proceeds to education. Among such lands may be named salt lands, lands granted for internal improvement, swamp lands, military, and, in the case of Arkansas, two townships granted for a state university. The 5 per cent of the sales of public land fund has also been added to the school fund by many states, and the distribution of the surplus revenue by the federal government in 1837 has also been an added source. The details as to these different national grants for education are traced at length under NATIONAL GOVERNMENT AND EDUCATION, to which the reader is referred. See also the articles on the different state school systems, ALABAMA, ARIZONA, etc.

State Lands as Source of Permanent Common School Funds of State.—Though some of the eighteen states received no grants of lands from the federal government for common schools, every state and territory, with the exception of the District of Columbia and Alaska, has at some time possessed such a fund. The sources from which such funds have been derived fall naturally into two classes—state lands and state moneys. The Literature Fund created by New York in 1786 is the oldest permanent public school fund in the United States. Today New York combines the income of all her permanent funds, thus making no distinction between her Literature Fund and her Common School Fund. The original purpose of the fund was not, however, to aid common schools, but to aid academies and training departments for teachers in such academies. Pennsylvania in 1786 passed an act setting aside 80,000 acres of unappropriated land for the purpose of endowing public schools. It does not appear, however, that these lands were ever devoted to a permanent fund, as the Common School Fund of Pennsylvania seems to have been first actually established in 1831. Connecticut, therefore, has the distinction of having created, in 1795, the first permanent common school fund, known as the School Fund of Connecticut. It was shown in a preceding paragraph

SCHOOL FUNDS

how Connecticut came to possess about 3,300,000 acres of land in Ohio. This land was sold for about \$1,200,000, which sum the state set aside as the principal of a permanent fund, the income of which was to be forever devoted to the support of schools. New York, by an act of legislature, Apr. 2, 1805, provided that the net proceeds of 500,000 acres of state lands should be appropriated as a permanent fund for the support of common schools. Georgia, by acts in 1817 and 1818, New Jersey in 1817, reserved state lands for the same purpose. The permanent school funds of Maine and Massachusetts were both derived from lands lying in Maine, at one time all owned by Massachusetts.

State Moneys as a Source of Common School Funds.—The moneys and sources of moneys which the states have devoted to their permanent common school funds include the proceeds of licenses, escheats, confiscations, fines, forfeitures, taxes on banks, direct taxes, appropriations, gifts, lotteries, slave moneys, moneys for exemption from military service, funds previously established, toll rates, sales of lumber, grass and mineral products on lands, etc.

States possessing Permanent School Funds.—The District of Columbia and Alaska have never possessed a general permanent common school fund, nor reservations either of land or of money with which to establish such funds. Pennsylvania and Georgia formerly had permanent common school funds, but to-day possess none, except that in Pennsylvania a new state school fund has recently (1911) been created. Georgia devotes state revenues derived from railroads and land rents and from certain bank stocks to the support of common schools. The remaining states and territories all possess one or more permanent endowment funds for common schools, or an account which is a recognition of the state's permanent indebtedness to such a fund, the principal of which has been expended, diverted, or lost.

The permanent common school funds differ greatly in value in the different states. Texas possesses two. In 1905 the combined principal of these two funds amounted to \$52,660,480. Minnesota's fund, next in size, in the same year amounted to nearly eighteen million dollars (\$17,824,135). The two states having the smallest permanent common school funds are New Hampshire and South Carolina. The principal of the former's fund amounted to \$59,470 in 1905, the latter's in 1906 to about \$46,000.

School Lands.—The inequality of the funds in different states is due to a large extent to the difference in the value and area of the school land reserved in the state. As has been shown, eighteen states received no grants of federal lands for common schools, twelve received one section in each township, or approximately one thirty-sixth of their entire territory for this purpose, fifteen received two sections, or one

eighteenth of their entire area, and three received four townships, or one ninth of their area. In some states the lands were disposed of almost immediately after the state was admitted into the Union; other states still possess thousands of unsold acres of school lands. As the sections reserved were selected according to an arbitrary scheme of survey, without reference to the value or absence of value in some states, a considerable portion of the school land lay in desolate regions, whereas in other states they were situated in extremely valuable land. It is impossible at the present time to secure a satisfactory estimate of the value of unsold common school lands. The estimates given are in many cases based on surface area, and do not include the value of such products as minerals, oils, etc. In Minnesota in 1904 the unsold school lands on this surface area basis were estimated as worth \$5,354,088.47. Since this time an effort has been made to determine the value of the ore and timber on these lands, with the result that the prospective value of the permanent school fund of Minnesota was in 1908 estimated at \$125,000,000. At the present time acreage or surface value is the only basis that can be secured from all states, a basis which, it must be clear from these facts, is thoroughly unsatisfactory, not to say misleading.

Intact Funds and Credit Funds.—In many states the principal of the permanent common school funds and moneys which should have been added to such principal have been invested so carelessly, squandered, diverted, wasted, and embezzled so shamefully that what ought to be to-day a magnificent endowment, with an income affording an appreciable relief from taxation, has dwindled to an almost negligible sum or exists as a permanent state debt on which interest is paid out of taxes levied on the present generation. The causes of loss have been many, among which may be named the selling of lands below value, the lax terms of sale, failure to record deeds of sale, losses through bad loans, unpaid notes and interest, embezzlement, losses through the Civil War, and losses due to the fact that moneys devoted by law to the fund are not added to it. As the result of these facts and conditions, funds fall naturally into two classes: intact funds and credit funds. Intact funds represent a real productive investment. Connecticut, Massachusetts, Maryland, Oregon, South Dakota, Utah, and Wyoming, are among the states which appear to have kept their funds intact.

There are three classes of credit funds: (1) Class one includes funds the principal of which has been lost or diverted outright, but which is recognized by the state as a permanent debt, on which the state must pay annual interest at the legal rate. The funds of Tennessee, Kentucky, and the greater portion of that of Louisiana are examples of this class. (2) Class two is found in states whose laws provide that the state may expend moneys

belonging to the principal as fast as they are covered into the treasury, credit the amount to the fund, and pay interest on the permanent state account for common schools thus established. Maine, Michigan, and Ohio have pursued this policy. (3) Class three includes funds which, though not theoretically, yet are in part practically credit funds, whose moneys have been borrowed by the state, which indebtedness is represented by state bonds that will in all probability never be redeemed, and which consequently constitute what is practically a permanent state debt. The fund of California is in part a credit fund of this third class. In federal and state reports all three classes of funds are reported from year to year without comment, so that many states are frequently supposed to have permanent productive endowments for common schools which in reality have nothing but paper funds, accounts or debts which serve no other purpose than to be an additional source of taxation.

Importance of the Funds.—Owing to this failure on the part of federal and state reports to distinguish between permanent credit funds and intact permanent funds, the statistics given in such reports are misleading. The *Report of the United States Commissioner of Education for 1908* (p. 28) states that 47 per cent (.47) of the total receipts for common schools in the United States was derived from the income of permanent funds and rents. From what has already been said it will be seen that a very considerable portion of this amount was derived from taxes levied to pay the interest on the credit funds. The comparatively small percentage of the whole revenue for the support of common schools, derived from the permanent common school funds and land rents, is in danger of causing a misconception of their real present importance. Several states derive a large part of their school moneys from state endowments. Wyoming in 1900 derived 49½ per cent of her common school moneys from this source; Nevada, 47½ per cent. Texas in 1905 derived 29½ per cent; in the same year Utah and Oklahoma, over 20 per cent. Seven states, Oregon, North Dakota, Indiana, South Dakota, Nebraska, Delaware, Idaho, and Missouri, between 10 and 14 per cent. All other states derived less than 10 per cent, ranging all the way from 9½ per cent, Kansas, 1902, to 1½ of 1 per cent, South Carolina, 1906.

Management of Permanent Common School Funds.—The question, whether the permanent common school fund was owned and should be managed by the state or by smaller units, e.g. townships and counties, was easily settled in such states as Connecticut, New York, and Massachusetts, where the fund was created by act of legislature. But in states where the fund arose from the proceeds of the sales of township lands, the question arose whether the state had any right to supervise or control the management of the fund. The funds of this

SCHOOL FUNDS

origin earliest established were regarded as belonging to the townships and managed by the townships or by the state or county for the townships. However, a tendency to regard the state as the lawful owner and manager soon appeared, and every state since the admission of Michigan in 1837 has devoted its township lands to a public permanent state-controlled fund. At least six states continue to maintain these funds as township funds: Ohio, Indiana, Illinois, Alabama, Louisiana, and Missouri. Connecticut, since 1810, has employed a commissioner of the school fund, an officer whose sole duty is the management and care of the fund. Had the other states followed the example of Connecticut, millions of dollars would have been saved. In many states the management of the permanent common school funds is intrusted to a single officer, such as the treasurer or controller. In others it is managed by a state board of commissioners, in some by the state board of education.

It would be difficult to estimate the importance of the part which these funds have played in bringing into existence state systems of free schools in America. They set those systems in motion and kept them going. Prior to 1870 the policy of supporting free schools was considered a debatable question. Conditions existed quite universally in the United States in the earlier part of the nineteenth century, and continued in many states long after the middle of that century, which are difficult to describe and more difficult for the present generation to realize. Schools were rare, school buildings wretched and foul, the teachers untrained and ignorant, their wages small and uncertain. Some communities maintained no free schools, others supported free schools for a brief period. Taxation for schools, permissive in many states, compulsory in a few, frequently could not be levied owing to the hostile attitude of the public. There was almost no state supervision, and efforts to collect the most meager data proved futile. In the South and in a considerable portion of the East, free schools were looked upon as charity schools. State appropriations for free schools were frequently not applied for, in other cases the money was used for the support of private schools. Through the establishment of permanent common school funds, public sentiment has been educated, and the free school raised from a position of scorn and contempt to one of pride and social recognition.

Influence and Effects—These permanent funds were the first stable source of support of free schools in America. They did not, it is true, make the schools of their respective states free from the beginning in every case, but they supported those schools through periods of indifference and hostility. Through their influence the custom of depending on "rate bills," i. e. pupils' tuition fees, and other uncertain sources for the support of schools and

SCHOOL HOLIDAYS

the payment of teachers, was done away with. The influence of the permanent public common school funds has been turned directly upon certain portions of the school system through enacting provisions respecting objects to which the income of the funds might lawfully be applied, and also provisions regarding the conditions and methods of apportionment. The Connecticut school law of 1790 made teachers' wages and board the sole lawful objects of application of the income of the school fund. The failure of Connecticut to name any conditions which school districts must meet resulted in lowering educational standards. Local taxation rapidly fell off and the school fund of Connecticut was pointed to as a warning. The other states were wise enough to see that the evils in Connecticut were not due to the existence of the fund, but rather to the manner of distributing its revenue. New York in 1812, three years prior to the first distribution of the income of her common school funds, enacted that a town must raise by taxation a sum equal to its share of the revenue, in order to participate in the same. Many other states adopted the plan of New York, and a permanent school fund in such states consequently became a lever for compelling communities to raise local taxes for the support of schools. T. SCHOOL HYGIENE, INTERNATIONAL CONGRESS ON. — International congresses on school hygiene were held in Nuremberg in 1901, in London in 1907, in Paris in 1910; and the *Proceedings* are large and important collections of papers. The fourth international congress is to be held in Buffalo, U S A, August 25-30, 1913. The President for this congress is Charles W. Eliot, President Emeritus of Harvard University, and the secretary-general, Dr Thomas A. Storey, College of the City of New York. W. H. B.

SCHOOL HYGIENE ASSOCIATION, THE AMERICAN — This association, devoted to the scientific study and spread of information in regard to school hygiene, was organized in Washington in 1907. It holds annual meetings and publishes its proceedings. The permanent secretary is Dr Thomas A. Storey, College of the City of New York.

SCHOOL MANAGEMENT. — The field of School Management — "The term "management" has come to be applied to a specific problem of educational administration; namely, the conduct of the classroom. It is a problem primarily of the individual teacher, and consequently the terms "class management" or "classroom management" indicate rather more definitely the field that it attempts to cover. In view of the fact that it deals largely with routine procedures and aims to prevent waste by organizing routine upon an effective basis, the term "school economy" has been used by some writers as an expressive equivalent.

School management, as a body of educational doctrine, comprises a number of principles

and precepts relating primarily to the technique of classroom procedure, and derived largely from the practice of successful teachers. The writers in the field have interpreted these principles and precepts in various ways, usually by reference to larger and more fundamental principles of psychology, sociology, and ethics. Attempts have been made to derive practical suggestions for management a priori from these more general principles, but the basic sciences are still so far from adequate that this may generally be regarded as an unsafe method of attacking the problem. Where current successful practices are inconsistent with so-called principles, it is well to examine the principle carefully to determine its validity. Waste, confusion, and educational disaster have sometimes resulted from a failure to "make haste slowly" in working out the practical implications of plausible hypotheses which are misinterpreted so frequently as immutable laws.

Mass Education. — Most of the problems of management and practically all of the difficult problems arise from the fact that the school must deal, not with individuals as such, but with groups. How to secure the most effective conditions for the education of the group becomes then the central problem of management. Hence the importance that attaches in the doctrine of management to such topics as order and discipline, the daily program, the routine of moving classes, and the technique of study periods, blackboard work, constructive exercises, etc. Hence also the central position of the factor of habit; for the formation of effective habits in connection with the specific details of school work is the obvious method of systematizing routine and preventing waste. Mechanized routine, however, exists not for its own sake but to the end that the work for which the school exists may not be unnecessarily interfered with. Consequently, while habit is a central factor in school management, attention shares this central position, habit is the means, attention the end. Habits must take care of the mechanical details in order that attention may be devoted to those experiences which are more broadly educative. Throughout the entire discussion of management, the basic problem is to determine what organization of the mechanics of school work will best promote effective attention upon the part of the mass of pupils to the truly educative activities.

School management, however, differs from what is now known as "scientific management" in the business world in a very important particular. It touches the child intimately during a very impressionable period of life. The means which it employs to attain its end are in themselves factors in the general education of the child. In fact, some of the most important outcomes of formal education are universally admitted to be the habits and

ideals that come directly from the life of the school rather than from the subjects of the school curriculum which represent, in a much more abstract form, the crystallized experience of the race. The school experiences of the child should furnish, and in most cases undoubtedly do furnish, fundamental lessons in the art of living and working amicably and helpfully with one's fellow men. Recent theories of education explicitly recognize the importance of this factor, and by implication give to school management a significance that should do much to inspire teachers to a systematic study of the principles underlying the art.

Mechanizing Routine.—One of the first questions that the teacher must ask himself on taking charge of a classroom is this: What details of organization should be reduced as speedily as possible to the plane of unvarying habit? The answer to this question will vary with the size of the class and the age of the pupils. Large masses must obviously be more rigidly organized than small groups, if the essential activities of school life are to go on with a minimum of distraction. Older pupils can and should consider and respect the rights of others without depending upon specific rules, but the younger pupils have yet to acquire the necessary measure of self-control. In general, the following points may be considered in this connection.—

The Passing of Lines.—In all large elementary schools it is commonly necessary to organize a line formation for admitting pupils and for dismissing them. While this is not primarily the duty of the classroom teacher, the responsibility for his own pupils in line formation usually rests upon him. The aim must be to admit and dismiss pupils as expeditiously as is consistent with good order and a perfect control of the moving lines by those in authority. Quiet and order are especially important where pupils of different rooms of the same building are dismissed at different hours, either for recess or for the close of the session. It is well to insist from the outset that, whether pupils move in lines or without line formation, they should walk through the corridors and up and down the stairs. Where hundreds of children are congregated in a single building, too much care cannot be exercised to guard against anything that would unnecessarily increase excitement or prevent adequate control in the event of an incipient panic.

Disposing of Wraps.—In all schools this must be taken care of by a carefully considered system. Wherever possible, lines should be passed through the cloakroom in both entering and leaving the classroom, each pupil depositing his wraps in an assigned place. Where the cloakroom has but one exit, it is better to have the wraps collected by monitors after the pupils have entered the room, and distributed at dismissal.

Movements in the Classroom.—The passing of pupils to the blackboard or to the construction tables is likely to cause confusion unless organized upon a routine basis. The same is true of necessary movements involved in taking books and materials from desks. Some initial attention on the part of the teacher to matters so seemingly trivial as these will pay rich dividends in the aggregate of moments saved and confusion avoided. So small a detail as the packing of books and other materials in a uniform order in the desks will be well worth while.

Insuring Hygienic Conditions.—(1) **Posture.** So much of the time spent by the child in school requires of him the sitting posture that steps must be taken at the very outset to initiate correct and healthful habits in this regard. The proper structure of seats and desks is discussed in another section (see **DESKS AND SEATS, SCHOOL**), but even with the best desks and seats, there will be need for attention from the teacher in securing correct sitting posture. Where adjustable furniture is not provided, especial care should be taken that the pupils' feet rest squarely upon the floor, that the desk is not so high as to require a raising of the shoulder when the writing position is assumed, and that the desk overlaps the seat by a "minus distance." The most pernicious posture is that in which the pupil slides forward in the seat, supporting the body by the end of the spinal column and the shoulders, throwing the head far forward, and compressing the chest. The correct writing posture is, of course, particularly important. Specific demonstration of the correct postures should be given by the teacher, and the pupils required to assume one or another of these postures until adequate habits are formed. The program should be arranged so that the various exercises of the school day will permit a frequent change of posture. The correct standing postures may also be profitably demonstrated at the outset and appropriate habits developed. (2) **Ventilation and temperature.** Whatever steps need to be taken to insure an adequate supply of fresh air should be reduced to routine as speedily as possible. Unwholesome air will often accumulate so gradually as to escape detection, if one depends upon sense stimuli alone. Either the teacher or monitors appointed for the purpose must form the habit of attending to the conditions of ventilation at periodic intervals. The same rule holds in respect of temperature, especially where temperature is not automatically governed by a thermostat. (See **AIR OF THE SCHOOL-ROOM; HEATING, VENTILATION**) (3) **Cleanliness and neatness of the classroom.** The formation of habits that will prevent unnecessary untidiness in the classroom should be mentioned in this connection. The sharpening of pencils, the filling of inkwells, and the

disposition of waste paper are the matters that should be looked after systematically by responsible monitors. Pupils should understand that muddy shoes are to be cleaned before coming into the corridors or classrooms; mats, scrapers, brushes, and blacking should be provided for this purpose. In modern school buildings, ample lavatory facilities are available, and cleanliness of the person may be demanded. In any case, washbasins, hygienic devices for soaping, and paper towels should be provided in all schools. (4) The bodily functions. In rooms that are in charge of young and inexperienced teachers the privilege of "leaving the room" is especially likely to be abused. The encouragement of regular habits among the pupils with regard to the bodily functions is of prime importance. If recesses are provided during morning and afternoon sessions, it is a good practice in the elementary school to pass all lines through the latrines before the pupils go to the playground. In many modern schools, the practice of providing two large closets in the basement or in outbuildings has given place to the construction of closets on each floor and sometimes in connection with each classroom. Where this plan has been adopted, many of the evils associated with the basement or out-house closets are eliminated. At the same time, other evils are likely to be multiplied. In any case, the closet arrangement should permit the frequent and careful inspection of closets by some responsible officer of the school during school hours. (5) Moral health. This suggests the importance of providing by suitable routine against various other dangers that must always be considered when large masses of children are congregated within a small space. It may be too much to say that the teacher should know what his pupils are doing at every moment of the time during which he is responsible for them, but this should at least be the ideal toward which he should work. The supervision of recesses is a most important function of the classroom teacher unless the principal assumes this function alone. The likelihood is, however, that a part of the responsibility must be delegated to the classroom teacher. The janitors who are competent to be trusted with this important duty are very seldom to be found. In this connection, the danger of permitting pupils to congregate in the toilet rooms, in the corridors, or in segregated parts of the school grounds merits attention. While these groups may be engaged in quite innocent conversation, it is well for those in authority to be absolutely certain that mischief is not brewing and especially that the mental filth which finds so ready a lodgment in the minds of children is not spreading its corruption. There is no royal road to health in this connection. The teacher must ever be on the alert, not in a prying or spying way, but openly and

with a full realization of a most significant responsibility.

The task of mechanizing routine is simple in principle but difficult in practice. The gravest danger lies, perhaps, in making the routine too prominent in the eyes of both teacher and pupils. While, as has been pointed out, it may be looked upon as more than a means to the single end of schoolroom order, while the habits and prejudices that it engenders should be of large importance in the out-of-school life of the pupils, it is well for both teacher and pupils to look upon the necessary routine as particularly directed toward making the other activities of the classroom possible and profitable. Here, as elsewhere in the work of teaching, the attitude is all-important. If the pupils are unduly repressed and worried because of constant attention to the matters above discussed, every purpose of management is likely to be defeated. The very end that we seek is *mechanized* routine, — routine that is automatic in its operation. Wherever practicable, therefore, the pupils should be led to understand and appreciate the economy that effective habits will promote. Discussion with the pupils in the intermediate and grammar grades regarding the types of activity that may profitably be reduced to a mechanical basis should help in securing the attitude of cooperation upon which real success depends.

The opening day of the school is none too soon to initiate the necessary habits. The pupils are generally well disposed, and the teacher will have a good opportunity for breaking down their shyness and self-consciousness by the brief discussions recommended above. Too much, however, should not be attempted, and time should remain on the first day for some thoroughgoing class work. It is practicable and wise, however, to explain the more essential movements, and give a little practice in each. If this is done in the right way, the school will quickly settle into the desired routine.

Once these activities have been started, they should be insisted upon good-temperedly but firmly until they have become "second nature." Many teachers fail because they make the wrong start, others start right, but fail to sustain themselves. While initial focalization is the first law of effective habit building, the prevention of exceptions is the most difficult law to live up to.

The Daily Program.—Although closely related to the topic of routine, the problem of the daily program is so important and involves the consideration of so many subordinate problems that it deserves separate treatment. The characteristics of an effective time-table vary with the various grades and ages of pupils and with the type of school, but the following features are fairly constant: (a) The time-table should provide explicitly and systematically for instruction in all of

SCHOOL MANAGEMENT

the subjects that are required by the course of study, (b) it should preserve an equitable balance in proportion of time allotted between the "constants" and the "variables" of the curriculum, between subjects intrinsically easy and subjects intrinsically difficult, and between subjects the chief function of which is to leave with the pupils effective habits, subjects that are to result in information or knowledge, and subjects that are inspirational in their nature; (c) it should recognize the factor of fatigue, the necessity for effective variety in tasks assigned, and the necessity for periods of play, relaxation, and recuperation; (d) it should be constructed, as far as possible, in harmony with the findings of experimental education, (e) it must recognize the practical necessity of dealing with pupils in groups, and the consequent necessity of providing adequately for independent work by the pupils.

The Apportionment of Time among Various Subjects.—At present there are very few adequately determined standards with refer-

SCHOOL MANAGEMENT

ence to this problem. In most of the city systems the total available time is divided more or less arbitrarily among the different school activities, and the classroom teacher is expected to construct the daily time-table upon the basis of this apportionment. These schedules vary widely, although there are some undisputed points of uniformity. A very careful experimental investigation of this whole problem is badly needed. Pending the conclusions of such an investigation (and it would necessarily extend over several years), some one of the arbitrary standards should be selected as a tentative guide. The following prescriptions now in force in two typical city systems may be of interest in this connection. Newark is fairly representative of the cities that emphasize the "content" subjects; Cleveland of the cities that emphasize the "form" subjects; neither, however, represents the most radical tendencies in either direction. (The numerals in the first eight columns indicate the number of minutes allotted each week to the various subjects.)

CLEVELAND, OHIO

GRADE	I	II	III	IV	V	VI	VII	VIII	PER CENT TOTAL TIME

Recess	75	75	75	75	75	75	75	75	—

¹ No formal instruction in Grade I.

² First half year no number work; optional second half year

The above proportions may be profitably contrasted with the "ideal" allotment computed by B. R. Payne (*Public Elementary School Curricula*, New York, 1905, pp. 107 ff.):—

	PEN CENT OF TOTAL TIME
English (including reading, spelling, writing, grammar, literature, and oral and written composition)	27.5 ¹
Arithmetic	12.5
Geography	7.5
History and Civics	7.5
Nature Study	7.5
Drawing	5.0
Music	5.0
Physical training	7.0
Handwork	10.0
Opening exercises	10.0

¹ The corresponding proportion (including all language subjects) is 42.18 for Newark and 40.00 for Cleveland.

The general question of the relative importance of different subjects of the elementary school curriculum is too intricate and involved to be discussed here. It is sufficient to say that public school standards have been undergoing a process of transformation in America during the last two decades, and that many subjects are now recognized as "constants" in the curriculum which were not admitted at all twenty years ago. There can be little doubt, however, that the elementary school must always lay its chief emphasis upon the arts that are fundamental to social life. These are obviously the language arts, the arts of computation, and the arts of conventional behavior. The position of manual training, drawing, nature study, and music is already fairly secure, but the functions of these subjects have not as yet been clearly formulated. Of the instructional subjects, — the subjects that are to result primarily in facts and principles, rather than in specific habits, — geography, national history, and the principles of hygiene have an easily demonstrated right to first consideration. In general the following specific subjects may be tentatively assumed as integral and constant features in every American elementary school curriculum: (a) reading (including the mechanics of reading and some acquaintance with English literature), spelling, writing, oral and written composition; (b) the essential processes of arithmetic; (c) national history (including civics), geography, and the principles of hygiene. From the theoretical point of view, training in moral habits and in etiquette should be added to this list, but the prevailing tendency is not to recognize these explicitly in the stated program, but rather to insist upon their constant emphasis through the school life of the pupil. The supplementary subjects ("accessories" or "variables") are nature study, drawing, music, manual training, domestic arts, and physical training. The two last-named subjects, at least, are obviously of fundamental importance, but their status in the typical elementary curriculum has not been sufficiently standardized to permit their inclusion among the constants at the present time.

In constructing the daily time-table, the first task of the teacher is to provide adequately for the constant or fundamental subjects. These should be allotted the periods

of the day that are most favorable for the type of work involved. The unit of division is the recitation period, — the period during which the class meets with the teacher for discussion, recitation, drill, or examination. Definite maxima have been generally adopted in American schools for the recitation period in the various grades. These are known as Chadwick's standards and are as follows: Grade I, 15 minutes; Grades II, III, and IV, 20 minutes; Grades V and VI, 25 minutes; Grades VII, VIII, and IX, 30 minutes. These standards represent, of course, the maximal time to be given over to recitation, — not the total time to be devoted during each session or during each day to each subject, nor the briefest time during which any stated exercise may extend. Sometimes, indeed, it will be wise to shorten periods and multiply the number of times that a certain type of exercise is given during the day. This is particularly true of periods that are devoted to rapid drills. These should as a rule be not more than ten minutes in duration.

Provision for Independent Work. — Where two or more classes or groups occupy a single room and are in charge of one teacher, provision must be made for alternation of independent work (study periods) and class work (recitation periods). The daily time-table should indicate clearly the type of independent work that is customarily assigned for each study period. Certain subjects do not require this independent preparation; in so far as practicable, class exercises in these subjects should embody all of the pupils in the room. In the eighth grade, and perhaps in some cases in the sixth and seventh grades, one or two subjects may be prepared through assignments for home study. In general, study periods may, in two-class rooms, be allotted the same amount of time given to class work in the same subjects. Up to the sixth grade, the independent work in a subject should preferably either immediately follow or immediately precede the class exercise in that subject. Care should be exercised that independent work normally involving the writing posture (such as preparation of arithmetic lessons) should not immediately follow or succeed formal drills in writing or drawing or other work requiring the writing adjustment.

The Disposition of the Different Subjects in the Daily Program: the Factor of Fatigue. — It may be assumed that the periods of the school day that are most favorable for mental work should, so far as possible, be devoted to those subjects in which mental application demands the greatest amount of energy. There are two problems, then, to consider: (1) at what periods is energy most readily available for mental application, and (2) what subjects are normally or intrinsically most fatiguing. There are wide differences of opinion

SCHOOL MANAGEMENT

among authorities upon both of these questions, and doubtless wide individual differences among pupils. Much patient experimentation is needed to lay an adequate factual basis for safe generalization. Pending the results of such investigations, however, tentative hypotheses for the guidance of present practice must be drawn from the most trustworthy available data. With regard to the favorable periods, it may be assumed that the morning hours are, for most pupils, somewhat better than the afternoon hours, and that the middle and later parts of each session are more favorable than the earlier parts. In so far as the relative fatiguing influence of various subjects is concerned, the following table may be tentatively accepted. It represents a "composite" of the tables constructed by different investigators in the field of fatigue. The most fatiguing subjects are given an arbitrary fatigue value of 100; the numerals following the other subjects represent approximately their relation to those most fatiguing (See *Fatigue*.)

Formal gymnastics (unaccompanied by music)	100
Mathematics	100
Foreign languages	90
Formal study of mother tongue (including formal composition, spelling, writing, grammar)	90
History	85
Geography	80
Nature study	80
Drawing	60
Singing	40

After the constant or fundamental subjects have been disposed of, the remaining time may be divided among the accessory subjects. It is often possible to arrange for these in such a way that the work demanded may provide a healthful variety of exercises for the pupils. It is also both possible and profitable to emphasize numerous points of "correlation" between different types of school work. Thus drawing and manual training may frequently be linked together, and both should afford opportunity for correlation with arithmetic.

Typical Daily Programs — The teacher who attempts to construct an ideal daily program is face to face with an impossible task unless he is responsible only for a single "grade," undivided into sections or groups. This mode of school organization is to be found in some localities, especially in the larger cities; but even here the present tendency is to divide grades and "rooms" into two or more groups; hence the necessary complication of the program and the consequent impracticability of making it consistent with all of the principles above laid down. As a matter of fact, desirable as it would be to have every exercise at the most favorable period of the day and to give to each subject precisely the proportion of time that its importance, difficulty, and fatiguing power suggest, it is vastly more important to organize the work of the school in such a way that the larger

SCHOOL MANAGEMENT

groups may be split up and ample opportunity and incentive for independent work provided. Program making, therefore, instead of becoming simpler with the congregation of large numbers of pupils in single buildings, still retains many of the difficulties that confronted the teacher in organizing the work of the ungraded, one-room school.

The following programs have reference only to rooms in which two or more classes are organized. They have been selected from various sources and represent typical present practices in the United States. The briefest inspection of them will reveal the fact that each one is inconsistent at some point or points with the principles laid down above. Such inconsistencies are, however, unavoidable in a program for a schoolroom with more than a single class or group.

FROM THE INDIANAPOLIS SCHOOLS (1910);
FIRST-GRADE PROGRAM (THREE GROUPS IN ROOM)

PERIOD	DURATION (MINUTES)	EXERCISE
8:45-9:55	10	Opening exercises
9:55-10:10	15	Reading (Group 3 — beginners)
10:10-10:25	15	Reading (Group 2)
10:25-10:40	15	Reading (Group 1)
10:40-10:50	10	Physical exercises
10:50-11:05	15	Reading (Group 3) †
11:05-11:15	10	Writing (all groups)
11:15-11:30	15	Reading (Group 2) †
11:30-11:45	15	Reading (Group 1) †
11:45-11:55	10	Written or oral spelling (Group 3)
11:55-12:05	10	Drawing (all groups)
12:05-12:15	10	Music (all groups)
12:15-12:30	15	Opening exercises
12:30-12:45	15	Reading (Group 1)
12:45-1:00	15	Reading (Group 3)
1:00-1:15	15	Reading (Group 2)
1:15-1:30	15	Singing, marching, or games — recess
2:00-2:15	15	Reading and writing (Group 1)
2:15-2:30	15	Reading and writing (Group 3)
2:30-2:45	15	Reading (Group 2)

† Formal work in arithmetic is not undertaken in Indianapolis during the first school year. Where "number work" is required, it could be placed at the points indicated.

A THIRD-GRADE PROGRAM FROM THE INDIANAPOLIS SCHOOLS (TWO GROUPS IN THE CLASSROOM — FIRST HALF YEAR AND SECOND HALF YEAR)

PERIOD	DURATION	EXERCISES
8:45-9:55	10	Opening exercises

Absence and Tardiness. — The school habits of regular and prompt attendance are important for two reasons. In the first place, irregular attendance and frequent tardiness disturb the work of the school and the progress of the pupils as a group; consequently unnecessary delinquencies invade the rights of the majority. In the second place, irregularity of attendance is thoroughly inconsistent with the principles upon which modern society, with its highly organized system of industrial cooperation, is based; consequently the school that fails to instill effective habits in these two fields misses an opportunity for impressing a lesson that can easily be generalized and carried over by the pupil into the activities of later life.

There is ample justification, therefore, for the construction that is coming to be placed upon the compulsory attendance laws, namely, that these laws compel attendance on each day during which the school is in session, unless the pupil is detained at home by his own illness or by a very serious misfortune in the family. (See *ATTENDANCE, COMPULSORY*.) In many communities the efficiency of school work is sadly impeded by the failure of parents to take the "business" attitude toward the work of education. Children are kept out of school for trivial reasons, and the written-excuse system, which is practically universal in the United States, is notoriously inadequate as a means of insuring justice. Even where the compulsory attendance is enforced with a reasonable measure of rigidity, there is abundant need for the classroom teacher to consider methods and devices for encouraging regular and prompt attendance.

Two dangers, however, are to be noted in this connection. In the first place, the pupil may, under an unwise system of encouraging attendance, come to regard regularity and punctuality as privileges that he is conferring upon the school rather than as duties which the school may expect from him. The difference in attitude here is fundamental, slight as it may appear to the layman, for the unfortunate attitude has not infrequently been engendered in certain ultra-modern schools, and with disastrous results. The second danger lies in the overzealous endeavor of a principal or teacher to insure a commendable attendance record at any cost. Extreme measures are likely in many cases to impel pupils to attend school when they are physically unfit to do so.

Unfortunately no generally accepted attendance standards have been worked out for the various grades and types of schools. Not only is the teacher handicapped by this lack of definite criteria for determining the efficiency of his efforts to secure regularity and punctuality of attendance, but the situation is still further complicated because of practices in computing the per cent of attendance that are really deceptive. In many

schools, this per cent is determined upon the basis of the average number "belonging." This would not be so unfortunate, were there uniform standards for computing the number of pupils "belonging" to the school. In some schools, pupils are dropped from the rolls after three days' consecutive absence and readmitted upon their return. During the period elapsing between the dropping and the readmission, these pupils do not form part of the school's enrollment, and consequently their absence does not affect the attendance record. In other schools, the pupils are retained on the rolls for five consecutive days and then dropped. In either case, it is clear that the attendance record may appear to be fairly good, while in reality the number of absentees is unusually large. The most practicable way to compute the per cent of attendance is upon the basis of the actual enrollment, deducting only pupils who have removed from the district or who have reached the end of the compulsory education age and have left school permanently. The pupils leaving to enter private and parochial schools should be noted separately. Notations should also indicate general causes for unusual absence. In this way the per cent of attendance will be a fair index of the school's efficiency in securing regularity of attendance. (See *RECORDS AND REPORTS, ATTENDANCE*.)

For the average city or town school it should be possible to maintain a record of from 94 to 98 per cent of attendance without undue pressure. Where this record is not maintained the classroom teacher should look carefully into the causes for the lax attendance. The best teachers are careful to keep informed regarding absent pupils, — not in an obtrusive fashion but as a matter of legitimate personal interest in their pupils. Calling at the homes after school hours or inquiring of brothers, sisters, or neighbors' children will convince the parents that the children are missed from school and stimulate them to do their part in preventing unnecessary absence. A policy of this sort, administered good temperedly, will help, even in schools that are supplied with regularly constituted attendance officers. There are, indeed, indications that the attendance officer will come to be looked upon less as a police official and more as a friendly adviser and counselor.

The control of tardiness is often more difficult than the control of absence. In both cases, the interest that pupils may come to take in the work of the school may be an important factor in insuring a good record and the school efficiency that depends upon regularity and punctuality, but it is the verdict of experience that this factor must operate upon the basis of an attitude that will tend to bring the pupils to school regularly and punctually because the school is there and duty issues the command. This point of

view must be insisted upon or educational disaster is almost inevitable. In the average town or city school, tardiness can be reduced to a minimum of from one to two cases each month for each one hundred pupils. Some schools do even better than this. Habitual tardiness is usually due either to carelessness on the part of parents or to an inadequate judgment of time-intervals on the part of the young child. For the former deficiency, if a courteous explanation of the reasons for demanding promptness is unavailing, the authority of the law should be invoked through an interpretation of the attendance rulings which is thoroughly justified in view of the evil effects of habitual tardiness upon the class as a whole. Where the pupil alone is at fault, coöperation with the parents should be the first measure, this failing, some form of punishment that will associate delinquency with undesirable results is certainly not only justified but demanded for the sake both of the child and of the school.

Order and Discipline.—The fundamental necessity of dealing with individuals in groups or masses carries with it by implication the necessity for the maintenance of order. It is at this point that most of the difficulties in the management of the elementary school are concentrated. The practical experience of schoolmen testifies to the fact that more teachers fail through inability to maintain order than through any other one cause. Luediger and Strayer in their statistical study of the qualities of merit in elementary teachers (*Journal of Educational Psychology*, Vol. I, pp. 272 ff.) show that disciplinary ability is the most important condition of success among the teachers who were included in the investigation. A. C. Boyce in a similar study of high-school teachers finds that, while disciplinary ability does not occupy the first place among qualities of merit, as in the case of elementary teachers, it still remains a factor of fundamental significance.

Certain conditions that now prevail in American education combine with certain social crises to make the problem of school discipline unusually acute. The tendency during the past two decades has been strongly and persistently toward leniency and latitude in those phases of school conduct that were formerly treated rigorously. There has been a pronounced reaction against the repression of individual impulses. The "pin-drop" type of order is now thoroughly taboo in our better schools. Parallel with this development has gone a radical reform in the administration of punishments and penalties and an increasingly insistent demand that the teacher shall secure the ends of good order by positive rather than by negative measures.

There are several factors which have coöperated to produce this reaction. The general tendency in society at large toward a

more adequate recognition of the individual has been one factor. Far more important than this, in America at least, has been the unprecedented increase in wealth and the consequent inevitable loosening of the bonds of individual restraint. This condition has quite transformed the attitude of the people toward rigor in the administration of law, and has naturally been reflected in the current philosophy of school government. Finally, and as the prime immediate cause, stands the almost complete feminization of the teaching force in the elementary and secondary schools, thus delegating the immediate control of pupils to the sex whose tendencies may be looked upon as almost instinctively toward government by appeal rather than toward government by command. A correlative and cooperating factor has been the extreme youth of the teaching body and the readily recognized danger of placing in the hands of immature teachers a large measure of arbitrary authority. Coffman (*The Social Composition of the Teaching Population*, New York, 1911) demonstrates a high degree of probability that more than 50 per cent of the elementary school teachers in American schools are under the age of twenty-four.

The situation with regard to school discipline could be looked upon with less concern were it not for the social crisis that is impending in the United States with reference to the lack of respect for law, order, and authority. The disconcerting and probably unprecedented increase in crimes against the person and against property in the last twenty years, the growth of juvenile crime and "hoodlunism" in our large cities where "soft pedagogy" has taken its strongest hold, the weakening of the moral fiber as revealed in the increase of divorce throughout the country and in the general prevalence of corruption in state and municipal administration,—these unmistakable symptoms indicate clearly a social condition that no student of constructive educational policies can afford to neglect. The general extension of the *laissez-faire* doctrine of school government may or may not be functionally related to the phenomena just noted, this extension has, however, paralleled at every point the loosening tendencies in the body politic, and this concomitance strongly suggests something akin to cause and effect,—especially when one remembers that both the general decadence of the respect for law and order and the parallel changes in school government are very largely limited to this country. Foerster, it is true, has warned the Germans against an analogous danger on the Continent, but, grave as the situation may be in Germany and especially in France, it is far from indicating so serious a crisis as impends to-day in the United States.

The Function of Order and Discipline in Education.—As suggested in a preceding sec-

tion, every measure that school management utilizes must be judged with reference to two possible outcomes: first, its efficiency in securing the immediately desired result, namely, a favorable condition of the operation of other educative forces; and, secondly, its influence as an educative force in itself, leaving with the individual pupil specific habits, working principles, ideals, or attitudes that may be carried over into his later life and become an important factor in determining his conduct. The measures that the school takes to promote what we term good order are of fundamental significance from both points of view. It is through these specifically that the measure of repression which is absolutely essential to effective school work is to be attained, and it is through these indirectly that the basic lessons of self-control, a respect for the rights and feelings of others, the proper attitude toward law and authority and toward work and effort may be indelibly impressed.

The complication of the problem by the operation of the latter factor makes effective discipline extremely difficult. It would be a comparatively simple matter to organize the school upon a military basis; in this way the superficial and external conditions of order and decorum could be adequately fulfilled, but, as has so often been asserted, the more important outcomes which should emanate from discipline as an educative force might easily be missed.

What are the factors that must be considered with reference to these more important outcomes? The problem here involves the troublesome necessity of insuring the transfer of training from the school situation to the situations of "real" life. According to contemporary theory, this transfer is probable under two conditions: first, the presence of identical elements in the two situations; secondly, the command by the individual of a method of procedure that has been abstracted from the matrix of details constituting the first situation and transferred through a process of judgment to other situations, the chances of such transfer being obviously favored by the positive emotional appeal which the method in question may make to the individual, — hence the term "ideal" of procedure. (See FORMAL DISCIPLINE.)

Applying this principle to the problem at issue, it may be concluded that school discipline will be operated to insure efficiency of conduct in later life (1) if the school life is organized upon the plan that characterizes social life in general; and (2) if the virtues represented by the discipline of the school, — obedience to constituted authority, respect for the rights of others, promptness, industry, and duty, — are idealized in the minds of pupils and become, in essence, prejudices or emotionalized standards of conduct.

Recent reforms in school organization have

worked particularly toward the realization of the first condition. They have attempted to make the life of the school correspond much more closely to the life of society than was formerly the case. In the main, this movement has been productive of good results, although in many instances it has quite overshoot the mark; for social life can never give the free play to individual impulse and initiative that some educational reformers have assumed. Its very essence is a compromise between individual desire and the common good. The reform movement has also neglected a very important change that has taken place in social, and especially in industrial, life. The highly complicated organization of industry which characterizes present-day civilization has in effect brought social life into a very close resemblance to school life. The school virtues of obedience, silence, promptness, regularity, and unflinching industry assume a very real significance when thousands of men are working together in a mammoth factory, or upon a highly organized railroad system, or in a specialized department of governmental service. The "common elements" in the school situation and the situations of "real" life are increasing far more rapidly than the differences. And this is natural, for both the school and modern industry deal with individuals not as such, but *en masse*.

In respect of the second condition, the idealization of the school virtues that will make for their transfer even when the situations have few superficial resemblances, one can say but little. Light is needed as to the factors that operate in the construction of effective ideals and attitudes. It is safe to assume, however, that the desirable virtues must be woven into the very fabric of the school life, if they are to become effective ideals. The ability to make the necessary abstractions, — to raise the virtues to the conceptual plane, — undoubtedly increases with age. One cannot expect very much from explicit moralizing in the lower grades, but with the older pupils an attempt should certainly be made to reveal the absolute necessity of the types of conduct that are demanded. To this end it is, of course, important that requirements should be justified by their necessity to the general efficiency of school work. At the same time it should not be an impossible task to teach adolescents the need for unyielding standards, for living up to rules that are necessary in the majority of social adjustments, even if their necessity is not apparent in this or that particular instance. To permit exceptions to occur in the application of standards is to open the paths of least resistance, and the individual himself is usually the last person who should decide whether a lapse is justified by the common good.

A Recognition of the Authority of the Teacher

the First Condition of Effective School Government — This recognition is a function of at least three factors, each of which may operate independently of the others. (a) The personality of the teacher is obviously of first importance. The attitude of the teacher toward his work and his feeling of responsibility for the government of his pupils are those elements in the generally unanalyzed complex called "personality" that are usually at fault when disciplinary troubles become serious. Given this feeling of responsibility for adequate results and for the good order that is both a condition of such results and an ingredient in them, and the teacher can scarcely escape an effective personal interest in and sympathy with his young charges. Without this seriousness of purpose and this interest and sympathy, the authority which law and public sentiment may delegate to the teacher is quite as likely to work evil as to work good, without the authority, however, and the recognition of the authority by parents and children, the responsibility becomes a word without a meaning and the sympathy and interest are shorn of half their power. Given both the requisite authority and the requisite sympathy, interest, and feeling of responsibility, success in discipline depends, from the point of view of the teacher's personality, upon (1) studious patience, (2) courage, (3) tact (especially in dealing with hypersensitive pupils and with parents), and (4) thoroughgoing self-control. To these may be added, as explaining by their lack the failure of many teachers, a good voice, a good governing "eye," and what may be (rather vaguely) termed a sense of order. It is obvious that most of these factors are amenable to development through the discipline of experience, and this probably explains why so many teachers who either fail or succeed but indifferently at the outset become thoroughly expert in the course of time.

(b) A second factor in the effective recognition of the teacher's authority is involved in the traditions of the school. It is sufficient to say in this connection that a school which has been started wrong or in which general disorder has been permitted to prevail may offer almost insuperable difficulties to the success of the young teacher. The principal of the school is usually the responsible agent in a situation of this sort.

(c) The third factor is represented by the attitude of the community toward the work and government of the school. It is a much simpler task for the German teacher to secure from public-school pupils a maximum of effort than it is for the American teacher. The attitude of the pupils is more uniformly favorable to obedience, favorable to putting forth effort in the direction that the teacher suggests. Where this attitude is not taken for granted, the difficulty of the teacher's

task becomes immeasurably increased. It is, therefore, a fundamental principle of school management that the teacher be given sufficient power to insure, other things being favorable, an adequate attitude upon the part of the pupils toward his authority. In communities where public opinion is unfavorable to this attitude the position of the teacher often becomes intolerable.

Penalties and Rewards — Every system of government which effectively establishes and maintains its authority must provide penalties for those individuals who fail to recognize this authority. Prisons, reformatories, and the machinery of criminal law are essential to the protection of the majority and the maintenance of the common good. Every form of coöperative society demands the repression by the individual of impulses which, "natural" though they may be, are inconsistent with social welfare and social progress. School government is no exception to this rule.

In the early development of formal education the chief penalty employed was corporal punishment in one form or another. Within the past half century the rod of correction has been used with decreasing frequency, and the present tendency in American education is to banish it entirely. It is generally agreed that the movement away from corporal punishment has been beneficial. Whether it has swung too far is still an open question. The rod is the symbol of a type of school management which was characterized by a rigorous insistence upon standards and by the belief that the immature child could not be depended upon to judge wisely as to the course that he should pursue. In other words, it recognized the principle of *compulsion* as opposed to the principle of individual initiative. The reaction which has swept aside the rod as the specific symbol of this doctrine has tended to carry with it the doctrine itself. And thus, in the writer's opinion, is where the present difficulty and the impending danger are concentrated. (See PUNISHMENT, COMPULSION.)

The reaction against corporal punishment has been paralleled by the development of agencies which have, in some measure, fulfilled the function that the rod fulfilled in the old-time schools. In some communities, elaborate systems of monitorial service have been developed, such service being regarded by the pupil as a privilege and thus lending itself readily to employment as a reward either for orderly behavior or for meritorious effort. Detaining pupils after school hours and depriving them of recesses are representative penalties through which the ends of good order and faithful work are attempted. Devices unnumbered have been suggested to give to the teacher an effective control over the conduct of the children for which he is responsible. Spencer's theory of "natural punishments" has been repeatedly urged as a basis for school

management in spite of its fallacies (Cf. a discussion of this theory in Colgrove, *The Teacher and the School*, New York, 1911, pp. 387 ff., and in the writer's *Classroom Management*, New York, 1907, pp. 106 ff.) The doctrine of "substitution" has been proposed to take the place of the older doctrine of "repression," upon the theory that, if healthful channels for the expenditure of the child's excess energy be provided in sufficient number, the undesirable expressions will not be forthcoming. Finally, as a natural consequence of the emphasis upon self-activity and individual initiative, some schools have gone to the extreme of *laissez-faire* and have made every form of repression taboo, thereby reducing the school life to a condition that, in a few cases, must be condemned as nothing short of anarchy. (See PUNISHMENTS AND REWARDS.)

In general, it may be said that in America the employment of penalties in school management has been restricted and discouraged. Detaining the pupil after school hours and depriving him of recesses are both generally looked upon as bad practice. "Scoldings" and rebukes are also frowned upon, and in the main the policy here is a wise one. The use of school tasks as penalties (the writing of words or the working of arithmetical problems in large numbers simply as a punishment) is obviously poor practice because it places the pupil in the wrong attitude toward school work. On the positive side, also, the granting of material prizes for good order or for good work is condemned. For stimulating the pupil to effort and for insuring his orderly behavior, therefore, the teacher must, according to current accepted standards, depend very largely upon his personal appeal and upon the general attitude of the community toward the work of the school. The latter factor, as has been pointed out, does not operate so uniformly in his favor as could be desired, and, in general, it may be concluded that he must depend primarily upon the personal element, if he is to do his work conformably with accepted standards of management.

It is obvious, however, that the standards, while representing ideal conditions, are quite inconsistent with a satisfactory solution of the situation which the average teacher confronts. The natural result is evasion, more or less unpremeditated, perhaps almost unconscious, but none the less disastrous. A recognition of the extent of this evasion, if the facts could only be known, would doubtless awaken the public to the utterly impracticable situation which confronts the teacher in those schools that are extreme in their insistence upon nonrepressive disciplinary measures.

The first and most important precept for the teacher to bear in mind in solving problems of discipline is to deal with individuals and to recognize individual needs in every corrective measure that is applied. It is because of

the failure to recognize this principle that many of the disciplinary measures undertaken by young teachers work so disastrously. They attempt to punish the group for the shortcomings of the individual, they scold and threaten the entire class instead of singling out the offenders and treating them individually.

But individual treatment means something more than a general method of procedure applied to a single individual. It means selecting the type of treatment that will be best adapted to the case in question. Some pupils will be effectively corrected by the simplest sort of reminder, others will need a sharp rebuke, still others will be won by the evidences of the teacher's sympathy with and interest in them, some can be best turned from a wrong course by enlisting the cooperation of the parents, a few there will still remain that must be forced into submission by the mere preponderance of physical strength. It is fatal not to recognize these types and carefully to study each individual to determine the most effective method of dealing with him in each instance.

A second condition of effective discipline is the feeling upon the part of the teacher that he is secure in his authority, that his position will be supported by all of the power which the state can command, if this is needed to support him. It is in this consciousness of power that effective courage lies. To surrender to the whims of pupils, to let them have the consciousness of having conquered, is fatal. It defeats the two ends for which disciplinary measures exist, for it means anarchy in the classroom and it means a distorted perspective upon the part of the child toward the great problem of living amicably and helpfully with his fellows. When reasonable rules for the welfare of the mass can be overridden at will by the immature pupil in the schools, the seeds of that lawlessness which now forms so serious a social problem in this country are being scattered broadcast.

This suggests a third condition, persistence in the problem of discipline until it has been satisfactorily solved. The teacher must come to take toward the serious cases of discipline the same attitude of studious patience that the physician takes toward a serious case of illness. Refractory pupils are just as inevitable as refractory diseases, and it is entirely within the realm of possibility that our school system will sooner or later develop its staff of consulting experts to advise with classroom teachers regarding the best methods of solving these troublesome problems.

The relations between the school and the home are often important factors in disciplinary management. In systems that have narrowly limited the power of the classroom teacher, an attempt has been made to hold the parent responsible for the misdeeds of his

children, and to secure a proper respect for the authority of the teacher through the medium of parental authority. (Cf. J. S. Taylor, *Class Management*, New York, 1908, p. 70.) While the cooperation of home and school should be encouraged here as elsewhere, it is questionable whether the teacher should surrender the principle implied in the phrase *in loco parentis*. The future efficiency of the teaching profession may be at stake here. Responsibility without commensurate authority is a word without a meaning, and where one's authority becomes hedged about by impracticable restrictions it soon comes to be, in effect, a dead letter (See FAMILY EDUCATION; PARENTS AND SCHOOLS; SCHOOLS AS A SOCIAL CENTER.)

We have already referred to the grave danger of evasion by the teacher of impracticable rulings that limit his authority. Another danger, perhaps equally serious, should be noted. It is easy to follow the lines of least resistance in discipline, to fail to note and correct lapses from reasonable requirements because of the tedious procedure that one must take in order to act consistently with unreasonable restrictive rulings. Thus young teachers are likely to permit such lapses to continue until inept disorder and disrespect for authority have become chronic. It is this condition which renders quite ineffective certain doctrines of school management that appeal to the layman as thoroughly practicable.

When so many of the teachers in our public schools are young girls, themselves just out of school, with their native feminine tendencies toward leniency intensified by the long years during which they themselves have been pupils and students, and confirmed by the sentimental attitude which the instruction given in teachers' institutes so often encourages, the chances are that a good many children will be "spoiled" (in the domestic sense of this term). The danger to society which this condition involves is clearly apparent, and against this danger a doctrine of school management that is to be effective must sedulously guard, even if it seems to overemphasize certain factors that were characteristic of the older type of school government.

Pupil Self-government.—Numerous attempts have been made to solve some of the troublesome problems of school discipline by developing self-governing organizations among the pupils. These experiments have been suggested by the excellent results which have followed from delegating a measurable degree of initiative and responsibility for school government to the older pupils in the English secondary (boarding) schools, and also by the unquestioned success of "self-governing" institutions for waifs, of which the George Junior Republic at Freeville, N.Y. (*q.v.*), is the most conspicuous example. The experi-

ments in public elementary and secondary schools in the United States have not been altogether successful, although most of these experiments have started out encouragingly. In any case, it is clear that the organization of a self-governing community among the pupils, while it may result in the effective acquisition of some important civic lessons, will not relieve the teacher of his responsibility for ensuring the welfare of the mass. It is probable that such machinery, once set in motion and then neglected by those in responsible authority, would tend to reflect the evil phases of adult self-government much more faithfully than the good phases. (See PREFECT; SELF-GOVERNMENT.) W. C. D.

SCHOOL ORDERS—A term sometimes used for written or printed instructions sent out to teachers, but much more generally used to mean warrants, or drafts, or checks, drawn on the school funds by district boards of trustees (*q.v.*), boards of school directors, or the executive officers of boards of education, in payment of supplies or material furnished, or for labor performed for the school district drawing the same. When school funds are handled by the school boards locally, the orders are drawn on the treasurer of the district, when all school district funds are retained by the county treasurer, as is the case in many Western states, the orders are drawn on the county treasurer. They are used and passed, by endorsement, in the same way as bank checks. E. P. C.

SCHOOL ORGANIZATION AND ADMINISTRATION—This topic has been treated in a large number of detailed articles, to which the reader is here referred. The topic is very comprehensive, and may be subdivided

SCHOOL ORGANIZATION

into state, county, city, and district organization and administration.

For articles on state school organization and administration the reader is referred to the following NATIONAL GOVERNMENT AND EDUCATION and CONSTITUTIONAL PROVISIONS RELATING TO EDUCATION deal with the relation of national to state school organization and administration. APPORTIONMENT OF SCHOOL FUNDS, SCHOOL FUNDS; SCHOOL FUND COMMISSIONERS; and TAXATION FOR EDUCATION deal with the financial aspect of state organization and administration. ATTENDANCE, COMPULSORY; CENSUS, SCHOOL; CHILD LABOR; CHILDHOOD, LEGISLATION FOR THE CONSERVATION AND PROTECTION OF, and PARENTS AND SCHOOLS deal with the care and protection of the child on the part of the state. STATE AND COMMUNITY; STATE SCHOOL ADMINISTRATION; SCHOOL LAWS AND DECISIONS, and PUPILS' RIGHTS, DUTIES, AND OBLIGATIONS deal with the state in its relation to localities and individuals. PAROCHIAL SCHOOL SYSTEM; PRIVATE SCHOOLS; and STATE vs PRIVATE EDUCATION deal with the relation of the state to extra-state educational endeavor. SCHOOL BOARDS; STATE BOARDS OF EDUCATION, SCHOOL SYSTEMS; SUPERINTENDENTS OF SCHOOLS, and SUPERVISORS AND INSPECTORS deal with the forms of organization for state school administration. COURSES OF STUDY; SUPPLIES, SCHOOL, TEXTBOOKS; and SUPPLEMENTAL BOOKS deal with state and local legislation on these topics. CERTIFICATION OF TEACHERS; EXAMINERS, BOARDS OF; READING CIRCLES; TEACHERS, TENURE OF; and TEACHERS IN SERVICE, EXAMINATION AND TRAINING OF deal with the relations of the state to the teaching force. The articles on the history and present school systems of the different American states, ALABAMA, CALIFORNIA, NEW JERSEY, etc. (*q.v.*), give in detail the form of school organization and administration for each state.

For articles dealing with the county organization and administration, the reader is referred to CERTIFICATION OF TEACHERS; CONVENTIONS, SCHOOL BOARD, COUNTY BOARDS OF EDUCATION; COUNTY SYSTEM OF ADMINISTRATION, HIGH SCHOOLS, COUNTY; INSTITUTES, TEACHERS'; NORMAL SCHOOLS; RURAL SCHOOL SUPERVISION, and SUPERINTENDENTS OF SCHOOLS.

For articles dealing with city school organization and administration, the reader is referred to BUDGET, SCHOOL; BUSINESS MANAGEMENT AND MANAGER, CITY SCHOOL ADMINISTRATION; CITY SCHOOLS, LOCAL BOARDS; COURSES OF STUDY, GRADING AND PROMOTION; STATE AND COMMUNITY; SUPERINTENDENTS OF SCHOOLS; SUPERVISORS AND INSPECTORS; SPECIAL TEACHERS; TEACHERS, TENURE OF; TEACHERS, TRAINING OF.

For articles dealing with district or rural

SCHOOL SOCIETIES

school organization and administration, the reader is referred to CONSOLIDATION OF SCHOOLS, CONVENTIONS, SCHOOL BOARD, COUNTY SYSTEM OF ADMINISTRATION; COURSES OF STUDY; DISTRICT SYSTEM; DISTRICT MEETING; DISTRICT BOARDS OF TRUSTEES, PUPILS' RIGHTS, DUTIES, AND OBLIGATIONS, RURAL SCHOOLS, RURAL SCHOOL PROBLEM, RURAL SCHOOL SUPERVISION; SUPERINTENDENT OF SCHOOLS; and TOWNSHIP SYSTEM. E. P. C.

For school administration in all other countries, see the articles on the respective countries.

SCHOOL SYSTEMS, TYPES OF. — The school systems of the world may be classed as national, state, county, or local, according to the plan of organization and the degree of control exercised by the central authority. Among the different so-called national school systems, some are real national systems and others are national only in spirit. The school systems of France and Italy (*q.v.*), for example, are real national school systems, the power of control exercised by the central authorities at Paris and Rome being very large. The school systems of Australia (*q.v.*) or Germany (*q.v.*), though almost equally centralized in the different states, are not national school systems at all, but a series of highly centralized state school systems. The school system of Prussia differs somewhat from that of Bavaria, Saxony, or Württemberg, as do also the school systems of Victoria, Queensland, or New South Wales, from one another, though naturally there are many national similarities. Each state is left free to carry out its school system as it deems best, though within each state a large degree of central control is exercised. In Canada (*q.v.*) and the United States (*q.v.*) the school systems are also regarded as state school systems, being national only in spirit, but in each of these countries the degree of state centralization and control is much less than in such states as Prussia or New South Wales. A greater degree of centralization exists within the different Canadian states than is the case in most of the American states. (See CANADA, EDUCATION IN, and UNITED STATES, EDUCATION IN, for a more detailed statement of the systems of school organization for the two countries.)

Below the national are the state school systems, which vary greatly in the degree of centralization and control. The Prussian, the New South Wales, the Nevada, and the New York

SCHOOL UNIONS

State school system (*q.v.*) are examples of highly centralized state school systems, the state minister or commissioner or superintendent for education possessing large and authoritative powers. The state school systems of Ontario, Maryland, and Indiana (*q.v.*) represent school systems less centralized than those just named, and in these the state and the locality divide the authority and the responsibility in differing degrees. The state school systems of Switzerland (*q.v.*) and Oregon (*q.v.*), on the other hand, are but loosely organized cantonal or county school systems, the canton or the county being the real unit of educational organization and support, while the state oversight and control is weak. The state school systems of Ohio, Missouri, and Arkansas (*q.v.*), represent a still further subdivision of authority, the school systems in these states being state school systems only in name, while in effect they are series of small local school systems, — township in Ohio, and district in Missouri and Arkansas, — loosely knit together under either county or state authority. E. P. C.

SCHOOL TRUSTEE. — See DISTRICT BOARDS OF TRUSTEES.

SCHOOL UNIONS. — By this term is meant the joining of two or more school units, such as districts, townships, towns, etc., for some educational purpose, such as the maintenance of a union school, or a high school, or the employment of a superintendent of schools. Such unions are permitted in most states. The union school idea is an old one, its use being to enable the union of districts to provide what the districts individually could not provide. The union free school of New York, first established in 1853, was of this type. This law provided that any union of two or more districts might be organized for the purpose of providing free schools and the levying of taxes for the same. Its use to-day is for the same general purpose. The California law, permitting two or more districts to unite to maintain a union elementary graded school or a union high school, each district contributing to the cost of maintenance in proportion to its assessed valuation, and each having representation on the union school board of trustees; the Ohio law, per-

SCHOOL UTENSILS

mitting two or more townships to unite in the maintenance of a union township high school, and the Massachusetts law, permitting two or more towns to unite in the employment of a union superintendent of schools, are examples of such laws. The county high school laws common in the western states virtually provide for the organization of a union of all the elementary school districts of the county to maintain a county or union high school district. Again, two or more school districts, otherwise independent, may unite in the maintenance of a parental school, or in the employment of an attendance officer. Joint unions mean that the districts uniting are under the jurisdiction of more than one county school officer or board. A high school, for example, might be formed by the union of three school districts, each in a different county, and the school thus formed would be under the joint control, so far as formation, census, finance, and yearly reports, at least, were concerned, of three different county superintendents of schools, or three different county boards of education. In most states it is customary to give the immediate supervision of the school to the school officer in whose county the school is located. E P C.

SCHOPENHAUER, ARTHUR (1788-1860). — The German philosopher, was born

VOL. V — U

SCHOPENHAUER

in Danzig, Feb 22, 1788, and died in Frankfurt, Sept 23, 1860. At Gottingen he began a diligent study of "Plato the divine and the marvellous Kant," both of whom gave shape to his philosophy. He also came under the influence of G. E. Schulze, Fichte, Schleiermacher, and Wolf, the classicist, and later of F. Mayer, the orientalist. Schopenhauer's career was uneventful, marked only by his failure as a university lecturer at Berlin (1820). He devoted himself to the tasks of authorship in expounding his metaphysical and ethical principles, and was destined to a long, impatient waiting for belated renown as a philosopher. Bearing the hereditary seeds of a mental malady and suffering from the strong temperamental differences of his parents, he exhibited a conspicuous personality, distorted by unsatisfied yearnings and a special capacity for sensing pain. His pessimism is an instance of the close connection that exists between the individual experiences of a thinker and his philosophy.

In his chief work, *The World as Will and Idea* (1818, Engl. tr 1883), Schopenhauer presents what he claims to be the true and final development of the critical philosophy of Kant. He articulates epistemology, metaphysics, art, and ethics into a hundred-gated system. The world of experience is only "my idea." Science, being only an expression of intellect, leads us astray from philosophical truth. The reality behind appearances and ideas is blind, unconscious, universal Will, — the feelings and desires in all forms of existence ever struggling to self-assertion and never being satisfied. This thing-in-itself is identical in nature and humanity, in body and will. As a metaphysical power it objectifies itself in inorganic and organic nature, reaching its apex in the human brain, where it comes to intellectual and moral consciousness. In its struggle for existence, will induces inevitable and necessary suffering, from which there are only two modes of release. Man may find unity with all things through the forms of art, where the observer transcends all individuality and beholds the Ideas as the eternal forms of Will. The aim of morality is to lead man to deny the will-to-live, and thus escape pain as the price of existence, until the unconsciousness of absolute negation is reached. His other important writings, *Will in Nature* (1836) and *Parerga and Paralipomena* (1851), are collections of observations on his main thesis of the primacy of Will, or applications of his pessimism to the affairs of human life. His philosophy attracted no attention until toward 1850.

Education presented a field in which Schopenhauer had a lively interest. Without systematizing his conclusions, he scatters his observations on training children and youth and makes application of his philosophical principles in his main work and in a number

of essays, such as *Education* (in *Studies in Pessimism*), *Thinking for Oneself*, *The Study of Latin*, *Men of Learning*, *Authorship and Style* (in *The Art of Literature*), all translated by T. D. Saunders.

Schopenhauer's metaphysics of will and ethical pessimism preclude the possibility of education in any real sense of the word. Character is born with a person, and is therefore unalterable. With the unchangeableness of the characteristics of will, education cannot hope to lessen suffering, much less bring in happiness. There is no evidence of progress in history, and the bulk of mankind is regarded as indifferent and the plaything of impersonal forces. To such views there can be no justification of education, positive belief in which is directly based on a keen interest in the intrinsic worth of humanity and on a recognition of its capacity for development. His ideals of art, self-negation, and philosophy provide no room for the aim of education conceived by those who take an ethical view of the process, or who regard mind as resulting from educative forces.

On the other hand, Schopenhauer's view of education is consistent with his philosophy. Since education touches only the intellectual, and not the volitional, functions, it is restricted to phenomenal experience. Its limits are fixed by inheritance in both intellect and will. It is possible in childhood, because then the cerebral and nervous system preponderate, and consequently intellect is more in evidence, will being held in check until puberty. "The mental powers develop much earlier than the needs they are destined to serve," and consequently "children are so sensible, reasonable, desirous of information and teachable, and are more disposed and fitted for all theoretical occupations than grown-up people (*World as Will and Idea*, ch. 31). The end of education is "to acquire a knowledge of the world." This was the kind of education given him by his father, and it is in agreement with his inductive procedure in philosophizing. The chief question in education accordingly becomes that of the method of teaching which shall produce adequate knowledge, and he adopts for guidance a principal conclusion in his epistemology (*Ibid.*, Bk. I, §§ 8, 9). Concepts always presuppose things, and arise by abstraction out of intuitions or perceptions, which come first in the order of time. This is the character of natural education, as shown by the fact that experience teaches directly. Artificial education, which allows the mind to become filled with concepts gathered from reading or through improper teaching before there is any acquaintance with the appropriate part of the sense-world, leads to error in knowledge and action and produces distorted and perverted beings. In thus demanding the use of the methods of truth in education, he is in general agreement with the pedagogy of Locke,

Rousseau, and others. Up to the sixteenth year of age, perception and memory are the cognitive functions to be exercised. The youth is to be persistently engaged in collecting facts in the fields of mathematics, language, natural science, and history. The current practices in education, which import "finished" thoughts into the child's mind, he severely condemns because they are a permanent source of prejudice and error. On this ground is condemned also the early teaching of philosophy, religion, and general views of every kind. The unreal fantasies of most novels make the reading of them by children bad. Selected biographies offer much better material for teaching. The logical subjects have little educative value. Geometry should be taught by immediate perception, and not by the reasoning Euclid introduced. By his high regard for the classical literature of Greece and Rome as the best expressions of humanity, and his contempt for patriotism in national letters and science, Schopenhauer became a neo-humanist. Acquaintance with many languages, Latin being the chief, is a direct means of mental culture. His conviction as to the positive value of the classics was so strong as to lead him to prophesy that, should they cease to be taught (as was then threatening), "the age of barbarism will return, in spite of railways, telegraphs, and balloons."

The direct application of pessimism appears in his denial of so-called moral education. Direct will training is impossible, for character is fixed. Action may be affected indirectly by changing or improving motives through the channels of organized or widened knowledge. The hope of advancing a pupil's morality by teaching him that the maxims of right and virtue are usually followed, is false. When he later discovers the deception, his own morality will suffer. Instead it is better to teach the child: "Humanity is bad, but you should be better." Schopenhauer also distrusted the apparent evidences of education in society. The many different kinds of schools create the impression that the race is very much concerned about insight and truth. He believed, however, that the great majority taught and learned "only to earn money." He was venomous toward the university faculties, and especially toward their attempts to teach philosophy. His failure to succeed as a *privat-docent* at Berlin he attributed to the intrigues of his colleagues. The prize essay on his system of philosophy, accepted by the University of Leipzig in 1856, let his fury loose again. "He who holds a professorship may be said to receive his food in the stall; and this is the best way with ruminant animals."

SCHULZE, JOHANNES (1786-1809).—

One of the founders of the present system of higher education in Prussia, was born at Brühl, a town in Mecklenburg, studied theology and philology at Halle, where he came under the influence of Schleiermacher (*q.v.*) and F. A. Wolf (*q.v.*), then at Leipzig, where he attended the lectures of the great classicist Gottfried Hermann. In 1808 he was appointed professor of the gymnasium at Weimar, and in 1812, professor of the gymnasium at Hanau. In 1815 he entered the Prussian service as school superintendent (Schulrat) in Koblenz. In 1818 he was called to Berlin by Altenstein (*q.v.*) as counselor in the newly founded ministry of education. In this position for forty years he greatly affected the development of the Prussian higher schools and universities.

His most important work was with regard to the course of study in the gymnasium and the preparation of its teachers. He retired in 1858. He published a collection of his *School Addresses* (*Schulreden*, Leipzig, 1810-1830, 2 vols.), an edition (together with H. Meyer) of Winckelmann's *History of Ancient Art* (Dresden, 1809-1815, 4 vols.), and of Hegel's *Phenomenology of the Mind* (Berlin, 1841). F. M.

SCHUPP, JOHANN BALTHASAR (SCHUPPIUS) (1610-1661).—A German preacher and satirist. He was born in Giessen, and, until the age of nineteen, studied philosophy and theology at the University of Marburg. In accordance with the custom of the times, he then set out on a journey on foot through the greater part of Germany, the Baltic provinces, Denmark, and Poland, undergoing various adventures in those troubled times of the Thirty Years' War, studying everywhere the life of the people, and stopping at various universities to enlarge his knowledge of the-

SCHWARZ

ology. In 1632 he began to lecture in Marburg, but interrupted this work to undertake a journey to Holland, where he studied at the University of Leyden. In 1635 he was appointed professor of history at Marburg and taught there until 1640, when he accepted a position as court preacher to the Count Johann of Hessen-Rheinstein at Branhach. In 1649 he was called to Hamburg as pastor of St Jacob's church, and died there at the age of fifty-one years.

Schupp belongs to the best German prose writers of his time. In his many pamphlets and sermons he vigorously attacked the foibles and vices of his contemporaries. He advocated a reform of the schools, insisting on the study of the mother tongue and on the restriction of the time given to Latin. He also demanded a better financial status of teachers, and declared that there would be no good schools in Germany until teaching was entirely separated from the clerical profession, — a thought which was about two centuries ahead of his age. F. M.

SCHWARZ, FRIEDRICH HEINRICH CHRISTIAN (1776-1857).—

German theologian and educationalist, born and educated at Giessen, in both the Latin school and the university. For a time he was a Lutheran minister, but in 1804 he was appointed professor of theology at Heidelberg, the first Lutheran professor at that university. Schwarz always took a particular interest in education; he assisted in the direction of a philosophical-pedagogical seminar, was inspector of schools and churches, and for a time principal of a private school at Dexbach. As a student of education he was well-informed on the current theories of his day and in his works aimed to reconcile the naturalistic with the theological attitude to education, adopted Pestalozzi's methods and theory as to sense-perception and harmonious development and Herbart's view of the educative aim of instruction. His many educational writings include: *Grundriss einer Theorie der Mädchen-erziehung in Hinsicht auf die mittleren Stände* (1792); *Erziehungslehre*, 4 vols. (1802-1813); *Lehrbuch der Erziehungs- und Unterrichtslehre* (1805); *Gebrauch der pestalozzischen Lehrbücher beim häuslichen Unterricht* (1804); *Die Schule* (1832); *Darstellung aus dem Gebiete der Pädagogik*; and a number of books on moral and religious instruction. He also edited the *Freimütige Jahrbücher zur Verbesserung des Volksschulwesens*. An important contribution was made by Schwarz to the study of the

History of education, which he issued in 1813 with the title, *Erziehungslehre*. (See HISTORY OF EDUCATION.)

SCIENTIFIC METHOD -- Science and Education -- The term science in the sense of knowledge (*scientia*) was long used to include the entire subject matter of study. (See KNOWLEDGE.) During the last two or three centuries the term has been commonly restricted to one of two senses: first as a general method of organization or investigation applicable to the phenomena of almost any field, second, as a term to include the various aspects of the study of natural phenomena; that is, natural science. The first aspect of the term is discussed under the captions EXPERIMENTATION, HYPOTHESES, INDUCTION AND DEDUCTION, LOGIC, etc. (*qq v*). Even in the second aspect of the term, the sciences form too large a part of modern education to be discussed adequately in one article. The historical development, the present place of the sciences in education, their scope and method are therefore presented in this work under the following captions: AGRICULTURE, ASTRONOMY, BOTANY, GEOGRAPHY, GEOLOGY, HYGIENE, NATURE STUDY, PHYSIOLOGY, PHYSICS, SANITARY SCIENCE, ZOOLOGY, etc. The applied aspects of these subjects are treated in the articles dealing with the various aspects of professional and technical education, for these see AGRICULTURAL EDUCATION; INDUSTRIAL EDUCATION; MEDICAL EDUCATION; PHARMACEUTICAL EDUCATION; PHYSICAL EDUCATION, SANITARY SCIENCE, EDUCATION IN.

Philosophical Concept of Science and Scientific Method. -- Science is usually defined as systematized knowledge. The definition, while correct as far as it goes, is incomplete. Everyday knowledge, the knowledge held in solution in "common sense," is systematized. It is not a casual heap of disconnected scraps. The bonds of union and the principles of arrangement in such knowledge are mainly practical and social. The knowledge is ordered, but it is not ordered from the standpoint of and for the sake of knowledge. Not, then, the presence of systematization characterizes science, but the presence of a peculiar principle and method of systematizing. Science is knowledge systematized from the standpoint of and for the sake of knowledge, as distinct

from the standpoint of practice and social intercourse. Specifically this means that the subject matter of knowledge is (a) selected, (b) formulated, and (c) arranged with special reference to the exhibition of the relations of intellectual dependence which its various parts sustain to one another. A typesetter will specify and arrange his knowledge of letters with reference to their effective use in his calling. The letters will be arranged (systematized) in his case with the same reference to convenience of use. A scientific treatment considers them as vowels and consonants, and subdivides vowels and consonants with a view to exhibiting principles of unity and of graded diversification among them.

Further analysis shows that the arrangement which brings to light relation of intellectual interdependence is one which is concerned with the subject matter from the standpoint of premiss and conclusion in inference. That is to say that a scientific systematization of subject matter means the subject matter is organized so as to promote the easy passage of thought from any position to any other through logical inference. The material is selected and disposed so that one part is a logical conclusion from other parts, while in turn it serves as a premiss from which, in combination with other parts, still further conclusions may be drawn. Moreover this premiss-conclusion relation is two-sided. On the one hand, it is concerned with proof or testing. Certain considerations in the subject matter may be resorted to in order to guarantee or justify certain other propositions. On the other hand, it has to do with facilitating the inferring of new conclusions, or the promoting of discovery. In any given science we attempt to state our knowledge in such form that it will answer both of these requirements, so that we may test any given proposition by noting whether and how it follows from other propositions taken as established, and also may utilize given propositions to arrive at others not previously known. The processes of obtaining data (or evidence), of definition (or fixation of meaning), of generalization (or reduction to principles), and of classification (or graded grouping) characteristic of any science, are the means taken to satisfy these requirements.

The conception of science derived from emphasizing the method which yields systematization, instead of testing in the mere fact of the accomplished system, has important educational consequences. What is taught as science is often nothing more than a peculiar or technical body of information (*q.v.*). Externally speaking, it is science. That is, at some time it was actually reached by processes of reflective inquiry conforming to the general canons just mentioned. Moreover, it is labeled science in the educational scheme. But in so far as the pupil is unaware of the

SCIENTIFIC METHOD

processes of reflective thought which give the information its characteristic scientific status, it has no real right to the title of science, and in so far as he does not himself go through these processes and thereby take an active part in performing the specific logical processes that transform the body of facts and laws into a science, there is no genuine study of science. There is merely the acquisition of a certain bulk of externally communicated information, information which is, indeed, distinctive in its technical terminology, but which for that very reason is more remote from any actual thinking on his own part than acquired information of a more familiar sort.

It may be seriously questioned whether these considerations do not throw light upon the failure of much science teaching to realize the expectations of those who have been especially urgent in securing the introduction of science into the curriculum. When science is taught as so much ready-made subject matter, instead of as a subject matter in process of making, by means of the mastery and use of certain methods of inquiry and reflection, there is no more reason to expect results of intellectual enlightenment or practical utility than in the case of memorizing a collection of nonscientific material. While the introduction of laboratory equipment and the use of experiment and observation furnishes, of course, one indispensable factor in the teaching of science as method, it does not of itself meet the entire need. It is possible for students to gain facility in the manipulation of materials and apparatus without gaining an insight into the significance of what is done from the standpoint of its role in genuine thinking, or the making of valid knowledge. As long as the ideal of the acquisition of information persists as the dominant ideal, so long the salient value of science for educational purposes, the mastery of the most effective methods of thinking and their translation into personal attitudes and habits will be obscured or ignored.

When science is approached from the standpoint of method, it is obvious that no absolutely new operations are involved in it. It does not depart from the factors employed in the reflective examination of any topic (see PROBLEM; HYPOTHESIS; EXPERIMENT; also METHOD and INDUCTION) so far as introducing new operations is concerned, but only by supplying the conditions of increased control and care under which to carry on these operations. If scientific methods depaupered essentially from the methods of reflection and deliberation employed in the daily affairs of life, education in them would be of comparatively little avail outside of the specialized pursuit of a science. But since they present a purification and intensification of the usual methods through making precise and adequate the conditions that enter into their use, proper

SCIENTIFIC SOCIETIES

teaching of scientific method affords the most effective of all agencies for correcting, extending, and confirming the habits of reflection indispensable to a cultivated and useful life. This proper teaching, in addition to the emphasis upon intellectual method already considered, demands that the growth of scientific problems out of the situations of everyday life be taken into account, instead of plunging at once into the technical scientific material without a modulated transition, and that pains be taken to insure application of scientific results to the interpretation of everyday situations. J. D.

SCIENTIFIC PEDAGOGY. — See EXPERIMENT IN EDUCATION; PSYCHOLOGY, EDUCATIONAL, also TESTS, CHILD STUDY

SCIENTIFIC SOCIETIES — Organizations of persons associating together for mutual interchange of ideas and the advancement of either science in general or some special branch. Historically such societies were general in character, as might be expected from the limited range of scientific knowledge. Their development is almost parallel with that of academies (*qv*), a term generally but not always reserved for societies for the promotion of learning in other fields than science. While scientific societies are found springing up here and there in Europe in the seventeenth century, their multiplication and further development belong to the latter part of the eighteenth and the whole of the nineteenth centuries. As the different departments of scientific knowledge increased in scope and became more and more specialized, branches were split off from the older and more general societies or entirely new organizations were formed. But the very increase and specialization led to the need of some organization of a general character and wider scope, national or international, which would offer a common meeting place for the more scattered branches and unite scholars for the promotion of science in general. Hence there arose societies like the British Association and the American Association, each with its twelve sections. Side by side with the societies for scientific inquiry, there also arose in the last century societies for the study of the applied professional branches, such as medicine, industrial chemistry, engineering, etc.

Like other societies, scientific societies arose in response to a need felt by persons of similar ideas for opportunities of meeting together, reporting on and discussing recent progress in their own field. Since the sciences were neglected by the universities, these societies served a further want. Besides affording opportunities for meetings and discussions, scientific societies have helped to organize research, have recorded discoveries, have assisted students, and have encouraged study

SCIENTIFIC SOCIETIES

through prizes, medals, etc. Further, the existence of common centers prevents overlapping, secures recognition where it is due, and provides for continuity of research. Most societies of standing publish records of their work under the title of *Papers*, *Proceedings*, *Transactions*, *Publications*, or *Memoirs*.

England.—Scientific societies in England take their origin from three societies which at first embraced the sciences in general and then sent out offshoots for specialized departments or were imitated on smaller scale. The earliest society in England was probably the Society of Antiquaries which was founded by Archbishop Parker and began to hold meetings in 1572 at the house of Sir Robert Cotton for the study of "the antiquities of this and other nations." It enjoyed the favor of Queen Elizabeth, but for some reason it was dissolved by James I in 1601, to be revived in 1707, reconstituted in 1718, and chartered in 1751. This society led to the foundation of the following: Society of Antiquaries of Scotland, 1780; Literary and Antiquarian Society of Perth, 1714; Society of Antiquaries, Newcastle-on-Tyne, 1813; Royal Numismatic Society, 1836; Royal Society of Antiquaries of Ireland, 1819; Royal Historical Society, 1868; Society of Biblical Archaeology, 1871; Palaeontographical Society, 1873; Society for Hellenic Studies, 1876; Royal Archaeological Institute, 1843; British Archaeological Association, 1843; Ethnological Society, 1843; Anthropological Society, 1863; Anthropological Institute, organized by union of the two preceding, 1871, and called "Royal" since 1907; Folk Lore Society, 1878. In 1615 a small society was formed in London for scientific study, and held weekly meetings. From this a branch was split which was organized at Oxford in 1848-1810 as the Philosophical Society, and continued until 1690. In 1660 the Royal Society was established and was chartered in 1662, many members of the earlier society being enrolled.

Royal Society.—In 1602 the Society was incorporated by royal charter from Charles II under the title of the Royal Society, a name which it is stated was first used by John Evelyn. The charter was confirmed in 1660. Gresham College was the recognized place of meeting. The Royal Society from the first supported and announced important discoveries. It is claimed that in the disputes with regard to Dr. William Harvey's doctrine of the circulation of the blood, the Royal Society consistently supported Harvey. Boyle's experiments with the air, culminating in his air pump, and Goddard's experiments with colors were amongst the earlier records of the Society. Petty produced accounts of experiments with regard to shipping, and Christopher Wren on the pendulum. Already in 1601 a committee was appointed to consider "questions to be inquired of in the remotest

SCIENTIFIC SOCIETIES

parts of the world." King Charles II sent communications with inquiries as to loadstones and sensitive plants, and Wren was requested to make a globe of the moon for the king. In 1665 the Society ordered the Philosophical Transactions to be composed by Henry Oldenburg to be printed monthly if there were sufficient matter. After the Great Fire of London in 1666, Henry Howard made a gift to the Society of the Library of Arundel House. The collection consisted of 3287 books, chiefly first editions of books soon after the invention of printing, together with 514 volumes of choice MSS. The present library of the Royal Society consists of over 60,000 scientific books on scientific subjects.

Earlier in 1666, a collection of rarities belonging to Mr. Hubbard was purchased and became the nucleus of the Royal Society's Museum, which has for the most part been dispersed. One of the most interesting facts about the Royal Society is the association with it of Sir Isaac Newton, who was elected a Fellow in 1671, but held the presidency from 1703 to 1727, in which year he died.

The Royal Society was in close touch with foreign scientists from the first. Amongst the earliest members were Theodore Haak and Nicholas Mercator. Marcello Malpighi, the great biologist, sent communications from 1666 onward, and in 1671 the great Leibnitz dedicated a work to the Society. Huguenot religious refugees, including Denis Papin, De Noivre, Durand, Desaguliers, and Desmazieux, were a great intellectual and particularly a scientific asset to England and to the Royal Society.

In 1730 the number of foreigners who were members was seventy-nine, and it was at that date resolved that those foreign members, who had previously paid the same subscription as English members, should be absolved from payments. In 1780 a tendency set in to render admission more difficult. In 1847 it was decided that the number of admissions to the Society by the Council should be limited to fifteen yearly, and this limitation is still in force. Fellows by the constitution of the Society pay entrance fees and subscriptions, but a fund was provided in 1878 which reduced the payments required. The rest of the income is derived from rents and interest on various investments. Copley, Davy, Hughes, Rumford, Darwin, Sylvester, Buchanan, are among the most distinguished members, and the two royal medals are amongst the most distinguished recognitions of scientific work of Great Britain. The Royal Society is intrusted by the government with the administration of the annual grant of £1000 for the promotion of scientific research, and also receives £1000 in aid of scientific publications. The Society publishes a *Yearbook* and a *Record* of its history (1901). Of the papers read before the Society, a selection is made by a Com-

SCIENTIFIC SOCIETIES

mittee *ad hoc*, and these are published in the *Philosophical Transactions* or in the *Proceedings of the Royal Society*. The Royal Society has also issued a work of altogether outstanding importance, viz the *Catalogue of Scientific Papers*, an *Index* under authors' names to the chief English and foreign scientific periodicals from 1800 to 1883, in twelve volumes. This *Catalogue* has recently been continued to the end of the nineteenth century, with the addition of a subject index to the whole catalogue.

Other National Societies. The most prominent organizations in the eighteenth century were the Medical Society, 1773, the Linnæan Society for Natural History, 1788, both direct offshoots of the Royal Society, and the Royal Institution (*q.v.*), 1799. How specialized were the societies formed in the last century becomes obvious from a reading of their names. Horticultural Society, 1801; Zoological Society, 1826; Entomological Society, 1833; Ornithological Society, 1837; Royal Botanic Society, 1839; Ray Society (for the publication of works on British natural history), 1841; Geological Society, 1807; Geologists' Association, 1853; Mineralogical, 1870; Royal Astronomical Society, 1870; Royal Geographical Society, 1830; Institution of Civil Engineers, 1818; Institution of Mechanical Engineers, 1847; Mining Engineers, 1851; Iron and Steel Institute, 1869; Electrical Engineers, 1871. Mathematics, physics, and statistics have each their special societies; while medicine, general and special, is represented by a large number of organizations. Although the most important societies are necessarily located in the capital, there are numerous provincial societies which in their own way make their contribution to scientific progress. In Scotland the Royal Society found an early imitator in the Royal Society of Edinburgh, a reorganization in 1783 of the Edinburgh Philosophical Society which had been founded in 1737. The Royal Society of Edinburgh is divided into two classes, literary and physical, the latter being the more active and awarding prizes for scientific work. The Royal Philosophical Society of Glasgow was founded in 1802 "to aid the study and development of the physical, mental, and moral sciences, the arts of design, and the diffusion of scientific knowledge." In Ireland the Royal Society of Dublin, 1731, and the Royal Irish Academy, 1786, were founded to promote among other studies that of science.

The third society which has served as the model and parent of many others, especially in the field of the applied sciences and design, is the Society for the Encouragement of Arts, Commerce, and Manufactures, 1754, known since 1900 as the Royal Society of Arts. It was founded "for the encouragement of the arts, manufactures, and commerce of the country by bestowing rewards for inven-

SCIENTIFIC SOCIETIES

tions, services in fine arts, improvements in applied science. . . ." An art exhibition held by the Society led to the foundation of the Royal Academy, and the Society was responsible for suggesting the International Exhibition of 1851. As a result of meetings held by the Society, there were formed the Chemical Society, 1841; Institute of Chemistry, 1877; Society of Chemical Industry, 1881, the Sanitary Institute, 1881, and several others. In 1821 the Royal Scottish Society of Arts was established, and in 1838 the Royal Agricultural Society, which had already been preceded by agricultural societies in Scotland and Ireland.

Of a somewhat different character, although similar in aim, is the British Association for the Advancement of Science, which met first on the suggestion of Sir David Brewster at York in 1831. Its aim is "to promote science, to direct general attention to scientific matters, and to facilitate intercourse among scientific men." Unlike the other societies, the British Association is itinerant and meets each year in a different town of the British dominions. The Association has eleven sections, as follows: (a) mathematical and physical science; (b) chemistry; (c) geology; (d) zoology; (e) geography; (f) economic science and statistics; (g) engineering; (h) anthropology; (i) physiology; (j) botany; (k) educational science.

The following may be given as a representative, but by no means complete, list of English scientific societies located in London; no account is here given of the numerous and important provincial societies.

	DATE OF FOUNDATION
Royal Astronomical Society	1820
London Mathematical Society	1805
Royal Meteorological Society	1850
Physical Society of London	1874
Chemical Society	1841
Institute of Chemistry of Great Britain and Ireland	1877
Pharmaceutical Society of Great Britain	1841
Royal Geographical Society	1830
Geological Society of London	1807
Linnæan Society of London	1758
Royal Anthropological Institute of Great Britain and Ireland	1871
Zoological Society of London	1826
Royal Botanic Society of London	1839
Royal Microscopical Society	1830
Anatomical Society of Great Britain and Ireland	1857
Ray Society	1844
Royal Statistical Society	1834
Institution of Civil Engineers	1818
Institution of Mechanical Engineers	1847
Royal Agricultural Society of England	1838
Royal Horticultural Society	1804
Medical Society of London	1773
British Medical Association	1822
Latter Institute of Preventive Medicine	1801
Royal Society of Medicine (formed by the amalgamation of numerous sectional medical societies which had sprung up during the century)	1907

United States.—Owing to the natural and material difficulties to be overcome in a young and unsettled country, the progress of science and the demand for scientific information developed slowly in the United States. To this fact must be added the inadequacy of the schools and the neglect of the sciences in the

SCIENTIFIC SOCIETIES

colleges. In the first century of its existence there were many American members of the Royal Society. When the American scientific societies began to be established, two influences may be noticed, the one came from England, and the societies were founded in imitation of the Royal Society, especially under Franklin's influence, the other came from France, and even the French titles were adopted, as in the case of the American Academy of Arts and Science at Boston. The latter influence may also be traced in Jefferson's (*q.v.*) proposals during his presidency of a central institution. The first suggestion for the foundation of a scientific society came from Benjamin Franklin (*q.v.*) in a paper entitled, *Proposal for promoting useful Knowledge among the British Plantations in America*. In the following year he founded the American Philosophical Society, of which Thomas Hopkinson was president and himself secretary, and which included John Bartram, the botanist, and Thomas Godfrey, the mathematician. This society was soon discontinued, however, only to be revived and reorganized in 1767-1768 as the American Society held at Philadelphia for Promoting Useful Knowledge. In 1769, on the occasion of a union with the Junta, or Society for the Promotion of Useful Knowledge (*f. before 1758*), the title was changed to the American Philosophical Society held at Philadelphia for Promoting Useful Knowledge, of which Franklin was president till his death. This is probably the oldest society of its kind in the country, has published *Transactions* since 1789, *Proceedings* since 1833, and has a large library. The Academy of Natural Science of Philadelphia was founded in 1812 and is devoted to the study of natural history. It possesses the most complete museum and library in this subject in the country and a valuable museum in conchology and ornithology. The American Academy of Arts and Science was founded in Boston in 1780 to encourage the study of American history and the natural history of the country. The Linnæan Society, founded in 1813, was succeeded by the Boston Society of Natural History, 1830, for general nature study. It possesses a library and collections of New England natural products and mineralogy. In 1799 the Connecticut Academy of Arts and Science was established at New Haven for the collection of statistics of the state, but later added also the study of science. The work of the Lyceum of Natural History, 1818, has been continued by the New York Academy of Science, 1870, which possesses a library and museum of natural history, and published *The New York Academy of Science* (1876), a continuation of the *Annals of the Lyceum of Natural History* (1821-), and the *Proceedings* (1873-), and *Transactions* (1881). The Peabody Academy of Science was founded

SCIENTIFIC SOCIETIES

by George Peabody (*q.v.*) at Salem, Mass., for the promotion of science and useful knowledge. The American Association for the Advancement of Science originated at Boston at a meeting of the Association of American Geologists and Naturalists in 1847, and its purpose was declared to be "by periodical and migratory meetings to promote intercourse between American scientists, to give a strong and more systematic impulse to research, and to procure for the labors of scientific men increased facilities and wider usefulness." Annual meetings are held in different towns of the country and *Proceedings* have been published since 1849. Since 1900 *Science* has been the official organ of the Association. The following sections are represented in the Association: (a) mathematics and astronomy; (b) physics; (c) chemistry; (d) mechanical science and engineering; (e) geology and geography; (f) zoology; (g) botany; (h) anthropology and psychology; (i) social and economic science; (k) physiology and experimental medicine; (l) education. Many other societies are affiliated and hold their meetings at the same time and place as the American Association. The National Academy of Science was organized in 1883 as the successor of the National Institution for the Promotion of Science and the Useful Arts, which had been organized at Washington by Act of Congress in 1840, to collect scientific material for the United States National Museum (*q.v.*). The National Academy examines and reports on scientific questions submitted to it by government departments, which pay the actual expenses of the investigation. The original membership was limited to fifty, but this restriction has been removed. There are two sections, mathematics and physics, and natural history. The Washington Academy of Science was founded in 1898 out of a number of other societies, — the Anthropological Society, Biological Society, Geological Society, National Geographical Society, the Medical Society of the District of Columbia, and the Philosophical Society of Washington.

The following is a list of the more important national, state, and local scientific societies which are actually engaged in promoting research or in making collections of materials upon which the scientist may work, especially in the fields of natural history, archeology, anthropology, and ethnology.

	DATE OF FOUNDATION
American Anthropological Society	1902

France. — The scientific societies of France are a product largely of the nineteenth century and to a large extent are located in Paris. The prototype of them all, however, the *Académie des Sciences*, was definitely established in 1666 by Colbert, and had probably been in existence unofficially several years before that date. Originally it met for the discussion of mathematical and physical questions. It was reorganized in 1690 and received royal approval, and was thus placed on an equal footing with the other academies (See *Academy*). In 1785 its work was divided among eight sections: geometry, astronomy, chemistry, metallurgy, botany, agriculture, natural history, and mineralogy. During the Revolution it was not dissolved permanently, like the other academies, but was retained by the government for the public good. In 1795 the *Académie des Sciences* became a class of the newly created *Institut National* with ten sections: geometry, mechanics, astronomy, general physics, chemistry, mineralogy, botany, rural economy, anatomy and zoology, medicine and surgery, to which another section — geography and navigation — was added later. The *Académie des Sciences* publishes *Comptes rendus hebdomadaires des Séances*, and *Mémoires* (See *Institute, French*). Another class, the fifth of the *Institut de France*, is the *Académie des Sciences morales et politiques*, established in 1795 for the study of philosophy, history, and political science. It was suppressed in 1803 by Napoleon, but was revived in 1832. Its work is covered by five sections: philosophy, ethics; legislation, public law, and jurisprudence; political economy, statistics, and finance, general and philosophical history. It publishes *Mémoires* (since 1835) and *Séances et Travaux* (since 1842). The *Académie de Médecine* was established in 1820 to continue the work of the *Société de Médecine* and the *Académie de Chirurgie* (1731), which had

been dissolved in 1793. It is an official body, in so far as the government may refer to it on questions of public health. It consists of ten sections: anatomy and physiology, medical pathology, surgical pathology, therapeutics and medical natural history, pathological anatomy, obstetrics, public health and sanitation, veterinary medicine, medical physics and chemistry, and pharmacy.

These academies are public bodies and are maintained by the government, which pays annual salaries to the members and awards prizes and honors. But, unlike other countries, the government also subsidizes many of the other scientific societies of the country, and through the *Comité des Travaux historiques et scientifiques* in the Ministry of Public Instruction and Fine Arts it directs and coordinates the work of the societies. This *Comité*, founded in 1834 and reorganized by decree of May 12, 1883, consists of a president and members representing the five sections: history and philosophy, economic and social sciences; archaeology, physics and chemistry, meteorology, and natural sciences, historical and descriptive geography. It encourages intercourse between different societies, directs their publications, and organizes scientific congresses annually in Paris. It also publishes a number of pamphlets and bulletins bearing on the work of each section and a bibliography of the publications of the societies. Congresses of scientific societies have been held in France since 1833, the first, the *Congrès scientifique*, meeting at Caen. In 1862 a *Congrès des Sociétés Savantes*, in imitation of an annual congress organized in 1846 by M. de Caumont, met at the Sorbonne under the auspices of the Ministry of Public Instruction and Fine Arts. This congress now meets annually at the Sorbonne under the sections: history and philology, archaeology, and sciences. Founded in imitation of similar societies in England and America, the *Association française pour l'Avancement des Sciences* is a migratory body holding annual conferences in different parts of France to stimulate progress and diffusion of the sciences, theoretical and applied. It was established in 1872, and in 1885 was amalgamated with the *Association scientifique de France* (f. 1864). Among other general scientific societies may be mentioned the *Conférences Ampère*, established in 1888 for the study of sciences and philosophy; the *Société philomathique de Paris*, established in 1788 for the study of mathematical, physical, and natural sciences, the *Société philotechnique*, founded in 1795, to promote the study of letters and sciences. In the following list of French scientific societies the majority are national in scope and are located in Paris. Of the provincial societies, however, only a few are selected, they are very numerous, and in many cases are doing work of an important character. Many of the French

SCIENTIFIC SOCIETIES

societies have received charters of incorporation (*reconnaissance d'utilité publique*), but this incorporation is not so universal as in Great Britain and the United States.

Germany. — The development of scientific and learned societies in Germany was due on the whole to foreign influences. The earliest of these was modeled probably on the Italian academies. This was the *Academia naturæ curiosorum* established by Dr. Bausch in Vienna in 1652. Its title was changed in honor of Leopold I and Charles VII to the *Kaiserlich-Leopoldinisch-Carolinische deutsche Akademie der Naturforscher*. For many years

this remained the only society of its kind in German-speaking Europe. It is still in existence and has its seat at Halle. The *Akademie der Wissenschaften*, which represents the best of German scholarship and research, was founded as the *Société des Sciences* in 1700 by Frederick I on the suggestion of Leibnitz, who became its first president. The formal opening did not take place until 1711. Its existence, owing to the refusal of supplies by its royal patron, was precarious until its reformation in 1744 by Frederick the Great as the *Académie des Sciences et Belles-Lettres de Prusse*. Maupertuis became president in 1740. After a period of decline under Frederick William II it rapidly recovered, and its position as one of the first societies of its kind in the world was soon assured. Its work is divided into two classes, physical-mathematical, and philosophical-historical. Its members are divided into ordinary, honorary, and corresponding. It receives a large annual subsidy from the state and owns much property, which came into its possession under Frederick the Great. Its most important contribution has been in the field of history. The publications of the Academy consist of *Abhandlungen* and *Monatsberichte*. Unlike Paris and London, Berlin is by no means the intellectual center of Germany. Hence many important societies are found throughout the country, some at the seats of universities, others in the capitals of the federal states. Enjoying in the early years of its history almost as great a reputation as the Academy in Berlin, the *Gesellschaft der Wissenschaften* at Göttingen has made valuable contributions in the field of pure science. Founded in 1751, it was definitely organized in 1770 and now consists of two classes, mathematical-physical and philological-historical. It publishes *Abhandlungen*, *Nachrichten*, and the famous *Göttingische Gelehrte Anzeigen*. The *Königliche Bayerische Akademie der Wissenschaften*, founded in 1750, originally for historical study only, now takes general knowledge for its field. Its work is divided into three classes: philosophical-philological, mathematical-physical, and historical. While its best-known work has been in history (*Monumenta Boica*), the Academy is at present responsible for a scientific investigation of the kingdom and a Commission for the International Survey. While not itself a scientific society, the *Fürstliche Jablonowskische Gesellschaft der Wissenschaften*, which was founded in 1771 at Leipzig and offers prizes for and publishes work in history, antiquities, political economy, mathematics, and sciences, deserves a place here. It is divided into three classes, linguistic-philological, historical-economic, and scientific-mathematical, each of which offers an annual prize of \$300 for a treatise on a prescribed subject. The *Königliche Preussische Gesellschaft der Wissenschaften* was founded

SCIENTIFIC SOCIETIES

in 1840 for the study of philology, history, mathematics, and natural sciences, which are now grouped into two classes. The society receives an annual subsidy and publishes *Abhandlungen* and *Berichte*. The Gesellschaft deutscher Naturforscher und Ärzte, which also has its seat at Leipzig, deserves mention as probably the earliest of the migratory societies in Europe. It was founded in 1822 by Humboldt, and the first national congress was held at Leipzig. Historically this society was the immediate predecessor and model of the British Association.

It would be impossible in so brief an account to do more than give a list of the more representative societies in the larger towns. But it must be understood that there are in Germany very few places of any size which do not possess a local scientific society, for nowhere is the instinct of association stronger than in this country.

International Congresses — Finally, a brief list is here given of the international associations and congresses which have been established to unite the scientists and students throughout the world. These groups represent the culmination of the cooperative spirit which

SCIENTIFIC TESTS

has led to the establishment of scientific societies (See, further, INTERNATIONALISM.)

	DATE OF FOUNDATION
Association Internationale pour Progrès des Sciences sociales (Brussels)	1853
International Meteorological Congress (Brussels)	1854
Congrès International de Statistique (Brussels)	1855
Société Internationale des Études pratiques d'Économie sociale (Paris)	1856
Congrès International d'Archéologie et d'Anthropologie préhistorique (Spiez)	1863
International Astronomical Congress (Heldelberg)	1863
Congrès International d'Horticulture (Brussels)	1861
Congrès International de Botanique (Amsterdam)	1865
Congrès Médical International (Paris)	1867
Congrès International pour le Progrès des Sciences géographiques (Antwerp)	1871
Congrès International des Orientalistes (Paris)	1873
Alliance Scientifique Universelle (Paris)	1870
International Conference of Librarians (London)	1877
International Congresses of Geology (Bologna)	1875
International Electrical Congress (Paris)	1881
Bénéf. International pour Études des Questions d'Assistance (Paris)	1890
Institut International de Sociologie (Paris)	1893
Internationale Association der Akademien (Weissenbaden)	1890
Internationale Vereinigung für Krebsforschung (Berlin)	1903
Internationale Vereinigung für Rechts und Wirtschaftspraxis (Berlin)	1900
Internationale Vereinigung der Chemischen Gesellschaften (Dortm)	1911

SCIENTIFIC TESTS. — A distinction may be drawn between the ordinary educational test, such as written examinations, and the definite measurements of mental abilities which are undertaken for the more accurate determination of native ability and the effects of educational processes.

SCOTLAND, EDUCATION IN. — In recent years considerable progress has been made in the organization and unification of education in Scotland, and the country may now be said to possess a well-organized system of primary, secondary, higher, and technical education. Though by no means so highly centralized as in France or Germany, the present system is a great advance upon what formerly obtained. The scheme as a whole is distinguished by its continuity, its carefully defined grades, and its recognized connecting links. Every parish is well provided with primary schools, secondary education is concentrated in natural centers, and at the same time the interests of pupils in outlying districts are safeguarded, universities and technical colleges are well distributed. The administration of Scottish education is an affair partly of the state and partly of local *ad hoc* bodies. The state subsidizes public education of all grades and thereby exercises, either directly or indirectly, an influence over it. As regards primary, secondary, and technical education, this influence, working through the Scotch Education Department, is very powerful. On the other hand, the universities are subject to no such close supervision or control, but possess a large amount of freedom and independence which they jealously guard. Adequate local financial support, whatever form it may take, is an invariable prerequisite to state aid. In the case of primary and secondary education this may mean, and usually does mean, the imposition of a local rate, but no local rate may be levied for university education. As distinct from England, the people are largely of one religious belief, Presbyterianism, and hence comparatively free from sectarian differences. Church superintendence of public education, however, so prominent in the past, was finally abolished in 1872.

History. — Extant documents afford ample evidence of the existence of schools in Scotland from the beginning of the twelfth century. Such schools were part of an ecclesiastical organization and probably differed little, if any, from contemporary schools in continental Europe. At the Reformation (1560) the new church took over the superintendence of education. John Knox (*q.v.*) and his colleagues outlined in the *First Book of Discipline* a comprehensive scheme of education which was to be financed from the patrimony of the old church. The rejection of these proposals deferred the realization of a national system of education for more than three centuries. The church long maintained its

authority over education. Its claim to jurisdiction over schools and colleges was based upon the act of 1567, confirmed by Parliament in 1581, and again in 1592. During the seventeenth and eighteenth centuries frequent references to this right are to be found in the acts of the General Assembly and the records of kirk sessions. From early times, even before the Reformation, town councils claimed, usually with success, a right to the patronage of burgh or grammar schools; but church "visitations" were quite common down to 1872. On the other hand, the jurisdiction of the church over the parish school was never questioned, and when this school was established by law in 1616 and 1633, the church was associated in its future management.

Notwithstanding the parliamentary acts of 1649 and 1690 the parish school proved to be inadequate to meet growing demands in education, and in consequence a subsidiary system of voluntary denominational schools was grafted upon it in the eighteenth century. The statutory system was managed locally and maintained by local assessment; the voluntary, by various religious bodies and financed largely by subscription. When the practice of giving parliamentary grants to education was instituted (1833) and the Education Department was created (1839) to administer them, both systems to a limited extent received a share of these grants, this continued until the passing of the act of 1872, when the Scotch Education Department was created and the school-board system inaugurated. The parish school has had a deep influence upon national life in Scotland. The parochial schoolmaster was often a man of university attainments, who, in addition to teaching primary subjects, and indeed often to their neglect, instructed his more capable pupils in the higher subjects required for entrance to the university. Thus the parish school and similar schools were immediate avenues to the university. As a tradition this has left an indelible mark upon subsequent educational developments. At the time, however, it contributed to make the standard of the Arts course of the university little higher than that of a good secondary school of the present day. By a clause in the act of 1872 the right to give higher instruction was specially conserved to the parish school, and the problem in succeeding years was how to give effective expression to it. After several experimental stages, an admirable solution was found in the creation of the higher grade school (1899), which may be looked upon as the descendant of the best of the old parish schools. This school, of course, was under the management of the school board.

Curiously enough, except as regards church superintendence, the burgh school practically stood outside parliamentary legislation. The well-known act of 1406 by which the sons of

barons and freeholders were to be kept at the grammar school from the age of eight or nine until they were "competentlie foundit" and had "perfitte latyne" is of historic interest, but it does not appear that it was at all effective. Throughout the sixteenth and seventeenth centuries the teaching of Latin was the chief function of the grammar school. In the eighteenth century a new type of school under the name of academy (*q.v.*) came into existence for the purpose of providing an education not entirely classical, and in the first half of the next century a number of subscription or endowed schools, as well as private schools, were founded. While the burgh school, the lineal descendant of schools which existed in the twelfth century, was administered by the town council, which maintained the school building, and, in general, provided a small salary for the teacher, the others, as a rule, were controlled by managers appointed by the subscribers. The character, work, and organization of these schools varied greatly, there was no common aim or standard, and the curricula often overlapped that of the university. The report of the Argyll commission (1864) contains a mass of interesting facts regarding them. It may be added that a common feature then, as now, was coeducation. In 1872 was passed the Education (Scotland) Act which, though supplemented by the acts of 1878, 1901, and 1908, is the basis of the present system. Burgh schools, providing an education not consisting chiefly in elementary instruction in reading, writing, and arithmetic, passed immediately under the management of school boards and received the name of higher class public schools. Other schools, providing higher education, either elected to come under the same management and received the same name, or remained under their former managers and took the title of higher class schools.

It should be stated that the act of 1872 had no relation to universities, secondary education committees, or state aid to secondary schools. It would be both interesting and instructive to trace recent developments in connection with the two latter, but space will not permit of it.

Administration.—Public education in Scottish schools is administered by (a) the Scotch Education Department, (b) school boards or other local authorities, and (c) secondary education committees.

The Scotch Education Department (the "Department"), which consists of "The Lords of any Committee of the Privy Council appointed by her Majesty on Education in Scotland," is the central authority. The Lord President of the Council is *ex officio* president of this committee, but as a guarantee that proper attention shall be given to the special requirements of Scotland, the secretary for Scotland is vice president of the committee,

SCOTLAND

and by the Secretary for Scotland Act, 1885, is responsible to parliament for the administration of the Department. Attached to it is a permanent secretary, assisted by a staff of officials. The main duties of the Department are (1) to frame a code of regulations (the Code), under which the annual grant for day schools is distributed, and to administer the grant; (2) to frame the continuation class code and administer the grant, (3) to regulate and administer the grants to secondary schools; (4) to distribute the Education (Scotland) Fund, and superintend the administration of the district funds by the district committees; (5) to administer the Scottish teachers' superannuation fund; (6) to maintain a system of inspection over schools receiving grants, and to regulate and conduct the leaving certificate examination; (7) to regulate the training and certification of teachers; and (8) to submit annually to parliament estimates of the annual grant required and a report of its own proceedings under the education acts. To assist the Department in its work of supervision, the country is divided into four "divisions," to each of which is attached a chief inspector and staff. In all there are twenty-eight inspectors, nine junior inspectors, and thirty subinspectors.

The school board is the statutory local authority. The country is mapped out into 971 education areas, corresponding, in general, to the existing burghs and parishes, and for each of these a school board is elected triennially by the local ratepayers. While these boards may, and to a certain extent do, make provision for secondary and technical education, their primary duties consist in providing and maintaining efficient school accommodation and instruction in their own areas for all children between the ages of five and fourteen, within which limits attendance at school is compulsory. School boards may, however, grant exemption to pupils between the ages of twelve and fourteen, in which case they have the power of demanding attendance from them at continuation or other classes up to the age of sixteen. They may charge school fees, which, if the school receives a share of the annual grant, must not exceed a certain amount; in general, however, education is free up to the age of fourteen. As managers they are responsible for the school time-table and determine the character of the religious instruction, if any, to be given, though they cannot compel attendance at it. They appoint the teachers, remunerate them, and, subject to an appeal to the Department, may dismiss them. Further, they may provide for the medical inspection of children, make provision for the preparation and supply of meals for pupils and give clothing and food in necessitous cases; provide schoolbooks and stationery free; defray the cost of conveying pupils to schools from outlying districts; and

SCOTLAND

maintain any agency for collecting and distributing information regarding employment for children on leaving school.

To meet these expenses each school board is provided with a school fund into which are paid all parliamentary grants, monies raised by loan, school fees (if any), and other sums received for the purposes of the fund. On requisition being made to the local parochial board, any deficiency in any year is met by a subvention from the local rates. For providing equipment of a more permanent character the school board, on the approval of the Department, may raise loans, the repayment of which may be spread over a number of years. An annual account of its receipts and expenditure is submitted to the audit of the Department's accountant, and illegal payments may be disallowed.

Although the school boards are the statutory local authorities, the managers of voluntary schools in receipt of parliamentary grants, and the managers of endowed secondary schools and similar schools are the local authorities for their own schools and manage them independently of the local school board, but receive no financial assistance from the local rates. Private schools are comparatively few in number, but may be entered, inspected, and examined by fit and proper persons appointed by the relevant school board and the Department. In practice, however, they are subject to little or no interference.

While the central authority supervises the distribution of grants, and by its codes and minutes — both of which have to be laid upon the tables of the two Houses of Parliament before becoming law — makes regulations for safeguarding public interests in the expenditure of imperial funds on education, the local authority is allowed a reasonably fair amount of liberty in the management of its schools.

The secondary education committee, created in 1892, is a district committee. For certain educational purposes the thirty-three counties, the five chief burghs, and one large parish, are constituted educational districts and each provided with a committee. Each of these committees, the constitutions of which are remodeled from time to time, consists of members elected or nominated by local and district public bodies, directly or indirectly interested in education, and an inspector or other official nominated by the Department as its assessor. Additional members specially interested in education may be co-opted by the committees themselves. Their functions, which relate not merely to secondary education but to all forms of education beyond the resources of individual school boards, are concerned mainly with the distribution of the district education funds, and are best considered in connection with the Education (Scotland) Fund (1908). This fund, consolidating various parliamentary grants for education,

SCOTLAND

is distributed in the following manner. Educational objects of national importance, which cannot properly be put upon the rates of any one district, have first consideration. Thus the cost of inspecting secondary schools and conducting the leaving certificate examination is a first charge upon the fund, as well as grants to universities, central institutions, and provincial committees, and grants in aid of retiring allowances to teachers. The balance is then formed into district funds, one for each district of a secondary education committee, in accordance with a scheme of allocation prepared by the Department, which takes into account both the relative cost of education and the relative wealth or poverty of each district. A first charge upon each district fund is expenditure which is not properly referable to any one school board area—such as payments to local authorities in respect of the higher education provided by them for pupils outside their educational areas, payments to school boards when the charge upon the local rates in respect of higher instruction exceeds a certain sum per pound, and payments for half the cost of the medical inspection provided by school boards. In addition, payments may be made for the provision of a district bursary scheme to enable pupils to receive higher instruction at suitable centers, and for traveling expenses and maintenance allowances of teachers attending special courses of instruction at some center. Each secondary education committee annually prepares an estimate of its proposed expenditure, and submits it for the approval of the Department. Whatever balance remains in any year is distributed among the local authorities of the district as an addition to the fee grant.

Organization.—In 1906 the Department adopted a new classification of schools—primary, intermediate, secondary—based upon distinctions in curricula. While this nomenclature is very convenient and will doubtless supersede the older one, the former distinctions still hold in respect of grants. Higher grade schools receive grants under the code, higher class schools, public or otherwise, receive grants under regulations specially applicable to secondary schools.

Primary Education.—The primary school provides for the instruction of pupils up to the age of fourteen. The normal organization to the age of twelve is infant division (5-7), junior division (7-10), and senior division (10-12). While the main subjects of instruction are reading, writing, and arithmetic, provision is made for teaching certain auxiliary subjects—history, geography, physical exercises, singing, drawing, nature knowledge, and others. Individual examination in general has been abolished, the business of the inspector is to advert to deficiencies in the curriculum and on grave faults in method. The successful termination of this course is attested by the

SCOTLAND

qualifying examination, in which the judgment of the teacher is the main determining factor. Beyond this the work bifurcates into a supplementary course (continuation of primary), or the intermediate course (first stage of secondary). The former is a specialized course—commercial, industrial, rural, or domestic,—designed for those who intend to leave school at or about the age of fourteen, and is crowned by the merit certificate. Such courses may or may not be provided in the same school as the primary instruction proper. In towns there is a tendency to set apart schools exclusively for this work.

Intermediate Education.—An intermediate course extends over at least three years (12-15) beyond the stage of the qualifying examination. It is prescribed by the Department and is intended to provide a broad general education in English, history, geography, mathematics (including arithmetic), at least one language other than English, science, and drawing. A school with such a course ranks as an intermediate school. In general a higher grade school falls into this group. On the satisfactory completion of the course an intermediate certificate is granted. This certificate, or its equivalent, is the prerequisite to a leaving certificate.

Secondary Education.—A school providing a course of secondary education of at least five years' duration beyond the qualifying examination stage is termed a secondary school. In general, higher class schools of both types form this group, although some higher grade schools are also included. The five years' course is divided into the intermediate course (three years) and the secondary course (two or more years). The character of the former has been described above; the latter is determined by the local managers with the approval of the Department. If adequate provision can be made for them, several courses may be offered, and to a certain extent specialization on definite lines—classical, scientific, modern languages, commercial—may be permitted, always provided that English, one foreign language, and either mathematics or science are included in each group, and have been carried to what is known as the higher standard. The granting of a leaving certificate testifies to the satisfactory completion of any one secondary course.

This organization has been effected by the Department in a series of steps, mainly in virtue of its control of the leaving certificate examination and of the parliamentary grants given to secondary education. Schools which receive grants under the Code, such as primary schools and higher grade schools, have from the first been directly under the control of the Department, but higher class schools were on a different footing. Beginning in 1892, successive grants have been made to secondary education on certain conditions which in practice mean that schools sharing in these

grants, and practically all higher class schools do participate in them, come under the control of the Department. Further, the leaving certificate examination, instituted by the Department in 1888, is accepted by almost all intermediate and secondary schools, and the control of this examination practically means the control of the curriculum. At first the examination was one of individual subjects, but in recent years it has developed more on the lines of the *Abiturienteneamen*, in so far as it is a test of the satisfactory completion of a course of study. The intermediate examination is a written and oral examination in the subjects of the intermediate course. Due weight is given to the teachers' opinions, and deficiencies in individual subjects may be compensated for by excellence in others. The leaving certificate is granted on principles similar to those adopted for the intermediate. Provided the leaving certificate testifies to the satisfactory conclusion of a course which includes the subjects demanded by the entrance examination of the university, it is accepted by the university as giving immediate and unreserved entrance to its courses, and to this extent the work of the secondary school is articulated to that of the university.

Training of Teachers — A new system of training teachers was adopted in 1905-1906 which has practically superseded the former system of pupil teachers and denominational training colleges. A provincial committee for the training of teachers has been established in each of the four university centers with a "province," embracing several counties, assigned to it. Its members comprise representatives of educational bodies—universities, colleges, secondary education committees, training colleges (if transferred to the committee), as well as co-opted teachers, and a chief inspector as the Department's assessor. Its functions are to provide for the suitable training of teachers, including teachers of higher subjects in secondary schools as well as teachers of special subjects, and to establish courses for the further instruction of teachers in actual service. Each committee has an executive officer and a staff of instructors, and arranges its own scheme of courses. The expenditure, which is met out of parliamentary grants, is under the close supervision of the Department. Maintenance allowances may be made by the committee to its students, and hostels or residential institutions established and subsidized.

The course of training is taken in two stages — junior student and senior student. A candidate for a junior studentship must have gained an intermediate certificate, and been nominated by a secondary education committee, by whom a maintenance allowance may be granted. As the output of trained teachers is best controlled at its source, the number of nominations to junior studentships

is regulated by the Department. Each secondary education committee has the option of nominating a certain number, the allocation being based mainly on the relative population of the districts. A three-years' course of training in certain subjects of general education, defined by the Department, and in the art of teaching follows. This course is given in any one of a number of secondary schools selected for the purpose, and known as junior student centers. The satisfactory completion of the course is attested by the junior student certificate. The student may then enroll under a provincial committee as a senior student for a two-years' course as a minimum, in which prominence is given to the purely professional part of the training. While the attainment of the general certificate is the primary object of the senior student, those students who on entering possess a leaving certificate, or show aptitude for special subjects, as attested by a junior student certificate or its equivalent, may be allowed to attend any class at a university or central institution, their instruction and training being based on a well-defined curriculum which may extend over three or four years. Thus a capable student may obtain a university degree or college diploma in addition to the teacher's general certificate. Thereafter two years of satisfactory service in an approved school are required before the permanent certificate is issued.

Teachers of higher subjects and specialists must acquire an extended knowledge of the branch of study they propose to teach, and undergo at least one year's professional training, with special reference to that particular branch, under one of the provincial committees. A subsequent probationary year in some approved school is enjoined upon them before they are finally recognized as fully certificated.

Statistics (1911) — Census population, 4,730,445. *Annual grant schools*: total number of day schools (primary and higher grade), 3369, accommodation provided, 1,077,269, average on registers during the year, 817,084; average attendance, 753,068, average on registers at end of year, 845,055, certificated teachers—male, 5180 (1021 graduates), female, 13,680 (857 graduates), assistant teachers—male, 122, female, 1000, pupil teachers—male, 15, female, 259, average salaries of certificated teachers—headmasters, £168 5d; assistant masters, £130 5s 1d., headmistresses, £95, assistant mistresses, £81 12s. 4d.; expenditure per scholar in average attendance, £3 13s 2½d. (1910) *Higher grade schools* (supplementary, but included above) number, 190; accommodation, 40,505, average on registers, 20,440, average attendance, 21,083. *Higher class schools* receiving grants under regulations for secondary schools: number, 57, average attendance, 10,005, teachers—permanent, 1134, visiting, 225; total grant, £38,170. Total number of higher class schools inspected by the Department, 101. *Examinations* (number of passes) qualifying, 60,683; merit, 16,016, intermediate, 4707; leaving, 1248. *Training of teachers*, junior students, 3831 in 115 centers, senior students, 2017. *Education (Scotland) Fund*, £403,888. Aggregate sum from school rates, £1,567,075, representing 44.5 per cent of aggregate income of school boards, excluding loans for capital charges.

SCOTLAND

Universities — History. — Scotland is well equipped with universities, three of which — St. Andrews, Glasgow, and Aberdeen — were founded in the fifteenth century. Soon after their creation they were provided with colleges, founded as endowments for teachers in the universities — particularly of theology — rather than as endowments for students. From the first, therefore, college teachers were teachers or professors in the university. Gradually the residential college system decayed, although a relic of it was preserved in St. Andrews until 1820. In a restricted sense St. Andrews still retains the ancient college system, since, subject to appeal, the discipline is delegated by the *senatus* to each of the two colleges which, as committees of the *senatus*, meet separately. In Aberdeen and Glasgow, on the other hand, the colleges are completely merged in the universities. These facts had important consequences upon the development of university life in Scotland, not the least being that the expenses of a university education have always been moderate. In general, too, little supervision is exercised by the university over its students outside the lecture room. Medieval customs prevail in the election of the rector by the whole body of students and their voting in "nations" (Glasgow and Aberdeen), as well as in the continuance of the rector elected for a short period, side by side with the chancellor, the head of the university, elected for life. For many years the curriculum was largely medieval in scope, and a system whereby the regent carried his students through the whole course to graduation was in operation. This "ambulatory" regenting system was, indeed, retained in King's College, Aberdeen, until the end of the eighteenth century; only gradually were the professors limited to certain subjects. In consequence the education provided was general rather than special, and the university for long did the work of the upper classes of a good secondary school. In the early years of the last century it was not uncommon to find students enrolling at the age of twelve and even under. No compulsory entrance examination was instituted until 1892. Neither was a compulsory curriculum insisted upon nor graduation considered essential. In 1826, after an interval of 130 years since the previous university commission, an era of royal commissions on universities set in. The reports are interesting, the one beginning with 1830 containing a mass of historical matter relative to the four universities. But reform did not come until the Universities (Scotland) Act of 1858, when curricula were readjusted, new chairs instituted, and King's College and Marischal College united in the University of Aberdeen. But, more than this, the act created a new and, as far as possible, uniform administration for each university. The conduct of affairs was intrusted to three bodies:

SCOTLAND

the *senatus academicus* with the management of the ordinary business, the university court as the court of appeal; and the general council to bring the university into touch with outside public opinion. A second Universities (Scotland) Act was passed in 1889, under the provisions of which the universities are still conducted. By this act a permanent committee, the Scottish universities committee of the privy council, was created and a temporary executive commission appointed to draft ordinances subject to the veto of the Queen-in-council, and to affiliate University College, Dundee, to, and make it form part of, St. Andrews University. After protracted litigation the latter was effected in 1897.

Administration. — Each university is practically autonomous, although there is a restriction in the matter of making new ordinances or modifying existing ones. As it was the intention of the legislature to make the Scottish universities as far as possible uniform, any new ordinance, before becoming operative, must be communicated to the other universities who are entitled to appeal against it. In such a case the matter is brought before the Scottish universities committee. In the recent Arts ordinances, however, there was no appeal to this committee, and the assent of the King-in-council was merely formal. In ordinary circumstances, therefore, this committee has practically little to do, and, as it has no public money to administer, it has no financial control. A species of control to which the universities are subjected, none the less real for having no legal sanction, is that exercised by the Treasury and the Carnegie Trust. Indirectly, of course, the Department, in its control of secondary education and of the leaving certificate examination, has considerable influence upon the universities; the raising of the standard of secondary education has not been without important effects upon the standard of work in them.

Within the university itself the governing bodies are the university court, the *senatus*, and the general council, the broad functions of which have been indicated above. The university court, the supreme governing body, is a body corporate with perpetual succession and a common seal, and charged with the possession and administration of the whole revenue and property of the university. It consists of the rector, who presides, the principal or principals, municipal representatives, assessors comprising a nominee of the chancellor and the rector, respectively, and representatives from the general council and the *senatus academicus*. It is the court of appeal from the *senatus*; effects improvement in the internal arrangements of the university, and requires due attention on the part of the professors to their duties — which it can define. Furthermore, it can deprive a professor of his office, subject to the approval of the

King-in-council; it appoints examiners and lecturers, and professors whose chairs are in the patronage of the university; it can found new professorships with the approval of the Scottish universities committee; it regulates the fees in the classes, and it may grant recognition to the teaching of extra-mural colleges for graduation purposes, and, subject to the approval of the King-in-council, it may make ordinances. The senatus academicus, consisting of the principal and professors of the university, the former presiding, regulates and superintends the teaching and discipline of the university, and takes part in the superintendence of university libraries and museums. The general council consists of the chancellor (whom it elects, and who presides), the members of the university court, the professors, and the graduates. Two statutory meetings are held yearly, and the business of the council is to take into consideration questions affecting the well-being and prosperity of the university, and to make representations if necessary to the university court. Two members of parliament are returned by the universities, and are elected by members of this council—Edinburgh and St. Andrews jointly electing one, and Glasgow and Aberdeen, the other. Each university possesses a students' representative council, the constitution of which is subject to the approval of the university court. This council is entitled to petition the senatus, on matters affecting teaching and discipline, and the university court.

Organization.—In their original constitutions the Scottish universities followed continental models, the courses of study being arranged in the four faculties of arts or philosophy, law, medicine, and divinity or theology, which, with the addition of the faculty of science, and, in Edinburgh, the faculty of music (1893), still exist. Entrance upon a course of study in the faculty of arts, of science, or of medicine is granted on passing the relative preliminary examination, which varies somewhat for each faculty and which is regulated and conducted by a joint board of examiners appointed by the university courts. This board, consisting of eight professors or lecturers and eight additional examiners, sits for one year at each university in rotation, the principal of the university where the board meets being *ex officio* chairman for the year. Passes in various other examinations, including the leaving certificate examination, may be accepted *pro tanto* in lieu of passes in the preliminary examination.

The main function of the faculty of arts in the past has been to give students a liberal education in general subjects, the remaining faculties providing professional training. Under the new Arts ordinances it seems not unlikely that this traditional function will be largely modified, and possibly the Arts curriculum may develop into a specialized

course—largely for teachers. Two lines of study are offered—one leading to the ordinary degree (M.A.), the others to the honours degree (M.A.). Three academical years are required for the former—an academical year consisting of at least twenty-five weeks divided into three terms, autumn, spring, summer—and usually four for the latter. For the ordinary degree a large amount of option in the selection of subjects is permitted and to a certain extent specializing is possible. The number of subjects is five as a minimum, of which two must be studied for two academical years. The degree examinations in the latter are on a higher standard than those of the other three subjects. Certain concessions are allowed in respect of cognate subjects. Beyond the M.A. are the degrees of doctor of philosophy (D.Phil.) and doctor of letters (D.Litt.). In the faculty of science, degree courses are offered in various branches—pure science, engineering, agriculture, forestry, and public health—but not in each university. Two degrees are offered, bachelor of science (B.Sc.) and doctor of science (D.Sc.). As some of the subjects for the science degree may be taken as part of the Arts course, it is not unusual for a student to obtain the ordinary M.A. and B.Sc. in practically the same time as would be occupied in taking an honours M.A. degree.

In the faculty of medicine the degree of bachelor of medicine (M.B.) and bachelor of surgery (Ch.B.) must be taken conjointly; one is not conferred without the other, and the minimum time required for the course is five years. Two higher degrees are offered, the doctor of medicine (M.D.) and the master of surgery (Ch.M.). In the faculty of law there are two degree courses—one of two years' duration leading to the degree of bachelor of law (B.L.); the other for graduates in Arts only, covering three academical years and leading to the degree of bachelor of laws (LL.B.). In the faculty of divinity the degree of bachelor of divinity (B.D.) is open to graduates in Arts who have satisfactorily completed a two years' course in theology. Since this faculty in each of the universities is connected with the Established Church, it has been the practice, under certain restrictions, to admit to theological degrees those who, by reason of ecclesiastical differences, have attended recognized extra-mural colleges for courses of divinity. Scotland, it may be added, is well supplied with theological colleges; the United Free Church has training colleges for its clergy in Edinburgh, Glasgow, and Aberdeen; the Free Church, in Edinburgh, the Congregationalists and the Scottish Episcopalians, in Edinburgh; and the Roman Catholics, in Aberdeen. The degrees so far considered are obtained by examination, but in addition, the universities confer, *honoris causa*, the degrees of doctor of laws (LL.D.), doctor of divinity (D.D.), and doctor of music (Mus.D.).

SCOTLAND

Until 1892 Scottish universities could not admit women to academic instruction or graduation. Previous to this, various associations for the higher education of women had been advocating the opening of academic classes to women. In 1877 St. Andrews University instituted the L.L.A. examination. This was followed by the founding of Queen Margaret College, for the higher education of women, in Glasgow in 1883, which, with the passing of the ordinances of 1892 admitting women to the universities, became an organic part of the university.

The Scottish universities are not well endowed. Their funds are derived from bequests, endowments, fees, and grants from parliament and from the Carnegie Trust. For many years they have been assisted by grants direct from the treasury, the annual amount of which was increased to £42,000 in 1889. In 1892 an annual sum of £30,000 was added. The Secretary for Scotland may also consider applications from the university courts and make grants to them out of the Education (Scotland) Fund. A committee was recently appointed (1909) by the treasury to inquire into the financial position of the universities, with the result that an additional sum of £40,000 has been granted.

In 1901 Mr. Andrew Carnegie conveyed to trustees bonds to the value of \$10,000,000, bearing interest at the rate of 5 per cent, and directed that one half of the net revenue should be applied to the expansion and development of Scottish universities, more especially with respect to the faculties of science and medicine, and to provision for the teaching of history, English literature, modern languages, economics, and subjects related to technical and commercial education. Extended facilities were also to be made for scientific study and research. The other half was to be devoted to the payment on certain conditions of the ordinary class fees of students of Scottish birth or extraction attending the university; extra-mural colleges and institutions, providing technical and commercial education up to university level, were not excluded from the benefits of the funds.

Statistics — Matriculated students for winter session (1010-1011) St. Andrews, 501, Glasgow, 2705; Aberdeen, 930, Edinburgh, 3208. Carnegie Trust for period 1901-1908: post-graduate study and research, £40,353; grants to universities and extra-mural colleges, £240,083; payment of class fees, £298,080; number of beneficiaries — men, 6185; women, 2078.

Technical Colleges and Continuation Classes — *History*. — Until the beginning of the present century there was little or no organized system of technical education in Scotland. In Glasgow a scheme of amalgamation of several existing technical institutions came to a head in 1886 when the Glasgow and West of Scotland Technical College was founded. In Edinburgh in the preceding

SCOTLAND

year, with the Watt Institution and School of Arts as a nucleus, the Heriot-Watt College was projected. In Dundee a technical institute was erected in 1887. In addition to these a number of science and art classes, subsidized by the science and art grant, existed in various parts of the country. The Technical Schools (Scotland) Act of 1887, by which school boards were empowered to erect and maintain technical schools, met with practically no response. On the other hand, the town and county councils allotted a fair proportion of a grant, which had come under their administration in 1890, to technical education.

But the first real progress in the reorganization and extension of facilities for technical education began when the Scottish share of the science and art grant, hitherto administered by the Science and Art Department, came under the control of the Scotch Education Department (1897). Within a few years the system under which the grant had been administered was completely reorganized and placed upon a sound educational basis. A clear distinction was drawn between instruction in science and art as part of a general education and as applied to specific industries and employments. A new code of regulations for continuation classes was issued (1901) which, with a few subsequent modifications, broadly covers the elementary technical instruction now given in the country. The grants under this code are derived partly from the science and art grant and partly from the grant formerly given to continuation class instruction.

Administration. — The parliamentary grant for technical instruction is administered by the Department, which, in the continuation class code, or in special minutes applicable to certain central institutions, defines the conditions under which it is distributed. The Department also determines the amount of payments (if any) to be made from the Education (Scotland) Fund to central institutions. It is the duty of a school board to make suitable provision for the instruction of young people above the age of fourteen with reference to the crafts and industries practiced in its district; and in pursuance of this it can provide technical schools or institute technical classes, the management of which may be delegated to special committees comprising, among others, persons skilled in the industries and occupations to which the instruction in the classes has special relation. Under certain limitations the school board may also make by-laws enforcing attendance at a continuation school until the age of seventeen. In addition to the provision made by school boards, there are sixteen central institutions, with governing bodies or managers variously constituted but in general representative of local educational and industrial interests. The local authority, whether a school board or

other body of managers, undertakes full financial responsibility irrespective of any grant which may be given, and only in exceptional cases is the grant greater than three-fourths of the total expenditure recognized as legitimate by the Department. The remaining one-fourth must be provided locally. While this is true in general, central institutions are treated somewhat differently from continuation classes. Grants to the latter depend mainly upon attendance, whereas grants to central institutions, when certain conditions laid down by the Department as to staff, curricula, and examinations for diplomas are complied with, depend mainly upon excess of current expenditure over income, and are usually sufficient to make good any deficiency.

To a certain extent, secondary education committees share in the administration of technical education. They have the power to give bursaries to students to attend central institutions for technical (including agricultural) education. They may also appoint organizers of elementary technical instruction, and provide special teachers to conduct district classes, all with due regard to coordination with central institutions.

Organization.—The scheme outlined in the code of regulations for continuation classes is the basis of the organization. This code groups the instruction in four divisions. Under the head of Division I are placed classes for the completion of a general elementary education, the work of which corresponds generally to the work in the supplementary courses of a primary school. Division II comprises classes for specialized instruction of an elementary nature, such as may be of use to pupils who are engaged in or preparing for any particular trade, occupation, or profession. They are open to all over sixteen years of age. Division III includes organized courses of systematic instruction, arranged with a view to fitting students for the intelligent practice of particular crafts, industries, or occupations. Such courses must, in general, extend over three years at least, and may be classified as commercial and literary, art and art crafts, engineering, naval architecture, navigation, architecture, building, and allied trades, textile industries, chemical industries, etc. A course is graded as preparatory, first year, second year, and so on, and the conditions of direct admission to each year are defined in relation to the existing courses in primary, intermediate, and secondary schools. Within the provinces of the central institutions, the various Division III courses are linked on to the central courses, and whenever the distance, transport, and other conditions are favorable, arrangements are made whereby the students shall continue their studies at the corresponding central institution. Elsewhere, if proper laboratory and other equipment is available, some one

or more courses may be allowed in which, not infrequently, instruction of an advanced character is provided. Of the sixteen central institutions, three provide instruction in agriculture—Aberdeen and North of Scotland College of Agriculture, Edinburgh and East of Scotland College of Agriculture, and the West of Scotland Agricultural College. These colleges *inter alia* conduct day and evening classes, extension lectures, and experimental farms, and provide advisory departments. Each, too, offers a diploma course, and, in conjunction with the university, a course leading to the degree of B.Sc. in agriculture. The Technical Colleges of Aberdeen, Edinburgh, Dundee, and Glasgow offer advanced work in a great variety of industrial pursuits. In recent years extensive additions have been made to the Technical Colleges in Edinburgh and Glasgow, both of which are highly staffed and excellently equipped. Diploma courses are offered in both, the latter granting diplomas in civil engineering, mechanical engineering, electrical engineering, mining, naval architecture, chemistry, metallurgy, mathematics and physics, building, textile manufacture, and, in conjunction with the school of art, architecture. Parts of the work in the Technical Colleges of Glasgow and Edinburgh are recognized by the universities as qualifying for their B.Sc. degrees. Recently a new and well-planned Technical College has been erected in Dundee. Three central institutions in Edinburgh, Glasgow, and Aberdeen, respectively, are organized as colleges or schools of art, and provide full diploma courses. The Edinburgh College of Art is an extensive building of quite recent erection. Two central institutions, the Edinburgh Royal (Dick) Veterinary College and the Glasgow Veterinary College, make effective provision in their special branches of study. Colleges for domestic science exist in Edinburgh, Glasgow, and Aberdeen, while the Dunfermline College of Hygiene and Physical Training, the Glasgow Athenaeum Commercial College, and the Leith Nautical College give adequate training in their respective departments.

J. S.

Statistics (1909-1910).—Central Institutions: number of students—day, 4671; evening, 12,178; total grant from Department, £74,005. Continuation Classes: number of centers, 1055; number of individual pupils, Division I, 25,821; Division II, 70,067; Division III, 22,653; Division IV, 9002; grand total, 127,637; total grant from the Department, £110,100.

SEAMANSHIP, THE TRAINING FOR. — Great Britain. — It was from the side of mathematics that the first instruction in subjects connected with seamanship came. In 1496 John Müller of Königsberg (Regiomontanus) printed at Venice a Latin epitome of the *Megalē Sýnaxis* of Ptolemy, and published the first printed almanac. Martin Behaim, who had been trained mathematically by Müller, went to Portugal and traveled to the mouth of the Congo in 1484. He gave himself up to seamanship, and left behind him maps and a globe, on his death in 1500. He had shown how to use the astrolabe for taking the altitude of the sun. The Spaniards were the first to organize instruction in seamanship by the appointment of a cosmographer to the Council of the Indies, who not only was required to prepare maps and tables for navigation, but also to give to voyagers courses of instruction in arithmetic and astronomy, Euclid, and trigonometry, as well as in the use of the astrolabe and the globes and in the use of other astronomical instruments. This

SEAMANSHIP

instruction was given in Seville, and led to the publication of naval textbooks, particularly that of Enciso as early as 1519. The Dutch followed the Spanish example, and trained their master mariners. Gerard Mercator and Abraham Ortelius produced wonderful maps, and Coignet wrote a textbook on the subject of navigation. English navigators used translations of the naval textbooks of other nations, chiefly those of Spain, until William Bourne in 1573 wrote one in English. Others followed quickly, e.g. Robert Tanner, in 1587, *A Sure Safely for Sailors*, and Thomas Blundeville, *A Briefe Description of universal mappes and cardes, and of their use, and also the use of Ptolemy his tables, etc.*, in 1584, and also his *Exercises*, containing six treatises "verie necessarie to be read and learned by all young Gentlemen that . . . are desirous to have knowledge as well in Cosmographie, Astronomie, and Geographie as well as in the Art of Navigation," 1594 (also 1597, 1613, 1622, 1636). John Davis, the discoverer of Davis's Strait, wrote (in 1594) *The Seaman's Secrets*. Further reference books on navigation up to the middle of the seventeenth century are given in William London's (*q.v.*) *Catalogue of the most Vendible Books, 1658-1660*.

Richard Hakluyt (*q.v.*), preacher and sometime student of Christ Church, Oxford, who wrote the *Principal Navigations, Voyages, Traffiques, and Discoveries of the English Nation, etc.* in 1589, says in the Epistle Dedicatory to Walsingham: "When I was removed to Christ Church in Oxford, my exercises of duty first performed, by degrees I read over whatsoever printed or written discoveries and voyages I found extant either in the Greek, Latin, Italian, Spanish, Portuguese, French or English languages, and in my public lectures was the first that produced and showed both the old imperfectly composed, and the new lately reformed Maps, Globes, Spheres, and other instruments of this Art for demonstration in the common schools to the singular pleasure, and general contentment of my auditory." Hakluyt pleaded for the training of skillful seamen, a profession requiring, he suggests, the time of "two prenticeships." He continues, "I have greatly wished there were a lecture of Navigation read in this Citie (London), for the banishing of our former gross ignorance in Marine causes." He states that King Henry VIII, following the example of the Emperor Charles V, erected three guilds, one at Deptford, one at Kingston-upon-Hill, and the third at Newcastle-on-Tyne (in 1537) "for the increase of knowledge in his seamen," and he acknowledges the value of the mathematical lectures of Sir Thomas Gresham for "the advancement of Marine causes" (*q.v.*). It must be remembered that Hakluyt was of Dutch origin, but his appeal to Englishmen led in Queen Elizabeth's reign to the foundation

of lectures by Dr Thomas Hood in the house of Sir Thomas Smith, in Gracechurch Street. Edward Wright was lecturer on navigation to the East India Company, and there was a lecture of geography, hydrography, and navigation, read in the chapel of Leadenhall.

In 1672 Sir Humphrey Gilbert (*q.v.*) proposed for the projected Queen Elizabeth's Academy a second mathematician to teach cosmography and astronomy with navigation, at a salary of £66 13s. 4d. In 1615 Sir George Buck, in his *Third University of England*, tells us that the lecture in the chapel of Leadenhall was discontinued (by 1615), but at the same date there was a lecture of cosmography read in the Blackfriars at the house of Adrianus Marius. Buck further mentions the College of Trinity House at Deptford founded by King Henry VIII, which concerned itself with "the better ordering, governing and instructing and disciplining of mariners, pilots, sailors, and other professors and practisers of the arts of hydrography, and navigation." In 1635 Sir Francis Bacon (*q.v.*) in his *Museum Minervæ* says, "The professor of Astronomy shall teach Astronomy, Optics, Navigation, Cosmography." A professor was appointed to the chair of astronomy called Nicholas Pilske, while John Speidell (mentioned below), the professor of geometry, had been teacher of navigation also.

In 1673 the first permanent school of naval training was established in connection with Christ's Hospital — the so-called Mathematical School. Forty boys from the Hospital were chosen for their arithmetical and other knowledge to be taught and instructed in the "art of Navigation and the whole science of arithmetic." The master of the Trinity House was then to judge as to the time when such boys could be initiated into the practices of navigation and to be bound out as apprentices for seven years to some captains or commanders of ships. The Trinity House at Deptford Strand was a gild, incorporated in 1520, which controlled the relations between land and sea — for instance, took over public lighthouses, when they were instituted. They had also the binding and enrolling of apprentices to the sea; the examining of mathematical masters for the navy was also in their hands. Apparently Charles II took the idea of naval schools from Louis XIV, King of France, just as the Elizabethan writers followed the example of the Spanish writers. In 1688, Henry Stone, of Skellingthorpe, near Lincoln, gave an endowment to this "royal foundation" for arithmetic and navigation. Samuel Pepys, secretary to the admiralty, and Sir Isaac Newton both showed practical interest in this school. The East India Company was the service into which most of the boys entered.

In 1695 Greenwich Hospital was founded by letters patent from King William III, as

a hospital for seamen, their widows and children. In 1715 a school was opened in the Hospital, where it was ordered that "ten boys should be instructed in reading, writing, and navigation by Mr Weston, mathematical master in the town of Greenwich, and be put out apprentices to masters of ships or others." In 1710 rules were drawn up for the admission, maintenance, and education of the sons of seamen. In 1713 there were 60 boys; in 1789, 150 boys. In 1869 Greenwich Hospital ceased to be an asylum for seamen and the buildings were handed over to the purposes of a Royal Naval College — opened in 1873, for the purpose of providing for the education of naval officers of all ranks above that of midshipman in all branches of theoretical and scientific study bearing upon their profession. Besides navy officers there are officers of the Royal Marine Artillery, Royal Marine Light Infantry and Naval Engineers, and a limited number of apprentices selected annually by competitive examinations from the royal dockyards. Officers of the mercantile marine, and private students of naval architecture and marine engineering by special permission, are admitted to the classes. The Royal Hospital School at Greenwich is still continued. The navigation school founded by the Society of Merchant Venturers at Bristol in 1738 has developed into the Merchant Venturers' Technical College, and includes a preparatory school and secondary day school for boys. The college prepares engineers of all kinds, surveyors, architects, etc., and is not confined to naval instruction. There were navigation schools founded by the Trinity House Corporation at Newcastle-on-Tyne in 1712 and at Hull in 1785. But besides these specific navigation schools, the numerous blue-coat and other colored-coat schools which sprang up in the seventeenth and eighteenth centuries, imitating Christ's Hospital School, in some cases trained the brighter boys for the navy. Thus in 1700, the master of the Grey Coat School, Westminster, was instructed to train picked boys in arithmetic and navigation. This was more frequent in coast than in inland towns. Thus at Plymouth Workhouse, an act of parliament of 1707 required the schoolmaster "to teach such as have a capacity and inclination to learn the art of navigation and such part of the mathematics as tend thereunto." Of private schools where navigation was taught there are the instances of John Speidall in Queen Street, London, 1628; Robert Hartwell, in Fetter Lane, in 1630, and John Kelsey in Covent Garden in 1650. There is at least one instance of a grammar school, viz. Woodbridge (Suffolk), the statutes of which in 1602 require the boys to be "fitted for trades or to go to sea."

Amongst the advocates of naval training must be named Sir Thomas Gresham, who in 1675 required his astronomy professor "to read the

principles of the sphere and the theories of the planets" and to explain the use of common instruments "for the capacity of mariners" and "to apply his subject to the art of navigation." He was followed by Sir Henry Savile (*q.v.*), who, in the statutes for the chair of astronomy at Oxford (1619), requires the professor to explain the whole science of optics, gnomonics, geography, and the rules of navigation, in so far as they are dependent on mathematics.

Sir Clements R. Markham states that in 1641 Sir William Monson renewed the appeals of Hakluyt for the establishment of a lecture on navigation. In 1644 John Milton (*q.v.*) in the *Tractate* made the interesting suggestion that students in the spring weather "sometimes taking sea as far as to our navy, should learn there also what they can in the practical knowledge of sailing and of sea-fight."

In 1705 Lewis Maidwell (*q.v.*) issued *An Essay upon the Necessity and Excellency of Education, with an Account of Erecting the Royal Mathematical School . . . Upon a Report from the Navy Board, Declaring amongst other Advantages to the Nation, the Particular Services of such a Foundation to the Royal Navy of England in its General Capacities*. This book gives an extensive syllabus of proposed naval instruction. Maidwell also wrote *Proposals revised of establishing and supporting a public school designed . . . for the sea-service of the nation without any public charge* (1699). Much more practical was Jonas Hanway, the inventor of the umbrella, who was the chief founder in 1756 of the Marine Society, whose object was to keep up a supply of seamen for the navy. In 1762 the society had been instrumental in fitting out 5451 boys for naval service. In 1783 Hanway suggested further organization of boys for the naval service by his *Proposal for County Naval free schools to be built on waste lands, giving such effectual instruction to poor boys as may nurse them for the sea-service*. In 1772 the Marine Society was incorporated by act of parliament and in 1786 a ship was procured and boys placed in it for training under an officer of the navy and a schoolmaster. Boys after training went into the king's service and into the East India Company.

At the beginning of the nineteenth century David Morrice wrote the *Young Midshipman's Instructor, with useful hints to parents of sea youth, and to captains and schoolmasters in the Royal Navy*, in which he tells us that the schoolmasters in the navy at that time chiefly were provided from Christ's Hospital and that "drinking is too common" amongst them. Directions are given as to the special duties of the navy schoolmasters. Distinctively naval "academies" on land had grown up—one in Soho Square and another at

Chelsen, under William Gairard, who wrote *The Sea-man's Preceptor* in 1802.

In 1856 inspection of the Greenwich Hospital schools, the Royal Dockyard schools and the schools of the Royal Marines was passed over to the charge of the inspectors of the board of education, to report upon them. There are fourteen head schoolmasters, one in each gunnery and torpedo ship and in each of the training ships, and seventy-three naval schoolmasters. In ships with many midshipmen, there is provision of a naval instructor, who is often the chaplain. There are five schools on land for children of marines, and schoolmasters at the naval prisons, at Lewes and Bodmin. The colleges for naval cadets are the Royal Naval Colleges of Greenwich, Dartmouth, Osborne. (See NAVAL EDUCATION.)

With regard to the mercantile marine it is only within the last half century that naval training for officers has been specially provided for, whilst the training of the poor boy has, as an able-bodied seaman, been considered at any rate since the time of Hanway. His Marine Society provided a complete sea outfit for boys and men. In 1786 the society began to give preliminary training in the *Beatty*, and this training has continued till the present day, when the society's ship is the *Warspite*. The society has prepared for sea 66,200 boys, apprenticed to sea life for two years, in which they also receive school instruction, recognized by the board of education as a day technical school. Similarly, the National Refuges for Homeless and Destitute Children (incorporated 1904) established a training ship, the *Arcthusa*, stationed off Greenwich. Other training ships are (1) *The Indefatigable*, New Ferry, Birkenhead, established by Liverpool, in 1865, with a hostel for the sailors on their return from sea. (2) *The Glia*, Bangor, North Wales, of the North Wales, Chester, and Border Counties Training Ship Society. (3) *The Formidable*, of the National Nautical Society at Bristol, a land establishment, and (4) the industrial school ships for homeless and destitute boys, who may be sent voluntarily by parents or by a magistrate's order, but they must be boys who have not been convicted of crime, the reformatory ships being designed for the latter. The industrial school ships include the *Wellesley*, North Shields; *Mount Edgcumbe*, Saltash, Plymouth; *Southampton*, Hull, the *Empress*, Glasgow, *Mars*, Newport, *Fife*. Boys of a wealthier class of parents are trained for both the royal navy and the merchant service in the naval school training ship *Mercury*, in the River Hamble, Southampton Water, a very complete establishment. Finally, there is also a poor law training ship maintained by the Metropolitan Asylum Board, established in 1870, the *Essexmouth*, off Grays, Essex. Of shore establishments the Lanca-

SEAMANSHIP

shire Navy League has a Sea Training Home for boys at Liscard, Cheshire, and Dr. Barnardo's organization has the Watts' Naval Training School at Elmham, Norfolk. The reformatory ships are the *Conwall* off Purfleet, Essex, and the *Alba* at Liverpool. In connection with the latter, there is a shore school, the Heswell (Cheshire) Nautical School. The cadet training ships, for those who take to the sea, with a view of training for becoming officers in the mercantile marine, include, (1) sea-going training ships, viz. the *Port Jackson*, the *Medway*, under the Devitt and Moore's Ocean Training Ship's Company, Ltd; and the White Star Line training ship *Mersey*, and (2) stationary ships, e.g. the *Worcester* off Greenhithe, Kent, belonging to the Incorporated Thames Nautical Training College (established 1862), the *Conway* off Rock Ferry, Birkenhead, belonging to the Mercantile Marine Service Association of Liverpool. In these schools are taught theoretical and practical seamanship in all branches. Apart from training ships, there remains the method of apprenticeship, in the indentures of which the master of the vessel undertakes to teach the boys the duties of seamanship, but this method not being systematized, the results are very uncertain.

A movement has recently taken place in the direction of including naval science in the work of some of the universities. In the University of Glasgow there is a chair in naval architecture; the courses comprise a junior course of lectures and examinations upon naval architecture and marine engine and boiler design and a senior course of instruction in ship drawing, calculations, and marine engine drawing and design, these subjects receiving due place in the applied science degrees in engineering. In the University of Liverpool, the courses in naval architecture include shipbuilding and laying off, ship construction, ship calculations, strength of ships, resistance and propulsions of ships' stability, oscillations and vibrations of ships, design of a ship.

At the Armstrong College, Newcastle-on-Tyne, there is a professor of naval architecture, and two scholarships are offered, of £50 a year, one by the Shipwright's Company and one by the Committee of Lloyd's Register of £50 a year for naval architecture, awarded in the University of Liverpool. F. W.

SECONDARY EDUCATION

tional Condition of Seamen and Marines and the Working of Elementary Schools under the Admiralty, (1883).

Memorandum dealing with Entry, Training and Employment of Officers and Men of the Royal Navy and of the Royal Marines Admiralty. (London, Dec. 1902).

PEARCE, E. H. *Annals of Christ's Hospital, The Mathematical School*, pp. 90-131. (London, 1901.)

SEARS, BARNAS (1802-1880) — Secretary of the State Board of Education of Massachusetts (state superintendent of public instruction); was graduated from Brown University in 1825. He was professor at Hamilton College (1829-1833) and at the Newton Theological Seminary (1830-1842). He succeeded Horace Mann (*q.v.*) as secretary of the Massachusetts state board of education in 1848. From 1855 to 1867 he was president of Brown University, and from 1867 to 1880 he had charge of the Peabody Education Fund (*q.v.*). His publications include *Prussian Mode of Instruction in Latin*; *Life of Martin Luther*, and numerous reports and papers on education. W. S. M.

SECONDARY EDUCATION. — A term used to denote a type of education which follows that given in elementary schools. It may be defined in terms of the age of the pupils received. According to the *Regulations for Secondary Schools* issued by the English board of education a secondary school is one which makes provision for pupils between the ages of twelve and seventeen. As a matter of fact, however, many schools retain their pupils to the age of nineteen, that is, until they are prepared to enter the university. Hence a lower and a higher form of secondary education must be distinguished, the one preparing pupils for skilled trades, for commercial pursuits, or for the minor professions, the other preparing for the universities and the higher professions. A third distinction may further be made according to the differentiation in the curriculum. While a general cultural and liberalizing element must be common to both the lower and the higher secondary schools, there is broader scope for specialization and intensification according to the future career of the pupils. While the term "secondary education" has a fairly clear connotation, the term "secondary school" in England is somewhat anomalous, since so many institutions of this type receive pupils of elementary school age. According to the

SECRET FRATERNITIES

Regulations, however, only pupils between the ages of twelve and seventeen are recognized for the purposes of the grant.

For further details on secondary education see under the various national systems, *e.g.* ENGLAND, EDUCATION IN; FRANCE, EDUCATION IN; GERMANY, EDUCATION IN; and under the terms used in the different countries for this form of education, *e.g.* ACADEMY, FEES, FREE SCHOOLS; GRAMMAR SCHOOLS, GYMNASIUM; HIGH SCHOOL, HIGH SCHOOLS IN THE UNITED STATES, PUBLIC SCHOOL. For the curriculum, see under the different school subjects, *e.g.* ALGEBRA; GEOGRAPHY, GEOMETRY; GREEK, HISTORY; LATIN; LIBERAL ARTS, SEVEN. See also ATHLETICS; COLLEGE REQUIREMENTS FOR ADMISSION; FAGGING, HIGH SCHOOL FRATERNITIES; PREFECT, etc

SECRET FRATERNITIES IN THE HIGH SCHOOL.—See HIGH SCHOOL FRATERNITIES.

SECRETARIAL PROFESSION, HISTORY OF THE—England—Du Cange gives the date of the first use of *Secretaries*, as equivalent to the modern secretary, in 1340. In the ecclesiastical use, the word was employed much earlier—the *secretarius* being one who took charge of the *secreta* of the Sacristy. There is an instance of the modern use of the term in the Court of King Humbert II and in England of a John Maunsell as "Secretarius noster" in the reign of King Henry III. The king's secretaries were formerly termed the king's *clerks*, *notaries*, and *regi a commentariis*. The earliest use of the term *secretary* in the court, was with respect to such as, being near the king's person, received his commands and were called *clerks of the secret*, whence came the court use of secretary. Then the great lords, following the king's custom, came to give their clerks the name of secretary. The king's secretary was called distinctly "secretary of the commands." The term "secretary of state" is said to have come first from Spain, it was assumed by the French, and thence passed into recognized English use in King Henry VIII's time.

In the seventeenth century Richard Braithwait (*q.v.*) "set down *Some Rules and Orders for the Government of the House of an Earle*," and devotes a section to the qualifications of a secretary to a lord. He should be a University man who has studied logic, rhetoric, Latin, and Greek. But he is also to know the Italian, French, and Spanish, with other languages, which he should be able both to speak and to write. He is to be "very secret," and to keep a closet with "cubbardes of drawing boxes and shelves in which to stow away all letters received from the King's Majesty," etc. The secretary's *status* is regarded as similar to that of the gentleman of the horse.

The first treatise on the secretary's duties, discussed quite generally, was in 1586, included

SECRETARIAL PROFESSION

in a book entitled *The English Secretarie* by Angel Day, a book mainly concerned with the art of writing epistles and letters "with a declaration of such tropes, figures, and schemes, as either usually or for ornament sake are therein required." Day discusses the parts, place, and office of a secretary. Day requires that the secretary be "well studied" in the Latin tongue. He must have a "quick conceit," and a sound memory. He should be well read in histories and antiquities, and trained in readiness to put himself at the point of view of strangers. The secretary requires birth, education, quality, disposition, conversation, and ability. This recognition of general power and capacity together with practical experience, shown by Angel Day, is precisely the part of the educational ideal so often missing in the treatises specifically treating of education. This form of technical preparation for secretaryship laid down by Day and Braithwait, though intended for the secretary of the individual gentleman or nobleman, was clearly founded upon the characteristics of the noble secretaries who served kings and emperors. If we recall some of the cultured and experienced men who had served as secretaries, we can understand the dignity that attached to the office in the seventeenth century. In the Tudor times, the type of man who acted as king's secretary was that of the most cultivated man with the widest experience and the all-round learning of the age. Thus Andrea Ammonio, of Lucca, had a great reputation as a classical scholar, was the friend of Colet, Grocyne, and Erasmus, and lived at one time with Sir Thomas More, and from 1513-1515 was Latin secretary to King Henry VIII. Richard Pace, the Englishman who succeeded him, c. 1515, as secretary to that monarch was educated at Oxford, and passed on to Padua, Ferrara, and Bologna. Stephen Gardiner, his successor, was a doctor of civil and canon law, Rede's lecturer in the University of Cambridge, tutor to a son of the Duke of Norfolk. He became private secretary to Cardinal Wolsey. He was also an ambassador abroad to the Pope, a commissioner to revise Wolsey's Statutes for Ipswich and Oxford, and in 1529 secretary to the King, Henry VIII—in which position we meet with him in Shakespeare's *King Henry VIII* ("Call Gardiner to me, my new secretary," II 2 116). Peter Vannes, like Ammonio a native of Lucca, was a man of very wide experience and knowledge who became Dean of Salisbury. He was Latin secretary in the latter part of Henry VIII's reign and continued in office under King Edward VI.

It is needless to speak of the wide range of knowledge of affairs and learning shown by Roger Ascham, though as is well known he prided himself on the beauty of his handwriting, and for this reason wrote many official letters from the university between 1532

and 1511, and from 1546 onwards Ascham was secretary to Sir Richard Moryson in Germany and Austria. In 1553 Ascham became Latin secretary to Queen Mary with a salary of £20. He was retained as Latin secretary by Queen Elizabeth in 1558 and had joined with the office that of the Queen's private tutor. Later in Queen Elizabeth's reign Sir Thomas Lake became Latin secretary in 1600 and is said also to have read Latin and French with her. He was a pupil of Saravia (*q.v.*). He had been amanuensis to Sir Francis Walsingham. He was a member of the Elizabethan Society of Antiquaries. Charles I had, from 1623 onwards, as Latin secretary, G. R. Wockherlyn, a native of Stuttgart and student of law at Tübingen. In c. 1643 his title was changed to that of "Secretary for foreign tongues to the joint Committee of the Two Kingdoms." Wockherlyn seems to mark the transition from Latin secretary to the secretaryship for foreign tongues. He was succeeded in this post by John Milton, who brings to a climax this profession of secretaryship as marking a completeness of training in many directions and more nearly approaching the all-round demands of his *Tractate*, probably, for the sixteenth and seventeenth centuries, than any other profession. The post of private secretary to a statesman or diplomat has always remained, since the Tudor times, the best of openings to a political or diplomatic career, and has always required the broadest of training, academic and otherwise. The most promising young parliamentarians in England still attach themselves to Secretaries of State as "Parliamentary private secretaries" (unpaid).

Modern Times — In the increasing complexity and greater activity along business, social, literary, and educational lines to-day, every firm of note, schools, colleges, and institutions of every description, hosts of professional men and women, and many private individuals have found that secretarial help is indispensable. The demand for capable, well-trained secretaries is far greater than the supply, and this condition is likely to prevail for many years to come. It is true that there are many aspirants for such positions, but the inefficiency of so many of these is the despair of an army of employers. Of those who can rise above the mediocre and can satisfactorily meet existing demands there is a serious dearth, a dearth that will be increasingly felt as the need constantly increases.

This secretarial service is not to be confused with the merely clerical help of the ordinary stenographer and typewriter. The latter, at wages from \$5 per week and upwards, needs little else than readiness in taking dictation and deftness in operating a machine. The former, at salaries ranging from \$700 or \$800 a year to many thousands of dollars, requires in addition to clerical ability a higher grade of

intelligence and skill, some acquaintance with the best social usages, a knowledge of accounts, a strong sense of responsibility, and a high degree of taste, judgment, and tact, all enabling the employee to enter into the business and social engagements of the employer, and perhaps to take considerable responsibility and initiative during the employer's absence.

Secretaries are classed as private, social, literary, educational, and office. Perhaps all might be included under the one title, private, yet it is convenient at times to be able to differentiate them by special terms, as one function or another is emphasized. Thus, an office secretary, usually a woman, attends to details of filing, indexing, billing, cataloguing, correspondence, etc., and she may be intrusted with the supervision of from one to perhaps fifty clerks, stenographers, and assistants. An educational secretary is one who does responsible office work in an educational institution, or who superintends private educational enterprises for some philanthropic man or woman. Literary secretaries help ministers, authors, lecturers, etc., by looking up references, reading, and compiling notes. By social secretary is meant a man or woman of exceptional tact and executive ability who is employed to foster, organize, and supervise the social, literary, and recreational activities of some large business or manufacturing enterprise like a department store or a factory. This term social is also coming into frequent use to denote the private secretary employed by a woman of wealth who needs assistance in carrying out social and philanthropic engagements.

Courses of Instruction. — Secretarial training courses are now planned chiefly in the interests of young women, and such courses are offered by a small number of colleges (Simmons, Margaret Morrison at Pittsburgh, and Elmira), by an occasional secondary school, and by a few business schools. Schools of the latter type, with one or two illustrious exceptions, unfortunately cannot be depended on to give adequate secretarial training. This is seen even in the simpler vocation of stenography and typewriting, for their standards of entrance and graduation are so low and their courses are so meager, brief, and mechanical that poor results are the rule. Many young girls, deceived by advertising that is as attractive as it is exaggerated and misleading, are persuaded to enter upon such a course as soon as they have completed the eighth grade of a grammar school or have had a year or two in a high school, and after a short term of work, seldom exceeding five or six months and often much less, they receive their certificates and set forth to seek employment. With a vocabulary so meager that they are entirely lost when confronted with more than the most ordinary English, they fail to give satisfaction and become a drag on the market, throwing in

the meantime the employment departments of the various companies which sell typewriting machines. The pitiable incompetency of these girls, many of them only sixteen or seventeen years old, can be realized only by those who have suffered again and again in attempting to employ them. Similar results are more than likely to follow when these same schools enter the field of training secretaries.

To become a good private secretary it is desirable that the candidate should have at least a four years' high school course, or its equivalent in self-education and experience, and then take special training for from two to four years more. Schools and colleges in framing courses for secretaries should keep several points in mind as follows: In the first place, the curricula should not only meet the needs of young women of culture and ambition who want a vocational course in order to become self-supporting at once, but of those who wish to take a vocational course simply because the necessity might some day arise of becoming self-supporting, or who want merely a finishing course much more practical than those given in so many seminaries for young women, better fitting them for home life, household management, and for social service in connection with church, school, or other institution.

In the second place, the needs of those who may want a private secretary must be considered by the curriculum makers. Thus it is pertinent to ask, what would be expected of young women in the offices of professional men, lawyers, doctors, ministers, and so on, or in business offices, where secretarial, clerical, and library work calls for much greater skill and wider information than is given by the usual courses in typewriting and stenography? What would be expected in a wealthy, cultured home where a secretary is needed by the lady of the house, who is beset with social and philanthropic calls? Or in a family that divides its time between America and Europe? What would be looked for by a church, school, college, or other institution where great diversity of business and educational enterprise calls for exceptionally capable help? Courses answering to these demands are essentially cultural with a strong vocational bent. They aim to bring the student into touch with many things, people, and places, to the end that vision may be broadened, interests quickened, mind be fully stored, and vocabulary enlarged. Emphasis on the latter point is essential.

Personality, too, is a matter of much consequence. Good breeding, quietness of speech and manner, the quality of being close-mouthed and of being intensely loyal are of supreme importance. So are good taste in dress, a sweet and well-modulated voice, habits of promptness, and careful management of one's own personal finances. It is desirable

that a secretary be an acceptable companion and an interesting conversationalist. Social attractiveness counts for much.

In England — Professional recognition has been accorded in the case of the Civil Service, in the case of town clerks, and clerks to municipal and county authorities. An effort has been made to secure professional recognition for other secretaries who satisfy necessary qualifications, by the establishment of an Institute of Secretaries in 1891. A journal was started in 1892, called *The Secretary*. In 1890 and in some later years, courses of lectures were given, followed by examinations, in company law, bookkeeping, mercantile law and political economy. In 1903 the institute received its charter and became known as *The Chartered Institute of Secretaries*. The institute possesses a library and issues a yearbook. Its offices are 65, London Wall E.C. The examinations which it regulates are: I The Preliminary, in subjects of general education, II The Intermediate or Associates' Examination in professional subjects; III The Final or Fellows' Examination in professional subjects. The subjects for No. II are commercial correspondence, including filing and indexing documents, précis, reports and minutes, commercial arithmetic; bookkeeping and accounts; mercantile law or company law, one of the following: (a) political economy; (b) mercantile law or company law, if not taken as above, (c) French, German, Italian, Spanish languages, including an oral examination. No. III repeats very much the same subjects at a higher level.

Courses in the United States. — How closely existing courses meet the ideals set forth above may be seen in the catalogues of secondary and higher institutions that have already entered this field. Thus Simmons College issues a bulletin of thirty-two pages on secretarial studies, announcing entrance requirements at sixteen points, and offering a four-year course for high-school graduates, a one-year course for college graduates, and a two-year condensed course for high school graduates. The B.S. degree is granted for the completion of either of the first two. The four-year course includes an average of twenty-two hours per week for the four years in the following subjects, some of which are electives: *Languages*, English, French, German, Italian, Spanish; *Science*, biology (hygiene), physics; *History*, European, American, economic history of England; *Philosophy and Sociology*, ethics, psychology, child psychology, economics, sociology, philanthropic problems; *Technical*, accounts, business methods, commerce, commercial law, commercial teaching, library and reference cataloguing, shorthand, typewriting.

The Elmira course is as follows: elementary and advanced business law, accounting, shorthand, typewriting, business organization and management, commercial institutions and

SECRETARIAL PROFESSION

transportation, banking and investments, money and credit, standards of living and administration of income, social problems.

A New York school for girls offers the following course as a preparation for either secretarial work or teaching in a private kindergarten. It is equivalent to the regular two-year courses given in the state normal, and city training schools, and presupposes graduation from a high-school course.

	Hours
English. Voice training, articulation, enunciation, phonics, and spelling	80
English. Children's literature, story-telling, interpretative reading	120
English. Composition, business and social correspondence, book review, story writing	120
French and German. Conversation and composition	180
Arithmetic and account keeping	80
Pennmanship and spelling (until proficient)	
Geography. Routes and methods of travel illustrated by stereographs, stenographic, and pictures	80
History. Philosophy and interpretation of ancient, mediæval, and modern	160
Sociology, economics, current events	80
Nature study and woodcraft	80
Interpretative art	80
Interpretative music	80
Household economics, organizing menus, cooking, marketing, setting the table, entertaining guests, chamber work, cleaning, dusting, ventilating, sick room cookery, dietetics	80
Logic	80
Psychology	100
Playground methods, folk dancing, home entertainments	80
Social forms and functions	20
Office theory and practice, stenography, typewriting, library methods	180
Visitation of prominent buildings and places of interest, such as museums, churches, educational and charitable institutions, the great hotels, business centers, playgrounds	60
In certain cases, substitutions for some of the above subjects may be accepted by the school, on consulting with the headmaster	

To many, the work of a private secretary is more congenial than teaching, and to those who are well prepared it will often prove more remunerative. A secretary who can "write a good letter, who can take an employer's idea and carry it out in all its details, look after office accounts, read foreign correspondence, prepare abstracts, consult authorities, and in many cases act as an employer's agent or representative," need never be without a good position. A salary of \$60 to \$80 per month may reasonably be expected, but one must not be misled by the highly colored statements of some secretarial school prospectuses into expecting large salaries. It is true that many a young woman has received \$100 a month, and there are instances of ladies receiving considerably more. But those are very exceptional cases. Yet the fact remains that for those who will take the trouble to make thorough preparation there are excellent possibilities ahead, just as large as they are capable of filling.

F. W. and M. T. S.

SECTARIAN SCHOOLS, AND SECTARIANISM — See **CHURCH SCHOOLS**; **PAROCHIAL SCHOOLS**; also **BIBLE IN PUBLIC SCHOOLS**; **RELIGIOUS EDUCATION**.

SECTION GRANTS FOR EDUCATION — See **NATIONAL GOVERNMENT AND EDUCATION**, **SCHOOL FUNDS**.

SECULAR SCHOOLS. — Those schools, as a rule maintained out of public funds, in which no religious instruction is given; that is to say, the pupils are not taught the tenets or doctrines of any denomination. This does not exclude the teaching of the Bible without comment, as in England. In America, however, the principle has been carried further and secular schools are schools, publicly maintained, in which no religious instruction of any kind is given. In France there has been complete secularization of schools and also in Victoria, Australia.

A GROUP OF AMERICAN EDUCATORS.

SEGUIN

SEGUIN, EDOUARD (1812-1880) — Organizer of schools for feeble-minded children, educated at the colleges of Auxerre and St. Louis (Paris) in France, and studied medicine under the distinguished Itard. He established at Paris in 1839 the first school for the training of feeble-minded children. Seguin came to America in 1848 and took an active part in the organization of schools for the feeble-minded. He represented the United States at the Vienna exposition of 1873, and his *Report on Education* (Milwaukee, 1880) gives an excellent account of the educational exhibits at that exposition. His other publications include *Idiocy and its Treatment by the Physiological Method* (1860), *New Facts and Remarks concerning Idiocy* (1870), *Psychophysiological Training of an Idiotic Eye* (1880), and a half-dozen works published in French on the psychology and pedagogy of the feeble-minded. W. S. M.

See DEFECTIVES, SCHOOLS FOR, MONTESSORI SYSTEM.

SEISMOLOGY — See GEOLOGY.

SELDEN, JOHN (1584-1654). — The scholar of the parliamentarian party of Charles I's reign, was educated at Chichester Grammar School, and at Hart Hall, Oxford. He entered Clifford Inn and the Inner Temple and in 1617 wrote the *History of Tithes*, which was suppressed. Apart from his political career he was the greatest lawyer of the time, as is evidenced by such a work as his *Titles of Honour* (which Hallam described as "amongst the greatest achievements in erudition that any English writer has performed"), embodying profound research into the history and antiquities of both English and foreign countries, 1614. In 1617 he published the *De Deis Syris, Syntagma duo* which placed him in the ranks of the first European scholars of the age; in 1635, *Mare Clausum*; in 1640, *De Jure Naturali*; and in 1647, *Juxta Hebraeos and Fleta*. These works prove that he was also one of the most conspicuous orientalist, Gæcists, and general, as well as legal, scholars of the time.

Educationally, apart from scholarship, Selden's services are mainly connected with the description (1625) of the marbles brought by the Earl of Arundel from Greece in 1624; and with the collection of books in his legal library. The *Marmora Arundelliana sive Sæcæ Græcæ incisæ* describe the marbles variously known as the Arundel, the Oxford, or the Parian, Marbles. In the treatise are included a preface, an apparatus, a *canon chronologicus* and historical notes. The treatise constitutes what Hallam calls "a sort of era in lapidary learning" and helped (together with Archbishop Ussher's work and that of Scaliger) to form a basis for a new chronological science. As to his library, a number of his books went to the

SELF

Inner Temple library, and the rest were given to the University of Oxford, where they were placed in a separate room. Selden's reputation was high throughout Europe, and was dwelt upon by Grotius, Salmasius, Bochart, G. Vossius, Gronovius, and Daniel Heinsius. His indirect influence on education was great. In historical and legal studies, as it has been said, he seems to have been regarded "somewhat in the light of a valuable piece of national property like a museum or a great public library." F. W.

SELECTION, NATURAL. — See ACQUIRED CHARACTERISTICS, EUGENICS, EVOLUTION; HABIT; HEREDITY; INSTINCTS

SELECTION OF TEACHERS. — See TEACHERS, APPOINTMENT OF

SELF — The conception of self reminds one of St. Augustine's saying about time. Everybody knows what it is, but no one can tell. Its connotation is not easy to give satisfactorily, but there is little difficulty in picking out the objects which it denotes. We do not regard sticks and stones as selves, most persons would deny that plants had self-hood, and would ascribe it only doubtfully to animals with the exception, probably, of dogs, horses, and such other animals as have a close relation to man. Three elements seem to be involved in self-hood. The first is capacity for feeling, especially feeling pleasure and pain. The second is the capacity to think of these experiences, to objectify them, as it is usually said. Merely to suffer pains and enjoy pleasures as they come and go, without recollecting them, connecting them with objects as their causes and without making the objects ends of anticipation, desire, and aversion, would hardly mark off a self. The self involves the duration of a center of pains and pleasures through a succession of experiences so that the passing experiences, in spite of their diversity and transitoriness, get referred to one another. These statements do not mean that there is any capacity for feeling pleasures and pains by themselves in isolation from all other qualities, but simply that the traits of objects in virtue of which they affect the well-being of a living creature for good or evil becomes a centralizing and focusing point, with respect to which objects are remembered and anticipated. Thus there is effected a mutual cross reference which is basic to the existence of self-hood. This integration of experiences with one another, effected on the basis of the painful or pleasurable quality of the experiences, constitutes thought in its germinal and basic form. The third and

oulinating element is the social. While the two elements already mentioned would secure a certain massing and ineluctable unification of experiences, they would not constitute self-hood. A contrast is required. When living beings live together under conditions where they have to consult, in directing their experiences and forming their ends, the welfare of others, each is compelled to distinguish others from himself, and, by a correlative process, his own being and aims from those of others. Without the consciousness of *alter*, there can be no consciousness of *ego*, and the more distinct the consciousness of others, the more definite the thought of one's ego. The older notion that one begins with a clear notion of his own self-hood and then proceeds by a process of inferential projection, guided by analogy, to attribute self-hood to others, goes contrary to the facts. The child is treated by others as an end in himself, that is, as a being whose feelings, thoughts, and aims are to be respected and as one who is like his fellows in the claims made upon him, and he accordingly learns to think of himself in the same way. He becomes a self, as he becomes an integrated yet distinct member of an association whose constituent elements have rights and duties with respect to one another. The point comes out clearly in the distinction between two types of selfishness: spontaneous and reflective. Ordinary selfishness does not mean that an individual is consciously thinking of himself and of his own advantage and deliberately preferring his own welfare to that of others. It means rather that he is unconsciously engrossed in certain objects and a certain course of conduct without thinking of its relation either to himself or to others. As others, however, find this course obnoxious to their own welfare, they manifest disapproval and attribute conscious intention. In this way, they tend to make the person relate his action to a conscious center. As a result, deliberate or reflective selfishness and unselfishness become possible.

While, then, self-hood has a natural psychological basis, it is, in its realization, a social and a moral fact. This social and moral quality constitutes its importance from the educational point of view. In tribal societies, the well-being that constitutes the central point of reference in determining and judging conduct is to a large extent that of the group *en masse*, as over against other groups. Self-hood seems to belong to the tribe or clan, rather than to its members. There is correspondingly little sense of distinctive personality or subjectivity. The individual belongs, quite literally, to his group. With the rise of distinctions of superior and inferior, of chieftainship and kingship, a few, the rulers, think of themselves as having a special position, special ends, and a welfare which is to be specially, even uniquely, consulted. They

achieve, in brief, a sense of self-hood. In the Greek city-state, each free citizen was treated, in his capacity of free citizen, as an individual, but self-hood was denied to slaves, serfs, and women, and, except in a latent sense, to children. Even with reference to free individuals, self-hood was not emphasized so much as the duty of subordination to the community interest. Early and medieval Christianity gave a powerful impetus to the sense of individuality, through the introduction of the notion of an eternal well-being or misery, depending upon the relation taken to God through the Church. The social organization remained such a fundamental factor in determining this relationship, however, that the conception of subjectivity still remained undeveloped. Instead of the idea of the self there appeared that of a "soul" which was possessed by all as an individual entity. In Protestantism, the individual became overt, the Church consisted of individuals who had, through direct relationship to God, found salvation, instead of its being the instrumentality by means of which the individual attained salvation. The growth of the principle of subjectivity was also emphasized by political conditions. The conception of the State underwent a change analogous to that of the Church. Instead of being, as in classic thought, prior to the individual, it was made by the free choice and voluntary compact of individuals. The formula of Kant, that every individual is to be treated morally as an end in himself, never as a means to others, is perhaps the first explicit and sweeping statement of the modern principle of the universality of self-hood.

Thus growth of the democratic spirit has modified the conception of childhood. The tendency is to conceive of children as already members of a social whole, in virtue of which they possess rights, instead of having rights merely potentially, in virtue of a future social membership. This conception corresponds to the extraordinarily rapid growth of interest in the education of the young characteristic of the last century. Education is conceived as a public duty which is owed to the young. The conception has also modified, almost transformed, in fact, the discipline of the young, and has affected, though less completely, the methods of teaching. The growing displacement of harsh and punitive discipline by milder methods and by greater regard for personal intelligence, and the disposition to use methods that throw more intellectual responsibility upon the pupil and less, comparatively, upon teacher and text, are practical expressions of the extension of the principle of self-hood of children. It is obvious that the revolution — for it is hardly less than that — brings new dangers and difficulties with its gains. When children are treated in external ways as full-fledged selves, while their power of

SELF ACTIVITY

reflection and the habit of judging from a social point of view are not cultivated, the result is a mere relaxation of external control, without the development of control from within through the formation of a genuine self-hood.

A marked characteristic of the modern conception of the self, as developed by psychologists, is the latitude given to diversity, in contrast with the rigid unity of the older notion. This extends not merely to recognition of specific and inalienable differences of structure and function in different selves, but also to the coexistence of different and ununified tendencies, almost minor selves, in the same person. Because of the dependence of the self upon modes of social treatment, a person who enters into different sets of associations tends to develop selves that are only loosely connected with one another. A child is one person in family life, and another with his fellows upon the street, just as an adult may have one self in business and another at home or in the church. Unity of self is not an original datum, but an achievement. The responsibility of the school in coordinating into an orderly whole the diversity of social tendencies which, in the complexity of contemporary life, tend to dissipate and distinct self-hood, is constantly increasing. Another aspect of the variety of the self is seen in James's distinction of a bodily, a social, and a spiritual self. The influence of reference to well-being may make itself felt in different and only loosely connected fields. Pleasures and pains referred directly to the body tend to build up the thought of the bodily self. The social self (using the term social in a narrower sense than it has been used before in this article) depends upon the thought of the self that is attributed to others—the thought of one's self as reflected in popularity, reputation, esteem by others, etc. (See SELF-CONSCIOUSNESS.) The spiritual self refers to the unification of experiences with reference to some ideal self-hood to which one aspires, or to one's thought of one's self as reflected, not in current esteem, but in the mind of some ideal judge that one imagines to have perfect insight and to pass upon one's character. SELF ACTIVITY. — See ACTIVITY.

SELF-CONSCIOUSNESS — The popular and the philosophic meaning of this term (the latter being derived from the German idealistic philosophy) have nothing in common. In

SELF-CONSCIOUSNESS

idiomatic usage, self-consciousness indicates that attention is given to the thought of one's self which one assumes to be held by others, so that this thought intervenes between the person and effective attention to the object in hand. One is thinking about himself and about others' attitude to himself when he should be thinking about some work or subject matter. Thus the term contains a shade of disparagement. Self-consciousness takes two forms according as it accompanies a pleasurable or a painful idea of self. The first shows itself in showing off, "performing," to attract the notice of others, etc. But to some people the idea that the attention of others is upon them is painful, instead of tickling their vanity; and their self-consciousness manifests itself in shyness, constraint, embarrassment and confusion, when doing things in the presence of others, unless they "forget" themselves. While vanity and timidity are natural biological traits, their transformation into the two types of self-consciousness mentioned is the product of the social environment, being the reflex effect of the way in which others treat a child, especially in "criticizing" him.

There are two considerations intermediate between this popular meaning and the philosophic one noted below. One of these involves a bad or at least doubtful meaning, while the other expresses an important factor in an intelligent life. Both are moral in nature. The first is introspective curiosity concerning the goodness of one's motives, the disposition to think about one's self from the moral point of view. Since this may easily lead to a morbid interest in one's self which is none the less egotistic because concerned with one's goodness or holiness, and because such a morbid interest tends to be paralyzing to frank and generous overt action, self-consciousness in this sense gets the doubtful meaning referred to. The good meaning is associated with the Socratic "Know thyself" as the basis of morals. This does not imply a purely "inner" or introspective knowledge of self, but rather a knowledge of one's proper end, of what one is good for, of the duties and responsibilities through which one enters into such relations to the world and to others as are required to realize one's self.

The recent technical philosophic meaning of self-consciousness comes ultimately from the Kantian philosophy. Kant, in developing his doctrine that knowledge is impossible without the operation of certain functions of thought, was led to insist upon the unity of thought, which accompanied the activity of all the thought functions. Without this reference to a logical unity, the cognitive correlate of the unity of the objective world would be lacking. Kant referred to this ultimate unity as the transcendental ego, and as the "I think" which must accompany all knowing experiences—that is, all ideas of objects as objects

SELF-CONTROL

He insisted, however, upon its merely formal and logical character. He insisted that it was not to be identified with mind, the self, soul, spirit, in any concrete sense. His successors, especially Fichte and Hegel, regarded this restriction as itself illogical and identified self-consciousness with the principle of ultimate unity differentiating, while relating, the objective and the subjective world, physical and mental phenomena. According to the modern Hegelians (Caird, Henry Jones, etc.) self-consciousness is the highest and most complete (or "concrete") of all categories, overcoming the one-sidedness of all purely physical and psychological principles of explanation, by penetrating to a spiritual unity expressed in both. In many writers, like the last named, self-consciousness tends to become a glib term by reference to which all difficulties are disposed of.

J. D.

SELF-CONTROL. — See WILL; also CONDUCT; CONTROL, HABIT; MORAL EDUCATION.

SELF-EDUCATION — A term used to refer to education obtained by an individual by his own efforts without the direction of a school or other educational institution, or of a teacher. While laudable in itself, self-education is defective because, as a rule, it is miscellaneous, undirected, and in the main obtained merely from books and thus excludes the influence of one mind or personality on another. To this extent degrees obtained in non-teaching universities or courses taken by correspondence are of less value than work done under direction and with the help of a teacher.

SELF-GOVERNMENT IN SCHOOLS. — **The Nature of Student Self-government.** — A condition of order or social cooperation is fundamental to effective teaching at school. Hence the discipline of the school or the disciplinary power of the teacher or principal has always been a quality of prime importance in the eyes of a critical public. The result has been that the school has traditionally aimed to obtain an immediate orderliness in the school life, too frequently to the great neglect of the final educative effect of the methods employed. Discipline was then regarded as a necessary evil, not as an educative opportunity. Partly through the pressure of a social opinion which has increased its regard for persons, more particularly for children, and which has criticized the product of the schools in terms of the child's ability for self-control and social cooperation under the stress of actual world life; and partly through the influence of a saner psychology which has gripped the schools, the emphasis has been taken off a type of discipline exclusively for immediate order and placed upon another which gives both personal growth and a lasting effective cooperation at school.

SELF-GOVERNMENT IN SCHOOLS

(For the history of self-government in schools, see PREFECT AND THE PREFECTURAL SYSTEM; also MONITORIAL SYSTEM.)

This new impulse in the management of schools has expressed itself in various attempts to enlarge the freedom, initiative, and responsibility of children in the management of their own activities both in and out of the classroom. Historically this tendency first expressed itself among the most mature school groups. It has long been found in the "honor system" of the colleges and universities, then in plans for pupil self-government in the high schools, and last in the elementary schools. The "honor systems" of the higher schools represent a somewhat different movement from that for "pupil self-government" in the lower schools. As college students have traditionally enjoyed a large measure of liberty and self-control in the management of their athletics and social activities, and, to a considerable degree, of their dormitory life, the official use of student initiative and responsibility has largely attached itself to the examination system where the academic staff has found it difficult to control dishonesty and at the same time insure the development of appropriate attitudes and habits on the part of the students. In some places even the disciplinary authority usually exercised by the faculty and its committees has actually been turned over to committees of the student body for primary handling, this, however, is exceptional. In the public day schools, both secondary and elementary, the teacher's control of all school activities in and out of classes has been more complete and effective, and the liberalization of discipline, once set in motion, has covered all the activities of elementary and high school children, but mainly their extra-schoolroom activities. Thus whereas the evil of cheating has been chiefly responsible for the "honor system" in the colleges, the self-government systems of the lower schools have been the product of two wider influences: (1) The attempt to get a more objective and active teaching of civics, and (2) the effort to make school discipline and government yield growth in the social character of each student. The two systems will need to be discussed separately.

Honor System in Colleges. — The "Honor System" of the colleges aims at dispensing with the vigilant supervision of examinations by teachers and relies on the honesty of the students. In some form, it is found among about a quarter of the American higher schools, more particularly among those in the Southern and Western states. One investigation, receiving 280 replies to questionnaires sent to 350 colleges and universities, shows that about 29 per cent of all American colleges use some sort of honor system. Of this total 44 per cent are situated south of the Mason and Dixon line and east of the Mississippi River.

Only 11 per cent are in New England. Of the honor-system colleges, only about 66 per cent are exclusively for men, 17 per cent exclusively for women and 17 per cent coeducational. As the honor system seems to have been first developed in a notable way at the University of Virginia, a Southern institution exclusively for men, imitation, following the lines of similarity of condition, would explain the distribution as regards geographical location and sex.

There are many variations in the use of the honor system. Some institutions exact no pledge whatever from the students, but repose trust in the student body as a matter of course, expecting honesty to be a normal response, one more likely to be obtained since no special effort is made to watch the students or to exact a formal statement of the students' obligation. Generally speaking, however, some formal pledge is usually exacted with the establishment of the honor system. It may vary from an individual pledge to the instructor accompanying each paper handed in, as at Princeton, to a broad obligation to the faculty assumed by resolution of the student body, wherein the students administer the system through their own committees. Perhaps one half of the colleges exacting some formal pledge go beyond the guarantee of personal honesty and provide for some form of reporting the dishonesty of students. In this somewhat extreme practice, the student pledges himself both to be honest himself and to report any cheating that comes to his knowledge. The report is usually confidential and is made to the president, the faculty, or a student committee.

It is difficult to evaluate the "honor system" in comparison with the method of supervised examinations, and still more to determine which of the various methods used in applying the honor-system seems intrinsically the best. Experience shows such widely divergent results, that honesty seems to be more a matter of institutional morals than of a particular system. Investigation shows that the university students of England and Scotland, though subject to strict supervision at their examinations, would regard any dishonesty as debasing, an act not to be condoned. Again, some institutions that have attempted the honor system have returned to the method of supervised examinations because the morale requisite to sustain the system has not been sufficiently powerful or stable. The attitude of loyalty to one's associates is often too powerful to be overcome by any obligation to report a discrepancy. Hence, the system has often failed to attain the ends which have been the special arguments for its use. It is probable that other factors besides the system itself are more important, such as the traditions of the school, the relations of faculty and students, and the concrete manner in which the method is administered. In any

case, the chief function of the authorities should be to develop a proper institutional morale with such gradual modifications in the system of supervision and personal responsibility as will give a system that will organize the best stable attitude of the student body without subjecting individuals to a moral overpressure or a confusion which would bring the system under suspicion and dispute.

Self-government in Schools.—The influences which have operated toward the introduction of an increased degree of self-government in the public schools are numerous. They have touched the elementary and secondary schools at several points with different emphasis and effort. The movement which is found in the high school and the grammar grades of the elementary school apparently originated in an effort to make classroom teaching of civil government more effective through an active objectification by the children. It was at first a kind of mimicry of governmental forms, a temporary device of teaching, restricted to the classroom. Later, partly to add a deeper sense of reality and partly to develop the character requisite to self-government, it was applied to the life of the school outside the classroom. Hence, the device for self-government became the school city or the school state, the machinery of government used by the American state or municipality being somewhat modified to meet the simpler needs of school life. In most cases the official system took the form of a school city, with a mayor and other executive officers, police, health department, common council, justices, etc. Less frequently the simpler tripartite system of the state with its executive, legislative, and judicial branches was installed as a school state. Undoubtedly the device was more or less effective as a means of instruction, but the unwieldy governmental machinery, the product of a vastly different social group and life, became an impediment to real self-government by the children. When the attractiveness of the system as a novel and playful mimicry had passed, interest disappeared, and a point of diminishing educational returns was reached. However, the effect of the experiment proved the value of some measure of self-government among children. Training in self-control and a right attitude towards one's fellows became a dominant purpose, and instruction in civil government returned to the classroom. This modification of the aims of the school city led to a simplification of the machinery of government, until, with a simple series of class tribunes and weekly elections and a few other simple governmental devices, the machinery of self-government approximated the needs of the social life of children at school. The result was an enlarged success, and an extension of the use of pupil self-government among schools. It

SELF-GOVERNMENT IN SCHOOLS

has an undoubted value in developing in real social situations the elements of personal self-control, right reverences, and tolerances for the other children, a respect for law and authority, and a sense of the worth of order and cooperation as a basis for work and achievement. More particularly where play and sociability are fostered so that children have increased contacts, desires, and therefore enlarged needs for cooperation, the use of an appropriate system of self-government affords a practical laboratory for dealing with human affairs. Out of the multitudinous number of concrete human problems that children learn by experience to master, they gradually acquire ideals for self-control and the management of others which are highly useful in adult social life. It must not be assumed, however, that such desirable results come just through exposure to situation and machinery. A system of pupil self-government does not relieve the principal and the teaching staff of the responsibility for discipline, it increases it, for under this new conception the governmental process must not only develop immediate social order, but must at the same time be an educative process. The teacher's function has merely to be exercised in a new way. Where before governing was chiefly "disciplining," that is, a direct personal correction of maladjustments, now it has become a complicated and indirect means of preventing school offenses or breaches of good order. And every effort of such indirect influence and supervision must take account of individuals so that personal growth as well as cooperation is assured.

In the lowest elementary grades, the liberalizing of school government has come in a far different way. Not the institutional ideals of adult politics, but those borrowed from the home have been effective in kindergarten and primary grades. The old authoritative and more or less ascetic rendering of discipline has passed before the new maternal attitude of the teachers. The formal silence and obedience and the rigid military movements of the older schools have disappeared, and the freedom and informality which characterize the life of children in the best homes have entered in their stead. The kindergarten has been largely responsible for this more kindly and free spirit of life in the lowest elementary grades. The new psychology and child study have reinforced the belief in a method which tolerates individuality, generates initiative, and looks to the natural checks of social circumstance to develop responsibility among children in action. But this system of ideals borrowed largely from the household has had its frailties, too, though they have not been so conspicuous or far reaching as those of the school city and the school state. The freedom of children has tended to become license; at least the slighter opportunities,

no less important because they are slighter, of training children into cooperation with each other and with the reasonable authority of the school, have not been fully utilized by the more ardent apostles of freedom and self-activity in the primary school.

In general, the movement for self-government among the pupils of the schools has meant a clear gain. It has converted discipline from a stern and regrettable necessity into one of the school's richest educative opportunities. While it is well to note the fact that the school is a transient institutional life for the child, one that prepares for something else, it is nevertheless necessary to emphasize the truth that it is a real existence with limiting conditions of its own. The method of school government must take this into account. The school, on the one hand, is not a city or a state; on the other, it is not a home. One asks too much and the other too little. The school is itself, and an extremely varied self the child finds it as he proceeds from kindergarten to the university. The spirit, method, and machinery of government must therefore fit the conditions. Age, sex, the school traditions, the personality of the teachers, the attitude of the community from which the children come and the ultimate social conditions and ideals to be served, — each of these should affect the structure and method of school government.

SEMICIRCULAR CANALS. — See DIZZINESS; EARN.

SEMINAR — A term employed originally in Germany to denote a group of advanced students in the universities, directed by professors for purposes of investigation or research or of introduction into the methods of research. It is probable that the use of the word in this sense was popularized by Francke who at the beginning of the eighteenth century established the *Seminarium preceptorum* — a training school for teachers. The introduction of the seminar into the university is credited to J. M. Gesner (q.v.) who in 1737 established at Göttingen a philosophical seminar to train theologians for the teaching profession. Academic pedagogy, and practical work was done. The seminar continued under Heyne (q.v.) who trained so many classical scholars. Its further development took place under F. A. Wolf at Halle where, although

appointed professor of philology and pedagogy, he concentrated his attention on the philological seminar (1878). In the nineteenth century the seminars in Germany have become the "nurseries of scientific research." Some seminars have received special endowments and equipment in the form of libraries and laboratories, and here the professors with their assistants and students carry on the work of special investigation. More especially is the dissertation work of the students conducted in the seminar and subjected step by step to the criticism of professors and students. As an introduction to the work of the seminar, proseminars have been established for younger students.

The seminar method was strongly advocated by students who returned from German universities, and was introduced into America in 1871-1872 when Professor Charles K. Adams (*q.v.*) adopted it in some of his history classes at the University of Michigan (*q.v.*). "A seminar," he said, "according to the German idea, is a small group of advanced students carrying on investigations of an original nature under the general guidance of their instructor." The seminar method has remained a part of the university or post-graduate work since the foundation of Johns Hopkins University (*q.v.*) in 1870 and the general impetus then given to the provision of post-graduate studies.

For the seminar as a training school for teachers (*Pädagogisches Seminar* for secondary school teachers, and *Volksschullehrerseminar* for elementary school teachers), see GERMANY, EDUCATION IN.

See UNIVERSITIES; also EXPERIMENTATION, RESEARCH.

SEMINARY GRANTS.—Beginning with the admission of Ohio to the Union in 1802, and continued in the case of all new states since that time, Congress has given to each state two, and to a few states more than two, sections of land (46,080 acres) for the endowment of a seminary or a university of learning. In the case of the states admitted beginning with 1889, still larger grants for university purposes have been made. The early grants were long known as the Seminary Grants, and the fund created from the sale of the land was known as the Seminary Fund. Within recent decades the term seminary has been dropped, and university used instead. E. P. C.

See NATIONAL GOVERNMENT AND EDUCATION.

SEMITIC EDUCATION.—See JEWISH EDUCATION.

SEMITIC LANGUAGE AND LITERATURE—See ORIENTAL LANGUAGE AND LITERATURE.

SEMLER, CHRISTOPHER (1669-1740).—Founder of the first German *Realschule*,

was born in Halle, studied at the universities of Leipzig and Jena, and became (1697) a lecturer at the University of Halle. Two years later he became also a pastor and superintendent of elementary schools in his native city.

Semler was intensely interested in mathematics, astronomy, physics, and mechanics. He made many useful inventions and spent much time and money in making apparatus and experiments. In 1708 he opened a school for future artisans, which he called "a mathematical and mechanical real-school," because its object was the study of real things, by which he meant scientific and mechanical instruments, animals, plants, and minerals, chemical apparatus, tools, etc. The school was merely supplementary to the ordinary schools, the course being only two hours a week. For some reason the school was given up after about three years and, although it was revived by Semler in 1737, it soon ceased to exist, probably on account of the death of its founder, which occurred in the following year. Still, in spite of these small and crude beginnings, the idea survived, was taken up by Hecker (*q.v.*) in Berlin, and from it has sprung the vast system of "real," industrial, trade, and continuation schools which we find in Germany at the present day. F. M.

SENECA, LUCIUS ANNÆUS († B.C.—65 A.D.).—The celebrated Roman Stoic philosopher and statesman, was the son of an eminent Spanish rhetorician, under whose care he received a liberal education at Rome. He was successful as an orator and rose to high office under the Emperor Claudius. Accused of an intrigue with a member of the royal family, he spent eight years in exile in Corsica, where he sought consolation in philosophy. He was recalled to Rome, held the offices of praetor and consul, and amassed a princely fortune. He became the confidential adviser of the Empress and was entrusted with the education of her son, the future Emperor Nero. This was his chief experience as an educator, and the excellence of Nero's early life was no doubt due to his training, although he proved unable later on to control the depraved passions of his royal pupil.

Seneca was the most eminent Latin writer of the Silver Age and was master of a polished and epigrammatic style. His writings were mainly on moral subjects. Most of them are in fact Stoic sermons, dealing with practical questions of personal conduct. His *Moral Letters* form one of the most important ethical treatises of antiquity and are still widely read and studied. His ten *Tragedies* were never acted, but their influence upon the development of the French drama was considerable. Scattered through his *Letters to Lucilius* are many valuable pedagogical precepts. He strove to direct education to practical ends and urged

SENEGAL

that a multiplicity of studies should be avoided and thorough work in short compass insisted upon. Some of his sayings, such as the following, have become proverbial "The best method of being taught is to teach." "The end is attained sooner by example than by precept." "We should learn, not for the sake of school, but for the great uses of life" His conviction as to the wisdom of profoundly studying a single book was expressed in the saying, "I fear (i.e. have a wholesome respect for) the man of one book." W. R.

SENEGAL. — See FRENCH COLONIES, EDUCATION IN

SENESCENCE — The general decline in mental and nervous powers which accompanies old age. There is a general decline in the keenness of the senses, in motor powers, and in the power of retaining new impressions. Memory commonly shows a loss of all of those experiences which have been recently acquired. There is a tendency to return to the experience of early youth C. H. J.

SENSATION. — A sensation is a simple element of experience which arises through the excitation of some organ of sense. Thus, the experience of red which one receives through the excitation of the retina is a simple visual sensation. The sensation which is received through the ear from a vibrating string or rod is a sensation of sound. Sensations are classified according to the organs through which they are received. The popular classification into five types of sensations is technically to be increased by the addition of certain classes of sensations not commonly recognized, such as organic sensations, muscle sensations, joint sensations, etc.

A sensation is commonly treated in psychological literature as a simple element of experience, incapable of analysis. It is universally recognized as having quality and intensity. The quality of a sensation of red is its characteristic redness, as distinguished from the greenness of a second visual sensation, or the pitch of an auditory sensation. The quantity of the sensation, or its intensity, depends upon the strength of the external stimulation and the receptivity of the organ of sense. Thus, a loud sound gives rise to a stronger sensation than a faint sound. A bright light gives rise to a stronger sensation than a dim light. Certain writers have treated other characteristics of sensation as fundamental; so James

SENSATIONALISM

regards duration and extensity as fundamental qualities of sensation. A sound sensation, says James, has three dimensional characteristics. The later development of space perception is merely the outgrowth of this fundamental property of sensations. In the same way the recognition of time is due to the fundamental property of duration which attaches to every sensory quality. Other writers regard extension and duration as derived characteristics which appear only when sensations are united in more complex mental states. (See SPACE and TIME.)

The analysis of consciousness which justifies the scientific student in regarding sensations as simple elements of experience is a theoretical analysis. It is impossible to isolate in consciousness a single sensation. Thus, when one gets the sensation red he always has a background of contrasting color sensations of some type present in consciousness as a background for the sensation of red. Not only so, but all of the other senses are contributing at the same time in some measure to the content of experience. The selection of red or any other single quality as a fundamental element of mental life depends therefore upon a comparison of many experiences in which the given quality recurs. In some of these experiences the color analyzed out is related to black, in others to green, etc. Students of structural psychology lay great stress upon the analysis of consciousness and the complete listing of all sensory qualities. Students of functional psychology, on the other hand, are more interested in the relations which may arise between sensations and the relation of sensory processes to reactions. They therefore give less attention to the enumeration and description of all sensory processes. C. H. J.

SENSATIONALISM — A theory of knowledge in accordance with which knowledge is obtained through sensations, and in ultimate analysis consists simply of the qualities and elements revealed in sense perception. Sensationalism has been a natural offspring of empiricism (*q.v.*) in most of the forms in which empiricism has been held. Many of the most influential of empiricists were not themselves sensationalists, however, witness Francis Bacon and John Locke. Some of their successors have given their theories a sensationalistic turn, however, and their rationalistic opponents have seized upon this interpretation as proof that empiricism finds its *reductio ad absurdum* in sensationalism. The most coherent and complete sensational theories were formul-

SENSE INSTRUCTION

lated in the later part of the eighteenth century and the early nineteenth century, by Condillac and Helvetius in France and James Mill in England.

The strong and the weak points of the educational counterpart of sensationalism are the same as those of the strictly philosophic conception. The insistence upon sense training, and the substitution of perception of objects for memorizing verbal formulae has been of great help in getting instruction away from empty generalities, which, although labeled rational and logical, were either meaningless to the pupil or else were accepted by him on external authority. Sense training for its own sake, however, as an end-all and be-all becomes a formal gymnastic, or else ends in the accumulation of meaningless particulars.

J. D.

SENSE INSTRUCTION. — See OBJECT TEACHING; also ACTIVITY; CONCRETE AND ABSTRACT; SENSE TRAINING

SENSE ORGAN — See NERVOUS SYSTEM

SENSE REALISM. — See REALISM; REALISTIC MOVEMENT IN EDUCATION, OBJECT LESSON; SENSE TRAINING.

SENSE TRAINING — It is a well-known psychological truth that all intellectual development begins with and is based on perception. Each sense brings us a knowledge of the external world which can be obtained in no other way, and all the so-called higher intellectual processes, such as memory, conception, judgment, and reasoning are dependent upon the data given by the senses. Indeed, all our intellectual processes may be said to be engaged in the interpretation and elaboration of the material furnished by the stimulation of the sense organs. Historically, however, this truth has not been always fully recognized. Many thinkers, for example, have held to the theory of innate ideas (*q.v.*), and educational procedure has at times been based upon the view that the educative process is merely the drawing out and development of that which is already in the mind. (See SENSATIONALISM; also EMPIRICISM; IDEALISM; PRAGMATISM, etc.)

Information concerning the external world may be obtained either (1) from direct sensory contact with the object or event, or (2) by means of pictures or other symbolic representations, or (3) through the medium of language. Words are like pictures, in that they represent the objects, but they differ from pictures in that they are not like the objects and can, therefore, be truly representative only in so far as they have been connected with the appropriate object in the past experience of the person using them. Even pictures and other symbolic representations presuppose the proper experiences to interpret them on the part of the pupil. Whenever, therefore, instruction is given by words

SENSE TRAINING

or other means, without an adequate concrete background on the part of the learner it sinks into mere formalism. This is the charge brought against the education of the middle ages by educational reformers like Comenius, Locke, and Rousseau, and the demand for adequate sensory training was the keynote of the work of later great educational workers like Pestalozzi, Herbart, and Froebel. They pointed out that all knowledge is vague, hazy, and indefinite, if not based upon a concrete foundation, and general notions (and with them the higher thought processes in general) are clear and distinct and trustworthy only in so far as the proper sensory foundations have been laid.

In modern times the emphasis upon sense training has taken several different directions. In the first place, it has led to the demand that all the subjects of a course of study should be taught in as concrete a way as possible. Bringing the child, wherever possible, into first-hand contact with the facts, and where this is not possible, using models, pictures, charts, etc., not only are more instructive methods than teaching mere definitions and textbook descriptions, but carry with them an added interest on the part of the pupil. In the second place, the emphasis upon sensory training has taken a more specific direction in the introduction of special courses, like object lessons, nature study, and science, the aims of which have been variously understood. It may not be out of place to point out that sense training cannot properly be said to develop the sense organ, as exercise develops a muscle. Such defects as near- and far-sightedness, color blindness, and defective hearing, for example, cannot be remedied through any system of sensory training. Sense training can mean either (1) enlarging the number of the child's sensory experiences, or (2) increasing the child's capacity for sensory discrimination, that is, his capacity for distinguishing differences of sensation.

In view of the undoubted basal relationship between sensation and all the higher mental processes, it may be taken for granted that it is desirable that the child should have a rich and varied sensory experience from which to draw. All instruction presupposes certain experiences on the part of the child, in the light of which the new knowledge is interpreted. While it is true that the child's mental development before the time of entrance into school has been almost entirely in the direction of acquiring sensory-motor adjustments, careful investigations of the child's knowledge on entering school shows that it is not safe to take for granted that the child has the proper background of experience for thoroughly understanding the instruction of the school, which tends away from the concrete in so far as much emphasis is laid upon language. It cannot be taken for granted, for example,

that the child has had the necessary experiences to understand the reading lessons. This is the largest justification for the introduction of some method of supplementing the child's experience through first-hand contact with concrete objects. Whether this is done in formal object lessons or in some other way, it must be remembered that the sensory impressions are but one part of the process. The form of response is quite as important, not only because in adopting the proper behavior towards an object new groups of sensations (especially touch and movement sensations) become prominent, but also because no object can be properly said to be "known" until it has elicited the proper form of motor response.

Sensory discrimination is also relatively undeveloped in the child, and, indeed, usually remains so even in the adult, except in those cases where the exigencies of life bring about special training in some particular sphere. The child's ability to distinguish spatial and temporal relations is especially weak. It is a well-known fact that all the senses are capable of high degrees of training in these respects. On the other hand, it is a palpable error to suppose that all the senses should be equally highly developed. A highly developed sense of smell, for example, would probably work more disadvantageously than otherwise for most persons. It would be unwise either to attempt to give to children all the possible sensory experiences or to train their sensory discrimination equally in all directions. Mental development proceeds by a process of selection and emphasis of those features of a situation which are important for the purpose at hand, and a high degree of intellectual capacity may be built up on the basis of sensory experiences which are in some respects quite limited as in such cases as those of Helen Keller and Laura Bridgman. SENSIBILITY. — This term is used in several different senses. In its most general sense it is equivalent to affection or primary feeling. It is also used as the abstract term corresponding to sensation. In this sense it is, therefore, the capacity for experiencing sensations. In a more popular sense it is used to denote susceptibility to emotional states.

SENTENCE METHOD. — See READING.

SENTENCES — See SCHOLASTICISM, UNIVERSITIES.

SENTIMENT. — Both popular and psychological usage of the term sentiment is loose, and definitions vary considerably. The most general meaning is that of a class of mental phenomena of the same general nature as emotions, but characterized by a higher degree of ideal consideration and a less intense affective tone. In this sense there are four great classes of sentiments, viz. intellectual or logical, ethical, æsthetic, and religious. It is probable that the organic reaction accompanying the sentiments is of the same nature as in the case of emotions, but of less intensity.

Another use of the term introduced by Shand and extended by McDougall, and in some respects more in accord with popular usage, identifies sentiments with those systems of organized emotional dispositions like love and hate which, while they involve primary emotional attitudes, yet differ from emotion in being as more or less permanent tendencies which are manifest even in the absence of the exciting object.

SERVIA, EDUCATION IN. — Servia, a kingdom of about 2,750,000 inhabitants, with an area of 18,782 square miles, is a surviving portion of the ancient Serbian Empire destroyed by the Ottoman invasion in the fourteenth century. Servian racial elements and institutions, including the system of education, are found in other nations, notably: Montenegro, Austria-Hungary (particularly Bosnia and Herzegovina), and Turkey (Old Servia and Macedonia). All together there are about 7,000,000 Serbs under the authority of the Greek church. Servia became autonomous under Turkey in 1830 and attained independent national existence by the Treaty of Berlin in 1878.

Before and after the Ottoman invasion, Servian education was essentially religious, the only schools being convents. This system still prevailed at the close of the eighteenth century, and has left an undeniable impress

SERVIA

on Servian education even in recent times. During the long period of revolution, started in 1804 to free Servia, various attempts were made to inaugurate a public school system. There was a minister of public instruction in 1811 and again in 1837, and a school fund was established in 1841. In 1863 there were 318 primary schools with 388 teachers and 15,563 pupils; girls' schools existed only in the larger towns, and it was extremely difficult to secure teachers. The commissioner of education in 1870 reported 507 primary schools. In 1882 there were 600 schools, with an average attendance of 10 per cent. There were two normal schools, one at Belgrade, with 143 students, the other at Nish, with 53.

Servia's unfortunate geographical position in the Balkan Peninsula has tended to make progress toward a national educational system slow at best, but distinct improvement has been made. Modern Servia's school system is based mainly on the laws of 1882, 1898, and 1904, the chief provisions of which are given below. It should be observed that this legislation represents rather an educational program than an accomplished fact. According to the 1910 census 17 per cent of the population could read and write. Education is provided for both sexes, but a preponderating proportion of the children attending school are boys.

Law of 1882 — The essential features are as follows. Primary instruction was reorganized. Subjects of study were religion, Servian language (also old Slavonic); geography; history, both Servian and general; drawing and penmanship; singing (church hymns), gymnastics; manual training (for girls' schools only). The primary school has six classes, lower primary, I-IV, upper, V-VI. In communities where there are no upper classes, continuation schools must be provided. Length of school year is from August 6 to end of June. Several communities may unite to form one school district. The school commission of the district is to consist of the head of the political government of the place where the school is located, or of the teacher if there is no local mayor, together with a delegate from each of the communities forming the school district, or two delegates if there is but one community. School commissions are required to draw up a list of children of school age. Education is compulsory for six years. Parents are held responsible for the regular attendance of their children, and in the continuation schools employers are held to the same accountability for their employees, the school commission being empowered to levy fines both on parents and employers for non-attendance of the children. Children who enter secondary schools and certain special schools are exempt from six years' attendance in the primary schools, provided they remain at least two years in the more advanced schools. After ten years of service, and in case of disability from old age

SERVIA

or sickness, the teacher may retire on 40 per cent of his salary. An increase of 2 1/4 per cent will be paid in pension for each additional year of service, up to thirty-five years, when the teacher may retire on full pay.

The law of 1898 provided as follows: (1) Kindergartens to be established, especially in those localities where the spoken dialect differed materially from the written language. (2) Four classes in the elementary school, and instead of the two upper classes, vocational schools of three years' duration to be opened, for both boys and girls. (3) Manual training added to the curriculum of the boys' schools. (4) Special local district committees to be elected to have charge of the school buildings and teachers' salaries. (5) Normal school graduates after two years' experience to take a practice examination before becoming regular teachers eligible for promotion. (6) Teachers' salaries raised at the end of five-year periods. (7) Women teachers to receive less salary than men, and to leave the service if they marry — unless they marry teachers. (8) Teachers' salaries no longer to be paid out of the state treasury, but out of the funds of the cities and school districts themselves. (9) Teachers to hold their positions without change in those schools where they were first appointed. (10) A regular system of school inspection introduced; inspectors to be normal school teachers and teachers in the gymnasiums, or experienced elementary school teachers.

The 1904 law divides elementary instruction into kindergarten, elementary schools, and continuation schools. Elementary instruction is compulsory and free. Special vocational schools may be established — agricultural schools in the rural districts and business and commercial courses in the cities. Ages for school attendance are kindergarten, 4-7; elementary schools, 7-13. Places joining together to establish a common school may borrow funds from the state for that purpose. Pupils taught in private schools or at home must pass a state examination at the close of each school year. If a school district has no special lodgings for the school teacher, it must add 30 to 80 dinars (francs) to his monthly salary for rent. Length of school year is from September 1 to end of June. Requirements for teachers are Servian nationality, diploma of licentiate in letters or of a normal school, and a maturity examination. Special professional courses for the use of the primary teachers are to be provided by the state. The initial salary is 800 dinars, with increase of 250-400 after fourth or fifth year for men, and 250-350 for women, so that the maximum at the end of 27 years is 3000 for men, and 2550 for women. The provision of the 1882 law covering retirement on 40 per cent after ten years is reaffirmed, and the annual increase is raised to 2 7/8 per cent. Married women teachers may remain in the service. Any year in which a teacher

is graded "unsatisfactory" will be left out of account in reckoning years of service. Teachers cannot lose their positions except for proved crime, or for the good of the service, i.e., school closed or classes combined for lack of pupils. Wherever possible, boys are to be taught by men teachers and girls by women.

Statistics.—The budget for education in 1910 was 8,189,950 dinars, as opposed to 6,778,227 dinars for 1909. Of this amount 3,874,000 was for primary instruction. There are now 1305 primary schools, 1151 for boys and 154 for girls. In the boys' schools (primary), there are 1402 men instructors and 672 women. The girls' schools have 342 women teachers. The total number of pupils is 135,674, of which 105,471 are boys. The state supports nineteen schools of gymnasium rank, with 368 teachers and 7159 pupils. The state also maintains one "lycée" for girls, with 25 teachers and 158 pupils, and three other secondary schools for girls with 85 teachers and 1323 pupils. The communities themselves support a number of secondary schools. Of these three are "lycées" for boys, with 42 professors and 405 pupils; 12 for girls, with 136 professors and 659 pupils, and two higher institutions for women with 17 professors and 190 students.

As to special schools, the theological seminary at Belgrade has 27 professors and 343 students, there are two normal schools for teachers of boys, one at Yagodina and the other at Alexinatz, with 25 teachers and 237 students; two girls' normals, one at Belgrade and the other at Kragujevatz, with 31 instructors and 224 students, there is a music school at Belgrade. Other institutions include a school of decorative arts, a military school, and several technical and agricultural institutes.

The University of Servia at Belgrade, founded in 1838 and reorganized in 1905, has faculties of theology, philosophy, law, medicine and engineering. It has 86 professors and 902 students, of whom 46 are women.

SERVICE. — See VALUE.

SERVICE, TRAINING OF TEACHERS IN. — See TEACHERS, TRAINING OF.

SESSIONS, LENGTH OF. — The length of the school day and the distribution of the

school period vary greatly in different countries. In a large part of this country it is customary to have two sessions, one beginning at nine o'clock and continuing perhaps until twelve, the other beginning at one or two o'clock and continuing until four p.m. In many high schools especially in the large cities, a single session is held continuing perhaps from eight-thirty in the morning until one o'clock. The relative advantages of one session as against two have been warmly discussed, and some experimental studies bearing on the problem have been made. The question is relative to many conditions, for example, the distance the children have to travel in coming to school, the customary time of having the midday meal in the community, the opportunities for lunch at the schoolhouse, the conditions in the homes of the children favoring study at home or for play out of doors and other extra-scholastic occupations.

The total length of the school period also should vary according to local conditions, the age of the children, the school occupations, and the like, especially according to the amount of home study needed and required. The total time devoted to school work, both in the home and in the school, should not exceed three hours for children in the elementary grades, and seven or eight hours in the upper grades of the high schools. The tendency is to have most of this work in the schoolroom.

Many students have attempted to adapt the school work to what seems to be the diurnal curve of energy. Many experimental studies of fatigue have thrown light on this problem, but no satisfactory determination of the curve of work or energy has been made. In fact it is impossible to do this except in a general way, since there are such individual differences. There are perhaps several types as regards ability to work. Among mature students Kraepelin found two distinct types: *Morgenmenschen*, morning men, those who do their best work in the morning; and *Abendmenschen*, evening men, those that do their best work at night. Whether or not there are such types among children, we do not know, but the generalizations that some have made to the effect that the best work is always done in the morning, or by others that the best work is done in the afternoon are altogether too sweeping. Until further studies have been made it seems wise, however, to follow the general verdict of observation, also corroborated by the general evidence from experimental investigation, which indicates that the morning hours are the best for intellectual work, and that manual training, physical exercise, and the like may well be placed in the afternoon. Experimental studies have shown clearly that physical exercise, especially gymnastics and such physical exercise as that involved in singing and the like, are by no means to be regarded as recreation, but that they exhaust

SEVEN LIBERAL ARTS

the energy and in case of fatigue are likely to increase rather than diminish it.

The proper length of the school period and the distribution of the work depend also very largely on the hygienic conditions of the school-rooms as regards ventilation, temperature, humidity of the air, and the like, and upon the number and distribution of the recesses, the kind of teacher employed, as well as the character of the tasks.

In the present state of our knowledge, the following points seem to be important —

1. The total length of the period for school work both in the school and at home should not be more than three hours for pupils in the elementary grades and not more than seven or eight hours in the upper grades of the high school.

2. The problem of one session or two and of the amount of time to be spent in the school-room is relative to local conditions in the community on the one hand, and the hygienic condition in the schoolroom on the other.

3. The usual hour for beginning school work in this country, that is, not earlier than eight o'clock in the summer and nine o'clock in the winter, seems to be a good one.

4. It is especially important to provide ample time for recess, not less than that required in Berlin, one hour for a five-hour session, this distributed into one long recess of twenty minutes and several short recesses.

5. There is a general consensus that the more difficult and more intellectual tasks — arithmetic, mathematics, and the like — should come in the morning hours, and the manual training, gymnastics, and the like should be placed in the afternoon.

6. The great individual differences in regard to the curve of work and susceptibility to fatigue make it desirable that the plan for the period of study should be flexible and give as much opportunity as possible for adaptation to individual needs.

SEWARD, THEODORE FRELING-HUYSEN (1835-1902). — American apostle of the tonic-sol-fa method of teaching music; was educated in the public schools of New York and studied music under Lowell Mason (q.v.). He was instructor of public school music in

SEX HYGIENE

Connecticut, New York (Teachers College, 1887-1896), and New Jersey. He became interested in the tonic-sol-fa system of teaching music and devoted his last years to its popularization in the United States. He was the author of many sacred and secular musical works, and joint author with Lowell Mason of *The Pestalozzian Music Teacher*. He was editor of the *New York Musical Pioneer*, the *New York Musical Gazette*, and the *Tonic-sol-fa Advocate*. W. S. M.

See MUSIC.

SEWING — See HOUSEHOLD ARTS

SEX AND EDUCATION — See ADOLESCENCE; COEDUCATION; SEX HYGIENE; TEACHERS, SEX OF.

SEX HYGIENE, INSTRUCTION IN — Necessity of treating the Subject. — The obligation to abandon the policy of silence on the subject of sex has been urged upon the teaching profession chiefly by physicians who are compelled to repair the ravages of venereal diseases. Simultaneously in several nations of Europe and in America medical men have sought the aid of teachers and philanthropists to assist them in the conflict with maladies which afflict the innocent and threaten coming generations. This call of authorized experts it would be base and disloyal to ignore. Even if physicians are inclined to lay too great emphasis on the physical factors of the problem, they are most competent to reveal the significance of the aspect which appeals to them. With the anatomical, physiological, pathological and hygienic problems involved we cannot here adequately deal. To physicians we must leave the task of healing diseases. The educational factors at present concern us. By education is meant much more than instruction. Ignorance is one cause of disease and weakness, but it is not the only cause. Inherited tendencies, vicious examples, crowded habitations, unwholesome habits, alcoholism, and various other elements must be taken into account, and the effects of these factors in morbid appetites and passions are not to be removed simply by giving information. At the same time the members of the teaching profession, both in the school and as leaders of thought, may help to improve the conditions which influence character.

A merely negative attitude on the part of school authorities is impossible, because the charlatans and panders persistently and aggressively invade our schools and circulate printed stuff which is veritable moral poison. The mercenary, organized and avaricious destroyers of our children and youth must be actively fought. While superintendents are passive, the enemy is alert and unscrupulous. It is not a question of leaving the minds of youth "innocent." In modern cities, and often

especially in the country, the information about sex comes from corrupt sources, it rarely fails to reach inquisitive children in some way. We must furnish the truth, or the children will be taught falsehood, while it is vainly imagined that they are secure.

Method — It is, then, a problem of method. Long neglect of the subject has forced sober men to radical and fragmentary efforts and given sentimentalists and mercenary book peddlers a free field. The wisest method would never admit a special pamphlet, book, or lecture on this particular theme. With the best intentions any one who instructs child or adult on sex as a separate subject makes it relatively too prominent and isolates it from its natural connections. The central principle of right procedure may tentatively be formulated thus: *All the normal questions of life should be answered in the interests of the growing person with the simple truth as they arise.* With this we do not discover the most effective agency, but only the essentials of the process. The questions asked by young children, under ordinary wholesome conditions, relate to the origin of babies. The other phenomena of reproduction and the functions of male and female, are usually matters of later inquiry.

The modern curriculum from kindergarten to university and especially in the "continuation schools" offers several natural lines of approach to our theme: biology (nature study), physiology, athletics, and moral instruction. In the studies of plants, animals, and the human body, the facts of reproduction may be presented before any special salacious interest can be aroused. In the physical exercises and the hygienic training connected with them, a wise teacher has an opportunity of giving the desirable directions about diet, dress, bathing, outdoor life, and occupation, without particular reference to sex. In the morality lessons, whether on the basis of the Decalogue or any other summary of human virtues and duties, the teacher cannot pass over the relations of sex.

Agencies — The teacher is inclined to lay all responsibility on parents, and is partly right. Rousseau gave his Emile a tutor only in order that the son of Emile might not need a tutor. So far as the social problem is one of education the teaching profession must take the initiative and at least offer to help the parents with both knowledge and method. At present few parents know how to perform their duty. This policy of beginning with parents is already upon its trial; various school boards and societies of social hygiene have called parents together and given physicians an opportunity of preparing their minds for this serious and delicate duty. This seems to be the best place to begin, because it is so obviously suitable; the schoolhouse is public property, the subject is distinctly educational and the physician is a recognized authority.

Parental Cooperation. — Experience has shown already that a tactful approach to parents will meet with favorable response. In some places a physician has been invited to address mothers and daughters, or the lads, at the time when temptation begins to be acute and when most children of our industrial communities go to work. The objection to this course is that it calls special attention to the topic, gives it overemphasis, and takes it out of its natural relations to other subjects. The main point here is to lay the responsibility on as many parents as possible and offer the help of the school authorities, if desired. In the present situation it is rarely safe to give instruction in matters of sex without first securing parental consent and cooperation; although some teachers, through nature studies, have taught children and youth all that is necessary without raising discussion. When there is laboratory work in biology this is sure to become more general. Meetings of parents with teachers afford excellent opportunities for securing such cooperation.

The Gang and the Camp. — In recent years, and under the guidance of eminent psychologists and educators, the conduct of boys in groups has been studied. It has been found that the worship of force and vitality is an essential part of a boy's religion. In the outdoor sports of lads, and especially in tramps over the country and by camp fires, a wholesome and genial man can utilize the racial reverence for life and force to demonstrate the value of clean thoughts and ways. When the municipal playgrounds are removed from the police and the politicians, and have become an integral part of the educational system, the teachers can vastly extend their influence over boys and young men. What is now done in groping fashion by a few specialists for sons of the rich or as a charity for a few poor lads, will be done for all as a necessary part of preparation for citizenship. Then male teachers will have a full opportunity to become the counsellors of lads and can aid them in a way young women teachers can never do.

The Report of the Vice Commission of Chicago urged the board of education to investigate the advisability and methods of teaching social hygiene to the older pupils in the public schools; to provide vocational training in continuation schools for girls between the ages of fourteen and sixteen; to extend the use of public schools as social centers; to keep school grounds open for children, always under close supervision. This does not go far enough. The attendance agents of schools should be given legal authority, under the board of education, to see that all youth are either in school or at some suitable and useful occupation until they are nineteen years of age. The English "hooligan," the Parisian "apache," and the American ruffian are not the products of the schools but of

SEX HYGIENE

tolerated idleness and of neglect by parents and school authorities during the most dangerous period of life.

Eugenics. — Children learn quite early and naturally that offspring of plants, animals, and men resemble the parents. Likeness is so apparent that it is taken as a matter of course. In simple nature lessons, with the help of a garden, the Mendelian laws can be made familiar to young persons. The inheritance of weakness and some forms of disease can be made clear and its importance explained. When birds, cats, dogs, and other pets are owned the pedigrees can be made the basis of lessons in eugenics. Experience has shown that boys can be made to realize that their own self-control and clean living will affect their children, and examples of failure and misery are only too abundant for the illustration of the sorrows entailed upon posterity by dissolute and feeble fathers and mothers. At the right time in youth these biological truths are very impressive with boys, if properly presented (See **EUGENICS**).

Normal Schools. — It follows from the primary obligation of teachers as professional experts in method that the training schools for teachers should prepare at least selected teachers for this task, both for their own protection and for public utility. In France the supreme educational authorities have adopted a policy of giving instruction in "puericulture" and are providing courses in normal schools to meet the needs of teachers. Here again thorough training of teachers is necessary by the laboratory method in botany, zoology, general biology and hygiene, rather than special lessons in matters of sex. C. R. H.

SEXUAL DIFFERENCES

Wood, T. D., and REESON, M. *A Bibliography on Educational Hygiene and Physical Education*. (New York, 1911.)

SEXAGESIMAL FRACTIONS. — See **FRACTIONS**.

SEXES, SEPARATION IN THE SCHOOL. — See **COEDUCATION**.

SEXUAL DIFFERENCES AND ANOMALIES — The general social consciousness regarding the sexual organs, sexual relations, etc., has developed in such a manner that except in a scientific way the facts are not understood or are misinterpreted or misrepresented, and except in the lower strata of society discussion of these matters is tabooed. In both mental and physical life the sexual element plays a much larger part than most people are willing to admit or even to believe. The investigation of the psychogenic origin of certain mental disorders demonstrates this for the mental side beyond the possibility of question, and statistics of hospitals and of clinics show the importance on the physical side.

The sexual characteristics may be divided into the primary and secondary. The primary are those anatomical and physiological characteristics which deal with the reproduction of the species. The secondary of an anatomical nature are mainly those of size and general contour of the body, the female having a shorter stature, more rounded form, less bodily hair, but more hair on the head than the male; those of a physiological nature are evidenced by the proneness to certain diseases and to resistance against others, and those of mental nature are much more difficult to define. Investigators dispute the alleged facts of each other regarding the mental differences of the sexes, and complications arise from the fact that these differences in mental constitution have been taken as evidence by men of the inferiority of women, though this conclusion is as strongly disputed by women and by some men. To an impartial observer, however, there appears little doubt that there are mental differences, but it does not seem that these can be utilized as evidence of superiority or of inferiority.

The abnormalities, anomalies, and perversions of the sexual character are extremely numerous, and these also are physical and mental.

On the mental side we find all grades of sexual abnormalities, from those in whom the sexual feelings are entirely absent to those in whom these feelings are predominant and constant. Here also belong (a) the extremes of prudery, which would prohibit all nude art, and opposed to this, (b) an absolute disregard of social custom. On the other hand, we also find that instead of the normal liking for the opposite sex, there is sometimes an unnatural

SEXUAL PATHOLOGY

mental gratification from the association with the same sex (inversion)

All these sexual disturbances or anomalies are found commonly among the abnormal classes. It is said that of idiots over one third exhibit differences in the sexual organs and the percentage among criminals is almost as large. The percentage among the insane is smaller, although in past times a sexual etiology was given for many of the mental diseases.

The importance of these matters in school life cannot be exaggerated. Many a boy or girl has been initiated into abnormal sexual practice at an early age because of association with perverts, and practices which have been learned have led to grave mental disorders later in life. This is particularly true in regard to the genesis of certain of the functional psycho-neuroses, e.g. the phobias, states of anxiety, etc. Suspicion or evidence of any of the forms of anomalies mentioned in this article should be communicated by the teacher to the parents (if they be intelligent) or to the school physician, both on account of the welfare of the individual, and also on account of the general class or school morality.

SHAKESPEARE AND EDUCATION. — Although we do not find, as is but natural, any direct and specific handling of education as a subject in the works of Shakespeare, yet there are so many allusions to its advantages and its effects, and, incidentally, to its methods, as to render it not doubtful at all that the sciences must have interested the dramatist greatly. As an example of the effects of education in detail, Hamlet asserts that that

SHAKESPEARE AND EDUCATION

training he had had in fair writing, which he had endeavored to forget, did afford him at a pinch "yeoman's service," and in *Twelfth Night*, Sir Andrew Aguecheek laments that he did not

"Bestow that time in the tongues that I have in fencing, dancing, and bear-baiting. O, had I but followed the arts!"

That, however, this lofty view of the advantages of education was not the view which was held by all at that time, Shakespeare humorously makes us realize in the play of *Henry VI*, where the rabble rebels proceed to hang the clerk of Chatham with his pen and inkhorn about his neck because "He can write and read and cast accounts" and because "We took him setting of boys' copies." And Lord Saye is also doomed to execution because he has "Most traitorously corrupted the youth of the realm in erecting a grammar school. And whereas before, our forefathers had no other books but the score and the tally" (the tally being a little wooden block for keeping accounts), "thou hast caused printing to be used. It will be proved to thy face that thou hast men about thee that usually talk of a 'noun' and a 'verb,' and such abominable words."

It is evident that Shakespeare's conception of a real education was a broad and wise one, and that he realizes the distinction between mere learning and the acquisition of character and power. For in *Love's Labour's Lost* we read —

"Study is like the Heavens' glorious sun,
 That will not be deep-searched with saucy looks;
 Small have continual plodders ever won,
 Save bare authority from others' books."

"So study evermore is overshot,
 While it doth study to have what it would
 It doth forget to do the thing it should"

And in other passages he shows his contempt of pedants and pedantry, as in the case of Sir Hugh Evans, the schoolmaster in the *Merry Wives of Windsor*.

Of the worldly results of thorough education united with talent Shakespeare gives a clear statement in the lines in *Henry VIII*, where Wolsey is referred to as having his "training such that he may furnish and instruct great teachers and never seek for aid out of himself."

It should be noted that this care in the matter of education was not confined to men only, and it is evident from several references in plays that Shakespeare took a liberal view of the education of women; all his heroines are well educated and clever.

Shakespeare further gives us some insight into methods of education at that time. In *The Merry Wives* the boy William is put through his Latin paces, and we find his grammar lesson very much of the same caliber as was common in our schools thirty years ago, and is so still in many of them, with the excep-

tion that the grammatical terms are referred to in Latin and not in English. In the play of *Henry V* we have evidence that some of the methods that are now recognized as good seem at least to have been practiced then. The French Princess Catherine desires to pick up a slight acquaintance of French, and to do so she enumerates various parts of the body in the foreign tongue in a very similar way to that in use now. The importance of interest as a factor in education is mentioned in *The Taming of the Shrew*, in a passage where the poet, after speaking of a number of the usual studies, continues:—

"Fall to them as you find your custom serves you,
No profit grows where is no pleasure ta'en"

Some information can also be obtained here and there of the different types of schools which prevailed in Shakespeare's time. Frequent reference is, of course, made to private schools and tutors, but in the *Two Gentlemen of Verona*, *Henry IV*, and *Henry VIII* mention is made of grammar schools, of Ipswich School, and of Oxford University. Of universities in general, the poet speaks of them as "studious," as places where one becomes a good scholar, or else as in *The Taming of the Shrew* as places where "one may spend all." After the university course came professional education, and in *Henry IV* the good scholar, after studying at Oxford, passes on to complete his law education at the Inns of Court (*q.v.*), while in *All's Well that Ends Well* colleges of medicine are referred to.

On the whole, while no general theory of education can be evolved out of his plays, Shakespeare does recognize both the true ends of education and the difficulties to be surmounted in attaining them. For he makes Portia say:

"If to do were as easy as to know what were good to do, chapels had been churches, and poor men's cottages princes' palaces. It is a good divine that follows his own instructions. I can easier teach twenty what were good to be done, than to be one of the twenty to follow mine own teaching."

Study of Shakespeare — Great though the influence of Shakespeare has been on English language and thought, it was for a long time indirect, owing to the predominance of the classics. English and therefore the study of Shakespeare could find no place in the schools. The first school edition of Shakespeare was not published until 1752. This was the *Beauties of Shakespeare*, in two volumes, selected by Waller. Where this book was not used, special passages were often selected by the teacher and dictated to the pupils to be learned by heart and studied with special reference to linguistic and rhetorical effect.

In a work by Carpenter, Shephard, and Joyce, published in 1817, and obviously intended as a modern handbook, Shakespeare is re-

ferred to especially as affording examples of grammar and devices of rhetoric, and the author is quoted as expressing and giving a model for the finest intensity of dramatic emotion, but there is not the reference to Shakespeare as affording a complete subject for separate study which we now observe in modern education.

During the earlier part of the nineteenth century we find publication of one or two other collections of the beauties of Shakespeare and many editions especially for the stage — proof that his direct influence on education was increasing considerably; and the growth of special Shakespearean societies and circles in different parts of England for the publishing of studies upon his works or for giving readings of his plays is another evidence of the same process. Coming down to later times, in the curricula of the University of London, while a large study of classics is prescribed for every examination for the arts degree (since the foundation in 1845), it is not till 1859 that a work of Shakespeare is given as a special subject to be read, and that only for the first examination for the B.A., the play selected being *King Lear*. Henceforward Shakespeare figures in the London examinations, but it was not for many years that his works appeared in the final examination for the Arts Degree.

Since about the middle of the nineteenth century and the publication of the report of the Royal Commission in 1861, the study of Shakespeare has increased very much throughout the country, as is evidenced by the appearance of separate editions of his plays with notes and introduction. From that time onward the study of Shakespeare in educational institutions has been greatly augmented, together with students' editions of his works, so that now there is scarcely a school in England where one of his complete plays does not form a portion of the curriculum.

For purposes of education his plays present an admirable field. Their diversity of plot, their intense human interest, with variety of scene and situation in almost all, their noble language and witty dialogue, give infinite scope to pedagogic effort. Of the fifteen comedies, *The Merchant of Venice*, *A Midsummer Night's Dream*, and *The Tempest* are those which usually find most favor with the young student; of the seven tragedies, *Hamlet* and *King Lear* are often selected. In addition to these is the wonderful galaxy of historical plays, English and Roman, of these respectively, *Henry VI* (three parts), *Richard III*, *Richard II*, *King John*, *Henry IV* (first and second parts), *Henry V*, *Henry VIII*, *Coriolanus*, *Julius Cæsar*, *Anthony and Cleopatra*. Their study is found to be a powerful adjunct toward vividness of impression in the teaching of history. It is hard to say which has been found most useful in the direct field

SHALER

of education; *Henry V* and *Julius Caesar* are perhaps the most often read. H. O.
See LITERATURE, ENGLISH

SHALER, NATHANIEL SOUTHGATE (1841-1900). — Dean of the Lawrence Scientific School of Harvard University; graduated from the Lawrence Scientific School in 1862 and served two years as an officer in the Union army during the Civil War. He was instructor in the Lawrence Scientific School from 1868 to 1872, and professor in Harvard University and dean of the Lawrence Scientific School from that date until his death. His publications include *First Book of Geology, Story of Our Continent, Interpretation of Nature, The United States of America*, and many scientific works. W. S. M.

SHAME. — A painful emotion of self-abasement in view of the real or supposed ill opinion of others. This emotion, together with shyness, bashfulness, coyness, and modesty, to all of which it is closely allied, seems to have its root in a primitive instinct of self-abasement, which expresses itself in a general diminution of muscular energy, hanging down of the head, the blush (in man), and so forth. Shame proper implies self-consciousness on the part of the person experiencing it, though the instinctive tendency in its primitive form is present in the lower animals and young children.

SHAW, EDWARD RICHARD (1850-1903). — Dean of the School of Pedagogy of New York University; graduated at Lafayette College in 1881. He was instructor at Greenport, N.Y., 1881-1883; principal of the Yonkers High School, 1883-1892; professor in New York University, 1892-1895, and dean of the School of Pedagogy of New York University, 1895-1903. His publications include *School Devices* (1891), *Studies in Education* (1899), *School Hygiene* (1901), and various papers on educational subjects.

W. S. M.

SHAW UNIVERSITY, RALEIGH, N.C. — An institution for the education of young men and women of the colored race. There are eight departments: industrial, teaching, scientific, liberal arts, theological, law, pharmacy, and medical. The requirements for admission to the classical, scientific, or pedagogical courses are the corresponding preparatory courses or their equivalent. The degrees of A.B., B.S., B.Th., Ph.S., and M.D. are conferred. Of 540 students enrolled in 1910-

SHELDON, EDWARD AUSTIN

1911, sixty-seven were in the collegiate department. The college faculty consisted of eighteen members.

SHEFFIELD, UNIVERSITY OF, SHEFFIELD, ENGLAND — One of the recently founded English universities, receiving the royal charter in 1905. The university was organized out of the existing University College which had been founded in 1897 by the union of Firth College (f. 1879), the Sheffield School of Medicine (f. 1828), and the Sheffield Technical School (f. 1884). Like other municipal universities of England, the University of Sheffield stands in intimate relation to the life and needs of the town and neighborhood. The supreme governing body is the court of governors, on which there are representatives of a number of local authorities; the council is the chief executive body, and the senate has charge of the academic matters of the university. The following faculties are maintained: arts, pure science, medicine, law, and applied science. In the last named faculty, the department of metallurgy with its laboratories for iron and steel, the industries of the town, and the degrees in metallurgy, need special mention. Besides the faculties there is a department of education for training elementary and secondary teachers, for which a grant is received from the board of education. Students working for the degrees of B.A. and B.Med. may take their work partly in day and partly in evening courses, but under this arrangement cannot graduate in less than five years. The university as a member of the joint matriculation board has power to examine and inspect schools. It is also represented on the education committees of several local authorities. Through a committee of council the university also conducts a number of extension courses. The university draws its income from endowments, fees, and grants from a number of local authorities, from the treasury and from the board of education. In 1910 there was an enrollment of 885 day and 1225 evening students, with a faculty of 161 members.

SHELDON, EDWARD AUSTIN (1832-1897). — First principal of the Oswego Normal School and originator of the Oswego movement (q.v.); was born at Perry Centre, N.Y., Oct. 4, 1823. He entered Hamilton College intending to prepare for the profession of law, but poor health compelled him to give up his collegiate studies at the end of the third year. In 1848 he took charge of a Ragged School (q.v.) at Oswego, N.Y. It was composed of "one hundred and twenty rude and untrained Irish boys and girls between the ages of five and twenty-one years."

SHELDON, WILLIAM EVERETS

Mr. Sheldon was superintendent of the schools of Syracuse from 1851 to 1853, after which he returned to Oswego to organize a free public school system for the town. Twelve years of effort to train the teachers under his supervision and give them some vision of Pestalozzian methods led in 1861 to the organization of the Oswego Normal School. But the schools of the city under Mr. Sheldon's superintendency had really been training schools, for he had in a large measure eliminated books from the primary schools and "substituted teachers for books."

The institution was at first a city training school, but in 1863, largely through the efforts of Victor M. Rice (*q.v.*), then State Superintendent of Public Instruction of New York, the legislature granted \$3000 a year toward its support, and in 1866 Oswego became one of the regular state normal schools of New York. As the aim of the school was to introduce the Pestalozzian methods, Mr. Sheldon secured the services of Miss Margaret E. M. Jones, who had been connected with the Pestalozzian training schools in England, and Herman Krüsi, Jr. (*q.v.*), the son of one of Pestalozzi's colleagues, and an experienced normal school instructor.

Mr. Sheldon gathered striking personalities from Europe and America and held them together for years, and, as an American student of education well says, "he shaped a coherent course of study and turned out a large group of teachers who thought teaching, on Oswego lines, the greatest thing in the world." The emphasis which Mr. Sheldon placed upon object teaching made possible the subsequent introduction of nature study in the schools of the United States. He continued at the head of the school until the time of his death, Aug. 26, 1897.

He was the author of several manuals on object teaching, a series of school readers and spellers, and numerous papers on educational subjects. His *Autobiography* has been edited by his daughter, Mary Sheldon Barnes (*q.v.*) (New York, 1911). W. S. M.

SHIRREFF, E. — See WOMEN, EDUCATION OF.

SHOOTERS, ABC-SHOOTERS. — A term applied to the young boys who were placed under the care of the baccants (*q.v.*), or wandering students, to be taken to good schools or to be instructed by them. In practice the shooters were compelled to beg or to steal food, including frequently the throwing of domestic fowl. The term "shooters" (Germ. *Schützen*) may have arisen from this practice of throwing fowl, or from the slang "*Schiessen*," to steal. As applied to the letters of the alphabet, the meaning is obvious enough.

SHREWSBURY SCHOOL, SHREWSBURY, ENGLAND. — One of the nine great public schools (*q.v.*) of England, founded as a free school at the request of the bailiffs, burgesses, inhabitants, etc., by Edward VI, as the *Libera Schola Grammaticalis Regis Edwardi Sexti*. Thomas Ashton was the first

headmaster, but little is known of the work of the school in the first ten years. From 1561, however, the school met with remarkable success through the energy of its headmaster, and within about a year numbered about 266 pupils (sons of burgesses, or *oppidani*, and altons, or *alieni*). Among the distinguished pupils were Sir Philip Sidney and Fulke Greville. One of the early features of the school was the encouragement of dramatic performances by Ashton, who himself wrote several plays. Under Elizabeth the funds of the school were augmented, and statutes (1571) and ordinances (1577-1578), mainly the work of Ashton, were issued. The appointment of the headmaster was given to the bailiffs, but the right of selection was left to St. John's College, Cambridge, where a number of exhibitions were also founded for the school. The headmaster had by preference to be an old pupil of the school and a burgess of Shrewsbury, a condition unbroken until 1798. The entrance requirements to the school were writing, English, and Latin accidence. A scale of fees was drawn up varying with the rank and domicile of the pupils' parents. "Shooting in the longo bowe, chesse plaine, running, wrestling, leaping" were the forms of recreation which were allowed. The following schoolbooks were in use: Tully, the *Commentaries* of Cæsar, Sallust, Livy, and two little books of Dialogues drawn out of Tully's *Offices* and *Lodovicus Vives* by Mr. Thomas Ashton for Latin prose, and Vergil, Ovid, Horace, and Terence for Latin verse; while for Greek the books were Clenard's *Greek Grammar*, Greek Testament, Isocrates, and Xenophon's *Cyropaedia*. Ashton was succeeded in 1571 by Thomas Lawrence, who, like his predecessor, was not in orders. The school continued its successful career and at one time numbered 400 pupils, while Lawrence sent 100 boys up to Oxford and Cambridge. Under John Meighen (1583-1635), also a layman, a library, houses for the masters, a new schoolhouse, and a chapel were added. Twice the career of the school was checked by an outbreak of sweating sickness, while further trouble was caused by a dispute between the bailiffs and St. John's College on the question of the appointment of the headmaster. The promise at the beginning of the century was unfortunately not fulfilled. Meighen's success was continued by Thomas Chaloner, but the outbreak of the Civil War and the later Puritan domination were not conducive to stability, and the school gradually underwent an eclipse until in 1798 the old ordinances were repealed by act of Parliament, a new governing body was appointed, and the restrictions on the appointment of headmaster were removed. In the succeeding century the school had but three headmasters, Samuel Butler (1798-1836), Benjamin Hall Kennedy (*q.v.*) (1836-1866), and Henry Whitehead Moss (1866-1908). A new spirit of

scholarship was introduced into the school by Dr. Butler, a friend of Dr. James of Rugby and editor of *Æschylus*. The numbers in the school began to increase, mathematics was taught privately, and studies and method were reorganized. A system of periodical examinations and promotions by merit was introduced, and its effect was marked by the notable series of successes at Oxford and Cambridge. Many of the ideas of Dr. Butler were borrowed and adopted at Harrow and Eton. Dr. Butler was a strong advocate of the monitorial system of government of the boys by prefects or senior pupils. Life was hard at the school, bullying was rife, and at least two instances of general insubordination are reported. But Dr. Butler's influence was wholesome, none the less. He was succeeded in 1836 by Benjamin Hall Kennedy, the famous classical scholar, who, although he trained many fine scholars, was unable to keep up the numbers in the school, which was condemned by the public school commissioners in 1862 for lack of suitable accommodation. Dr. Kennedy further became entangled in a dispute on the interpretation of the term "free school" (*q.v.*), the inhabitants of Shrewsbury interpreting it in its literal sense. During his headmastership the modern studies, including French and mathematics, were added to the curriculum; games and athletics were encouraged; and an interest in music was stimulated by the establishment of a school choir. Under Rev. H. W. Moss the school was removed to new buildings at Kingsland, on the Hereford side of the Severn, and continued to carry on the high traditions established by the two preceding heads. In 1908 Rev. C. A. Allington was appointed headmaster. The school is divided into classical, modern, and science sides, and special work is given to boys preparing for the army. There were 340 pupils in the school in 1912, of whom 315 were boarders distributed in eight houses. The staff included thirty-three masters.

SHURTLEFF COLLEGE, ALTON, ILL. — A coeducational institution founded in 1827 at Rock Spring and moved to Alton in 1832. A charter was obtained in 1833, and the present name in honor of a benefactor was adopted in 1836. It is under the auspices of the Baptist denomination. Academic, music, and college departments are maintained. The admission requirements are equivalent to the work of a high school. The A.B., B.S., and B.L. degrees are given by the college. The enrollment of collegiate students in 1910-1911 was sixty-three students in the college and forty in the academy. The faculty consists of fifteen members.

SHYNESS — See MODESTY, also ADOLESCENCE; EMOTIONS.

SIAM, EDUCATION IN.—Siam is an independent kingdom, bordered on the north by Burma and by French Indo-China which extends, also, along its eastern border, meeting Cambodia, which forms the southeastern boundary. The Gulf of Siam, an arm of the South China Sea, completes the southern boundary and washes the eastern shore of the Malay peninsula which continues the kingdom as a narrow neck of land between the Gulf and the Indian Ocean. The British have encroached upon the west and southwest of the kingdom, and the French upon the east, while the whole area is marked by spheres of influence belonging to one or the other of these two European powers. Add to these influences that of the Chinese who send into the kingdom an ever increasing stream of immigration, and it is easy to realize the nature of the transforming forces and the spiritual collisions to which the kingdom of Siam is subject.

The educational influences of the past have been the ceremonial forms of the autocratic government, the division into social orders, each with its defined sphere of duties and privileges, and the prevailing religions. The great body of the people are Buddhists, and the ethical code of the founder of this faith is everywhere venerated. The Siamese government, however, has always been tolerant of other religions. Moslemism was introduced by Arab merchants, and in the latter part of the seventeenth century a serious attempt was made to convert the entire kingdom to that faith. The Chinese colonists maintain the study of Confucius, but make few proselytes, and Christian missionaries, Catholic and Protestant alike, establish their schools and churches without interference. The first Roman Catholic priests entered Siam in the early part of the seventeenth century in the train of Portuguese settlers, but it was the founding of the French Catholic Mission in the far East and the selection of Bangkok as the site of its headquarters which gave that faith a permanent footing in the country. This religious teaching has not, however, made much progress among the Siamese, and although there are two bishoprics, many churches, and a multitude of priests in Siam, the congregations are composed chiefly of Chinese.

The American Presbyterian Mission has been maintained in Siam since the early part of the nineteenth century, and its members, who are dispersed over the country, gain much influence by their knowledge of medicine which they freely use for the benefit of the people.

Ever since the establishment of Buddhism in the country, a certain amount of instruction

has been within the reach of the people. In the monasteries the monks interrupted their studies to impart the elements of reading, writing, and ciphering to boys and young men. Modern education was introduced by Christian missionaries, and after the accession of King Maha Mongkut, who had acquired a taste for knowledge from the American Presbyterian missionaries, the establishment of modern schools was encouraged. This monarch also began the practice of sending boys to foreign countries to be educated. In this way an interest in technical pursuits was excited. In 1891 Prince Damrong was dispatched on a special mission to Europe to study the principles of western administration, and upon his return a department of education was established which later was developed into the ministry of public instruction. From this action dates the school system which the government is now developing. Efforts were first directed to the establishment of elementary schools which were divided into two classes, one very elementary, the other comprising two divisions, one of two years for instruction in Siamese, the other covering a five-years' course in English as preparatory to higher scientific instruction.

After the initial steps had been taken, progress was interrupted by other pressing matters, but lately the system of public instruction has been vigorously promoted. In Bangkok many schools were established, and from this city the work was carried to the interior of the kingdom. The old temples, of which there are about 13,000, have been made the seats of the new schools, which gains them the confidence of the people. A government boarding school for the sons of nobles was established in Bangkok, and under the charge of a staff of English teachers has proved eminently successful. A similar school was opened for young women, and two training colleges for teachers. These were followed by special schools of law, medicine, military training, civil service schools, etc. From statements for the current year it appears that there are 150,000 pupils in the lower primary schools, 8000 in the higher primary, and 1000 pursuing secondary studies, or a total of 159,000 pupils in modern schools under government direction, this number is about 2 per cent of the estimated population, six and three fourths millions. The king has granted two scholarships, each yielding \$1500 a year for four years, to be awarded upon the results of competitive examination to students who will pursue some technical branch in European schools. The law school under the Department of Justice has been in operation ten years, graduating about twelve students a year. Meanwhile the mission schools have been greatly extended. The Roman Catholic College of Assumption for boys at Bangkok has over 400 students; the American Mission

SICARD

School for girls at Wanz Lang, Bangkok, is the largest in the kingdom.

The most important recent addition to the government provision is the technical school established in 1909 under the department of lands and agriculture. It comprises sections of surveying, irrigation, engineering, and scientific agriculture. From the fact that Siam is essentially an agricultural country, great expectations center in this institution.

The provision of a medical institute for researches in bacteriology and serotherapy, and comprising a Pasteur institute, has been recently assured through the combined action of the government and private endowment.

The following government schools are at the capital: 138 lower and middle primary schools with 10,000 pupils; 4 upper primary schools with 420 pupils; 2 lower secondary schools, 184 pupils, and 6 English schools with 549 pupils. The special schools under the minister of public instruction and worship registered in 1911 a total of 278 students distributed as follows: medical college, 108, training college for teachers, 68; civil service college, 70; school of midwifery, 32.

The present king, like his father, Chulalong Korn, son of Maha Mongkut, employs a permanent staff of European and American advisers and is gradually introducing western ideas into the administrative system. The penal code was definitely formulated and carried into force Sept. 21, 1908. The metropolitan force is well organized, and internal improvements are pushed in every direction.

SIGNATURE.—See MUSICAL NOTATION.

SIGNIFICANT FIGURES.—As soon as the Hindu-Arabic numerals (see NOTATION) were introduced into Europe the difference between the nature of zero and the other figures was the subject of comment by several writers. In order to explain clearly the fact that the zero has no value by itself, while the other nine *notæ* or *characteres* signify definite values, the latter were called significant figures. Stifel (1544) says of them: *Et novem quidem priores, significativas vocantur*, and other Latin writers used similar expressions. The word was soon adopted in French, as in the work of Peletier (1519): *Chacune des neuf premières (qui sont appelées significatives)*. The Germans had a similar term, *bedeutlich*. Thus Grammatous (1518) speaks of *neun bedeutlich figuren*, and Adam Rieser (1522) says *Die ersten neun sind bedeutlich*. In English, "signifying figures" was a common expression with such early writers as Recorde (1540) and Baker (1568).

At present the explanation of the numerals is not found so difficult as to make it seem worth the while to perpetuate the expression "significant figures," and it is accordingly being discarded by writers on elementary arithmetic. D. E. S.

SIGNS.—See DEAF, EDUCATION OF THE.

SIGOURNEY, LYDIA HUNTLEY (1791-1866).—Writer and advocate of the higher education of women (*q.v.*); was educated in the district schools of Connecticut and by private tutors. She taught in the district schools and was principal of a private secondary school for girls at Hartford. She was active in the movement that resulted in the organization of secondary schools for girls in New England.
W. S. M.

SILENT READING—Reading in silence is an exercise specially devised (1) to focus attention upon the thought rather than the mechanics of reading, and (2) to foster a more rapid rate of reading than children ordinarily develop by the oral method. Silent reading is a supplement to oral reading throughout the grades,—(a) quite secondary in the primary classroom, where the formal work of translating visual symbols into sounds is difficult, (b) most important in the intermediate grades, where quick and accurate thought getting is the chief aim (c) once more subordinate in the class work of the grammar grades, where the expression or communication of literary feeling and form is stressed.
H. S.

See READING, TEACHING BEGINNERS.

SILJESTRÖM, PER ADAM (1815-1892).—Swedish educator, born at Calmar, Sweden, and educated in the elementary and secondary schools of Sweden. He engaged in elementary school work and was active in the reorganization of elementary education along modern lines. He visited England and the United States and made a careful study of the elementary school problems in these two countries. He was especially impressed with the public school revivals in Massachusetts under Horace Mann (*q.v.*) and in Connecticut under Henry Barnard (*q.v.*). His impressions of American education were embodied in a comprehensive work entitled *Educational Institutions of the United States*, which was translated from the Swedish into English by Frederica Rowan (London, 1853). Siljeström founded at Stockholm the New Elementary School, which was patterned after the newer conceptions of education, with considerable emphasis on nature study and the nascent interests of children. He was for many years director of this school and afterwards emeritus director. He died at Stockholm, Feb. 19, 1892. He was the author of a number of important books on education.
W. S. M.

SILL, EDWARD ROWLAND (1841-1887).—Poet and teacher, graduated at Yale College in 1861. He taught for several years in Ohio; was principal of the Oakland (Cal.) High School from 1871 to 1874, and professor of English literature in the University of

SIMON

California from 1874 to 1882. The excellent courses in English in California secondary schools are largely due to his efforts.
W. S. M.

SILLIMAN, BENJAMIN (1779-1864).—Scientist and author of scientific textbooks, graduated from Yale College in 1796. He was tutor and professor at Yale from 1799 to 1853. He was active in the American lyceum movement (*q.v.*) and gave many public courses of lectures on scientific subjects. He founded the *American Journal of Science* (1818) and was president of the American Association of Geologists in 1840. He traveled widely in Europe, and his *Journals of Travels* (1810) gives accounts of the scientific institutions in the Old World. He was the author of textbooks on chemistry and geology, and many scientific works.
W. S. M.

SIMMONS COLLEGE, BOSTON, MASS.—Was founded in accordance with the provisions of the will of John Simmons, a Boston merchant, who died in 1870. The charter was granted in 1899 and students were received in 1902. Simmons College is a technical college for women and was the first collegiate institution of this character established in the United States. The requirements for admission are essentially the same as those of the usual academic colleges, except that no ancient language is required. The regular programs of study occupy four years and lead to the degree of B.S. These programs include not only the necessary technical or professional studies, but also the most closely related academic subjects, and furnish therefore not only the preparation for a vocation, but also the essentials of a liberal education. Briefer programs, including only technical studies, are also offered for graduates of other colleges and for especially mature students. The technical departments of the college are the following: (1) household economics, (2) secretarial studies, (3) library science, (4) general science, (5) social work, (6) industrial teaching. The college possesses several dormitories in addition to its instruction buildings. Its endowment is about two million dollars. In 1912 there were 97 instructors and 944 students in the regular classes, and about 200 students in the extension and summer classes. Of the regular students 99 were graduates of other colleges.
H. L.

SIMON, JULES FRANÇOIS (1814-1890).—French statesman, philosopher, historian, teacher, and journalist. He entered the École Normale in 1833, and left there three years later with the title *Agrégé* (*q.v.*). During that time he met Victor Cousin (*q.v.*) and began a long friendship. He taught philosophy in the lycées at Rennes, Caen, and Versailles,

SIMPLIFIED SPELLING BOARD

and received an appointment at the Sorbonne in 1839. He also taught at the Ecole Normale, his work both here and at the university meeting with notable approbation. Elected to the National Assembly (1818) he was appointed to the Conseil d'Etat, whence he was retired and likewise removed from his professorship by his refusal to submit to Louis Napoleon after the coup d'etat of 1851. He was returned to the Assembly in 1863, and subsequently played an important rôle in the troublous activities of the war and the post-war period. He was Minister of Public Instruction (1870-1873), and Prime Minister (1876-1877). In 1875 he was elected to the French Academy. A stout champion of educational privileges for all, he strove to dot the country with schools which should be not only free but compulsory. He was unable to carry through these fundamental changes in educational policy on account of the precarious state of the national finances after the war. It was about ten years later before they became a reality, but in the meantime he had struggled for the reorganization of the whole educational system in response to the oft-quoted assertion that it was the Prussian school teacher who was responsible for France's downfall. He was the author of more than thirty books and of enough scattered articles to make one hundred more. Among his more important writings may be mentioned the following: *L'Ecole* (Paris, 1804); *Histoire de l'Ecole d'Alexandrie* (2 vols., 1844-1848); *Instruction gratuite? laïque? obligatoire?* (Paris, 1872); *La Liberté de l'conscience* (1857); *La Réforme de l'Enseignement secondaire* (1874).

SIMPLIFIED SPELLING BOARD — See SPELLING and SPELLING REFORM.

SIMULATION. — Abnormalities are simulated for various purposes (to arouse pity, to make money, or to escape the consequences of certain acts). The simulation of insanity is common among criminals, but it is now recognized that many of the individuals who simulate insanity are cases of hysteria or of real insanity, and that the simulation is secondary to the true mental disorder.

Among children simulation of injuries to escape the performance of unpleasant tasks is common. Care must be exercised in the differentiation of the real from the imaginary, and the possibility of the condition being due to vivid imagination must be kept in mind. S. I. F.

SINTHEIM

SIMULTANEOUS METHOD. — See CHRISTIAN BROTHERS' SCHOOL, LA SALLE.

SIMULTANEOUS SCHOOL (SIMULTANSCHULE). — The term used most generally in Germany to refer to the type of elementary schools attended by children of different religious denominations, each of which gives its own religious instruction through either teachers, where the numbers justify the engagement of teachers of other than the official church, or visiting clergy of the respective denominations. Frequently this type of school is also called *paritätisch*. In these cases, religious instruction does not form the core of the curriculum as it does in the denominational schools (*Konfessionsschulen*), but has its place alongside of the other subjects of instruction. The term simultaneous schools is also employed to include other types of schools which are not denominational, e.g. (1) schools in which no religious instruction is given or where moral instruction takes its place. This form is not found in Germany. (2) Interdenominational schools, in which children of all denominations are given instruction in the common fundamentals of all religions. Such schools have been established in Nassau. In the German secondary schools the principle of simultaneity of the type above mentioned, by which ministers of the different denominations have the right of entry, seems to have been generally accepted.

SINTHEIM, SINTHEN, or ZINTHIUS, JOHN (fl. 1476). — A teacher at the St. Lebuin School at Deventer of which Alexander Hegius (q.v.) was the headmaster. Sintheim belonged to the Brethren of the Common Life (q.v.). He appears to have had a reputation throughout Northern Europe as a humanist scholar, and Erasmus (q.v.) after decrying the school generally says, "From Hegius and Sintheim the school drew some savour of true letters." Sintheim, on his side, showed much admiration for Erasmus' ability. He edited the *Doctrinale* of Alexander de Villa Dei (q.v.), and published grammatical commentaries.

SLATE — **Early History** — The ancient precursors of the slate were the wax tablets, used by Greeks and Romans, and a black tablet used by the Hindus. The ordinary method was to write upon the wax with a stylus, although Herodotus speaks of a letter being written on wood, which was then covered with wax before being sent. The common form was a pair of tablets inclosed in wooden frames and hinged together by wires. The resemblance of these ancient wax tablets to the slates so recently used in our schools is

SLATER FUND

too striking to be wholly accidental. Albitūni (1000 A. D.) in his work describing the customs of the people of India, states that the Hindus at that time used black tablets for the children in the schools, writing upon them from left to right with a white material. Prosdocimo de Beldamandi, in a work on arithmetic of 1410 (printed in 1483), gives one of the earliest references to the modern slate, stating that the calculator has always a stone tablet upon which he is able to write and erase the figures used in his calculation. Chaucer makes probably the first mention of the slate in English literature in his *Astrolabe* II, § 44. "enter hit in-to thy slate."

In American Schools. — Slates were rather slowly introduced into our schools and were rarely found before the close of the Revolutionary War. But there is in the possession of the American Antiquarian Society at Worcester, Mass., an inland slate, set in the top of a desk, which was a gift from Rev. Nehemiah Walter, a Harvard graduate of 1684, to his daughter. A letter from a New England schoolboy to his father in 1752, in which he requests his mother to send him among sundry other things his "slate and som pensals," is extant. In Mr. Win. D. Fowle's report to the trustees of the Boston Monitorial School in 1825, he says, "Every child in school is furnished with a slate and pencil, which are considered a part of the furniture of the school." (See *Journal of Education*, Vol. I, p. 33)

School slates have disappeared from nearly all the schools in this country except remote rural regions. While they served a good purpose in their day, they were dirty, noisy, and hard on the eyes of the children as well as foreign to the procedure of ordinary business. Paper and pencils have taken their place, to the advantage of the pupil, the teacher, and public health generally. L. C. K.

SLATER, J. F., FUND. — One of the great educational foundations of the United States established for the education of freedmen. In 1882 John F. Slater, a cotton and woolen goods manufacturer of Connecticut and Rhode Island, granted \$1,000,000 in trust "for the uplifting of the lately emancipated population of the Southern States and their posterity by conferring on them the blessings of Christian education." Through good management the fund has not been reduced. There are nine trustees in charge of the fund with W. A. Slater as president, and James H. Dillard as general agent. As with the Peabody Fund (*q.v.*) the founder allowed considerable latitude in the disposal of the money. The Fund has, however, been up to the present mainly devoted to the support of normal and industrial education. Aid was given in the early days to such institutions as give "instruction in trades and other manual occupations" for the purchase of machinery and apparatus

SLAVONIA

At present, grants varying from \$100 to \$10,000 are made to institutions for the payment of salaries to teachers of industrial subjects, principals and directors, and for supplies and running expenses of institutions for the education of the colored race. From 1908 an annual grant of \$1000 for three years was made to Charleston, S.C., to maintain an industrial school for the negroes as part of the public school system. In this way a precedent was established for assisting public authorities in extending their system in a way which might otherwise have been impossible.

SLEEP. — The state of sleep is of importance to the psychologist because there appears in this state so radical a modification of the nervous and mental condition that the explanation of normal waking life is largely influenced by a consideration of the suspension of normal activity in sleep. Studies of the nervous system indicate that the internal resistance of the nervous tissues is increased during certain portions of the day. During these periods the nervous system is undoubtedly engaged in more energetic building up of its tissues. The suspension of activity seems to come in rhythmical waves, and is not necessarily connected either with fatigue or exhaustion. Thus, an individual who has been in the habit of closing his day's work at a given period will always feel drowsy and sleepy at that time, whether he has worked energetically during the day or not. In young children the rhythm seems to be somewhat shorter in its periods than with mature individuals. A close relation between this fact and the shorter period of the child's attention undoubtedly exists. The nervous conditions which arise during sleep do not appear in all parts of the nervous system in the same degree. Thus, in ordinary sleep the higher centers of the cerebrum are more completely suspended in their activities than the lower centers of the spinal cord. Indeed, the lower centers may be said to continue their activity without serious interruption. The reflex processes of the abdomen, and the reflex control of the limbs go on during sleep without interruption. In some cases excitation takes place in the higher centers, and there results a more or less complete establishment of ideational processes. (See DREAMS)

Various abnormalities of sleep arise, such as somnambulism (*q.v.*) and trance (*q.v.*) Artificial sleep may be produced by the use of various drugs and in hypnosis (*q.v.*). C. II. J.

SMART, JAMES HENRY (1841-1900). — University president; was educated in the public schools of New Hampshire. He was principal of rural and graded schools in New Hampshire (1869-1893); principal of schools at Toledo (1863-1895), superintendent of schools at Fort Wayne, Ind. (1865-1874), state superintendent of public instruction of Indiana (1874-1878), and president of Purdue University (1883-1900). He was one of the educational commissioners to the Paris Exposition of 1878. His publications include *Institute System of the United States*, *Ideal School System for a State*, and various papers on educational subjects. W. S. M.

SMELL — See SENSES

SMITH, ADAM (1723-1790). — The economist and philosopher, born at Kirkcaldy and educated at home, at Glasgow University and at Balliol College, Oxford. After giving free public lectures at Edinburgh, he was appointed professor of logic at Glasgow in 1751 and professor of moral philosophy in 1762. From 1760 he traveled in Europe for a few years and came into intimate contact with the encyclopedists and physiocrats of France, who exercised a strong influence over him. In 1778 he received an appointment as Commissioner of Customs and spent the rest of his days in Edinburgh. In 1787 he was elected Lord Rector of Glasgow University. He was the author of a number of philosophical works; but he is best known by his *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776). In Bk. I, Ch. I, Articles 2 and 3 of this work, Smith deals briefly with education under the titles "Of the Expense of the Institutions for the Education of Youth," and "Of the Expense of the Institutions for the Instruction of People of all Ages." Except for an interesting application of the rule of *laissez-faire* to education and an attack on endowments (*q.v.*), there is nothing of permanent value in this chapter. Competition, emulation, and rivalry not as stimuli for the teacher, endowments cripple his application. Smith attacks the universities and schools not only for neglecting their work in the financial security enjoyed by them, but for the narrow scope of such work as they offer. "The greater part of what is taught in schools and universities, however, does not seem to be the most proper preparation for that business" (of the world). In the case of women, for whose education public insti-

SMITH, ANSON

tutions did not generally exist, there was no waste, for their parents gave them just that instruction which was of use to them. Dividing the population into the common people and the middle and upper classes, Smith holds that the latter by force of circumstances will educate themselves, it is the common people, engaged in occupations which have a deadening effect on their intelligence, who require attention. Reading, writing, and accounts, with geometry and mechanics are the minimum instruction to be required of all. "For a very small expense the public can facilitate, can encourage, and can even impose upon almost the whole body of the people, the necessity of acquiring these most essential parts of education. . . ." Smith advocates the establishment of parish or district schools, maintained partly at public expense, partly by fees. But attendance is only indirectly to be made compulsory — by instituting an examination for entrance to a trade or profession or to obtain the freedom of a corporation. Finally, Smith emphasizes the value of education to man as a human being as well as its social value to a nation. "A man without the proper use of the intellectual faculties of a man is, if possible, more contemptible than even a coward, and seems to be mutilated and deformed in a still more essential part of the character of human nature. Though the state was to derive no advantage from the instruction of the inferior ranks of people, it would still deserve its attention that they should not be altogether uninstructed. The state, however, derives no inconsiderable advantage from their instruction. The more they are instructed, the less liable they are to the delusions of enthusiasm and superstition, which, among ignorant nations, frequently occasion the most dreadful disorders."

In the second article Smith deals mainly with institutions for religious instruction and strongly advocates the study of science and philosophy (encouraged by compulsory entrance examinations to the professions) as a means by which "the state might, without violence, correct whatever was unsocial or disagreeably rigorous in the morals of all the little sects into which the country was divided."

 RAE, J. *Life of Adam Smith* (London, 1895)

SMITH, ANSON (1811-1887). — Superintendent of schools, educated at Williams College. He was superintendent of the schools of Toledo (1850-1856); state superintendent of the schools of Ohio (1857-1863); and superintendent of the schools of Cleveland (1863-1867). W. S. M.

SMITH COLLEGE

SMITH, ASA DODGE (1804-1877) — Graduated from Dartmouth College in 1830 and studied at the Andover Theological Seminary. He was principal of an academy at Limerick, Me., and was president of Dartmouth College from 1863 to 1877. He was the author of *Moral Element in Education*. W. S. M.

SMITH, CHARLES SPRAGUE (1853-1910). — College professor and social worker, born at Andover, Mass., and educated at Amherst College where he graduated in 1874. From 1875 to 1880 he traveled in Europe; on his return he became professor of German at Columbia University and in 1892 professor of modern languages and foreign literature. Owing to failing health, he resigned his professorship in 1891 and was for a time a public lecturer. In 1895 he organized and became President of the Comparative Literature Society. His best known work, however, was the establishment of the People's Institute (*q. v.*) in 1897, with which he was connected until his death. In 1907 he founded the Ethical Society League to promote the co-operation of the church and civil bodies in public matters. Professor Smith was the author of *Barbizon Days* (1902); *Working with the People* (1904); and a volume of *Poems*, published in 1908.

SMITH COLLEGE, NORTHAMPTON, MASS. — Founded by Miss Sophia Smith, who bequeathed about \$350,000 for that purpose, named a board of trustees, and stated as the object of the college "The establishment and maintenance of an institution for the higher education of young women, with the design to furnish them means and facilities for education equal to those which are afforded in our colleges for young men." The college was incorporated and chartered in March, 1871, and in that same month the citizens of Northampton voted the small sum of \$25,000 which decided its location in that town. In June, 1873, Rev. L. Clark Seelye, professor of English literature at Amherst College, was chosen president, but the opening of the college was postponed until 1875. At the beginning of the fourth year, 1878, when for the first time four regular classes were in attendance, there were 133 students, 72 of whom were in the entering class, and the resident faculty had increased to fourteen. In September, 1911, the number of students was 1509, and that of the faculty 120. At the first commencement in 1879 degrees were conferred on eleven graduates; in 1911 the graduating class numbered 357, and the alumnae 4900.

The endowment, which at the start was so small that the trustees allowed it to accumulate for four years before opening the college, has always remained inadequate for its growth.

ing needs. Gifts have added to it, but the total of these is not large as compared with the amounts received by many colleges with fewer students. That, in spite of this fact, the college has been able to provide the necessary equipment and excellent instruction for so many students is a tribute to the administrative ability of its first president. The academic buildings now (1912) number thirteen, and there are fifteen large houses for student residence.

At the time that Smith College was opened, the higher education of women was still in the experimental stage. Among the institutions which provided for their instruction, Vassar College was the only one which could be properly called a college, and it had a large preparatory department. Hence the general principles which the trustees of Smith College adopted are worthy of note. There was to be no preparatory department, the courses of study and the grades of scholarship were to be those required for the degree of bachelor of arts in the best colleges for men; at the same time, the college was to be distinctively a college for women, with every possible opportunity for developing and perfecting womanly characteristics.

The curriculum from the first corresponded with the prevailing usage in New England colleges, but offered a wider range of electives than most of these, and among them music and art were included as academic subjects. In accordance with a provision of Miss Smith's will, the Bible found a place in the curriculum, but as a literary rather than as a theological study. Emphasis has always been placed on physical culture, — systematic exercise being required of all students throughout their course, — in the first two years by class work in the gymnasium. Sports, especially out-of-door sports, are encouraged, but no inter-collegiate contests have ever been permitted.

Another departure from precedent was the plan of housing the students in comparatively small groups in separate houses, each of which is presided over by a woman who has charge of the social and domestic life, and each house is conducted so far as possible as an independent and well-ordered private home.

The first president of Smith College, Rev. L. Seeley, D.D., LL.D., to whose wisdom and tireless effort is chiefly due the great success of the adventure which thirty-seven years ago seemed so uncertain, resigned his office in 1910, and was succeeded by Marion Le Roy Burton, Ph.D., LL.D. J. T. S.

Celebration of the Quarter Century of Smith College. (Cambridge, Mass., 1900.)

SMITH, GOLDWIN (1823-1910). — An educator, writer, and critic born at Reading, England, the son of a practicing physician.

Educated at Eton and Oxford, he was graduated from the latter in 1845 with first-class honors in classics, having also taken the Hertford and Ireland prizes and scholarships for English prose and for Latin prose and verse. He was called to the English bar in 1847, but finding the life of a barrister too narrow he soon turned to literary and educational work. He was one of the early contributors to the *Saturday Review*. His first conspicuous work, however, was as assistant secretary to the Royal Commission investigating Oxford University and as secretary to the second Commission (1852). His *Report* was an influential instrument in freeing Oxford from many abuses, and to Smith was given the credit and the criticism as well. In the same year appeared his *Lectures on the Study of History*. In 1858 he became Regius Professor of Modern History at Oxford, which position he held until 1860. During this period he took an active part in the reform movements in England and in the antislavery discussion in America. In 1868, partly because of dissatisfaction with tendencies in English life, partly because of interest in American political affairs, he became professor of English and Constitutional History in Cornell University, just then opening its doors. He remained in active service only three years, but continued to hold an honorary professorship. In 1873 he moved to Toronto, Canada, where he continued to reside until his death.

This long period was devoted to active intellectual pursuits not only as a writer, but as a journalist and lecturer. One great ideal which he advocated was the political union of Canada and the United States. Through his independence of thought and action he exerted a most stimulating influence on opinion in the United States as well as in Canada. An outspoken critic, he risked much of his popularity in later life by criticizing the Boer War and the American expansion following the Spanish War.

Beginning active life as an educational reformer, he left his mark on education as well as on politics in the countries with which he was connected. His writings were most numerous. Perhaps the most notable are those on *The Political Destiny of Canada and Canada and the Canadian Question*. Others are, *Political History of the United Kingdom*, *Political History of the United States*, and *Essays on Questions of the Day*, *Irish History and Irish Character*, *Three English Statesmen*, *The Empire*, *Does the Bible Sanction American Slavery?* *The Civil War in America*, *Letter on Southern Independence*, *Rational Religion and Rationalistic Objection*, *The Political Destiny of Canada*, *Loyalty*, *Aristocracy and Jingoism*, *False Hopes*, *Lectures and Essays*, *Comper*, *Jane Austen*, *The United States*, *Essays on Questions of the Day*, *A Trip to England*, *Oxford and her Colleges*, *William*

SMITH, GOLDWIN *Reminiscences*, edited by Arnold Haultain. (New York, 1910)

SMITH, JOHN BLAIR (1756-1799) — First president of Union College; graduated from Princeton in 1773. He was instructor at Hampden-Sidney College from 1777 to 1779 and president of the college from 1779 to 1780. He was president of Union College from 1795 to his death. W. S. M.

SMITH, SAMUEL STANHOPE (1750-1819) — First president of Hampden-Sidney College, graduated at Princeton in 1769. He was tutor at Princeton and later taught in a school conducted by his father. He was president of Hampden-Sidney College (1775-1779), professor at Princeton (1779-1795), and president of Princeton (1795-1812). Author of *Lectures on Moral and Political Philosophy*, and several works on religion. W. S. M.

SMITH, SIR THOMAS (1513-1577). — English scholar and statesman, born at Saffron Walden, Essex. After preparation, probably at the grammar school of his native town, he entered Queens' College, Cambridge, in 1526, and was made King's scholar in 1527. On graduating B.A. he was appointed fellow in 1529-1530 and proceeded to his M.A. in 1533. In the latter year he became public reader and lectured on natural philosophy in the schools and Greek in his own rooms. Four years later he was appointed Public Orator. From 1540 to 1542 he visited the universities of France and Italy, and graduated in law at Padua. On his return to Cambridge he became prominent in the proposals for the reform of the pronunciation of Greek and with Cheke (*q.v.*) strongly advocated a restoration in pronunciation of the proper values of the vowels and diphthongs, as had been proposed earlier by Erasmus, in opposition to the prevailing practice of giving them all the same value as *vota*. The reformers were known as "etists", their opponents as "itists." Some progress was made by the reformers, when in 1542 Gardiner issued a decree ordering a return to the old practice. This called forth a pamphlet from Smith in defense of the reform *De recta et emendata linguæ Græcæ pronuntiatio* to which was added another on a reform of the English alphabet by the addition of five vowels (*De*

SMITHSONIAN INSTITUTION

recta et emendata linguæ Anglicanæ Scriptiōe). In 1543-1544 Smith was appointed Regius Professor of Civil Law and by the methods which he had studied abroad contributed to a revival of interest in the subject. In the same year he served also as vice-chancellor of the university and introduced formal matriculation and registration of all students. From 1547 to 1554 he was provost of Eton. The last thirty years of his life, with the exception of his retirement during Mary's reign, he spent in active public life as a diplomatist and member of Parliament, but continued to maintain his interest in his *Alma Mater*. Smith had the reputation of being one of the most versatile scholars of his age and as a classicist was a strong rival of Cheke.

SMITH, WILLIAM (1727-1803). — First president of the University of Pennsylvania; graduated from the University of Aberdeen in 1747. He was Commissioner of Schoolmasters in Scotland, and later came to America as a private tutor. He was the first provost of the College and Academy of Philadelphia (1754-1779). When the charter of the institution was revoked, he became chief director of the German schools of the Province of Pennsylvania. He was president of Washington College from 1782 to 1789, and with the restoration of the charter of the University of Pennsylvania (1780) he again became president of that institution. He was the author of a number of historical and religious works. W. S. M.

SMITHSONIAN INSTITUTION, WASHINGTON, D.C. — An institution established in 1846 by Act of Congress in accordance with a bequest of James Smithson (1765-1829), who left \$515,169 to the United States "for the increase and diffusion of knowledge among men." Smithson, Lewis, or Macie, as he was variously known, was the illegitimate son of the Duke of Northumberland. He was interested in scientific study, especially chemistry and mineralogy, and was elected a member of the Royal Society. The Smithsonian Institution was placed under a board of regents consisting of the Vice President, and Chief Justice of the United States, three regents appointed by the president of the Senate, three by the speaker of the House of Representatives, and six selected by Congress, of whom two were

to be from the District of Columbia and the rest from four different states. Joseph Henry was appointed secretary. The chief purpose of the Institution is to encourage research and publish reports and treatises. A library and various collections were formed. The earliest investigation conducted was a study of the phenomena of storms, and this work led later to the establishment of the Weather Bureau. The various exploring expeditions added considerably to the collections of the Institution. Among the publications of the Smithsonian are *Contributions to Knowledge*, begun in 1848; *Annual Report of the Board of Regents*, since 1847; *Smithsonian Miscellaneous Collections*, since 1860. Connected with the Institution are the following departments for the study of special branches: Bureau of Ethnology, organized in 1879; the National Zoological Park, 1890; Astrophysical Observatory, 1891. In 1891 a bequest was left by Thomas G. Hodgkins and part of this was used to encourage studies in the nature and properties of atmospheric phenomena. Since 1900 the Institution contributes scientific literature in America to the International Catalogue. The American Historical Association and the National Society of the Daughters of the American Revolution submit reports to Congress through the Institution.

SMYTH, WILLIAM (1797-1868) — Author of mathematical textbooks; graduated from Bowdoin College in 1822. He was professor at Bowdoin from that date to his death. He wrote *Elements of Algebra* (1833), *Algebra for Schools* (1852), *Trigonometry* (1855), and *Analytical Geometry* (1855). W. S. M.

SNELL, GEORGE — Friend of Samuel Hartlib and John Dury (*qq.v.*). In 1649 Snell wrote under the diagram of "In Grege Solus," a treatise on *The Right Teaching of Useful Knowledge*. Snell had been asked by Hartlib and Dury to write out a scheme of study whereby youths "may henceforth be realists and materialists; to know the very things and matters themselves," Snell insists on the "vocal and manual institution of children." By "vocal" teaching he means clear pronunciation; by "manual" instruction he would have children, "as it were hand-led to do and act every duty." Snell appeals for a comprehensive dictionary for the English language, and at the same time he proposes an "edict" to settle what the words are of the English language. He advocates the school teaching of shorthand for the speedy

taking down of lectures and sermons. Every one above an artificer should learn arithmetic. His lectures on the teaching of good manners and civility have much good sense. One of his suggestions—common to him and Milton—is the teaching of the laws of England. Before leaving school, the pupil is to be instructed as to the best books to acquire to help him to perform fully the duties of his future life. Young children should be taught not to be terrified by tales of witchcraft, devils, etc., and elder ones should be put on guard against cheaters and deceivers. Snell gives excellent reasons for the study of Latin. He thinks by good methods of teaching Latin, time may be saved for mathematics, cosmography, drawing. Snell is encyclopedic almost as far as Milton, and his proposals in 1649 suggest the organization of secondary education. F. W.

SOCCER FOOTBALL. — This game, like Rugby football, had its origin in the ancient game of football which has been traced back to the Greeks and Romans. When the students in the English public schools began to plan organized football in the early part of the nineteenth century, two sets of rules were adopted with the result that after a few years two distinct games of football had been developed. One was Rugby (see FOOTBALL) and the other Soccer, also known as Association football. Soccer grew rapidly in favor all over Great Britain and the British colonies. To-day it occupies in Great Britain a position similar to that of baseball in the United States. There are professional teams organized into leagues; and the popular interest in the big matches is such that more than one hundred thousand people attend a single match. There are thousands of organized teams in the schools, universities, towns, and cities of Great Britain and the British colonies. Soccer has been introduced in continental Europe, China, Japan, and other countries, and bids fair to become the most popular and widespread athletic game in the world.

In the United States, soccer was introduced by Englishmen about 1880. The first teams were organized among workers in the mill towns of New England. About 1903 the game was introduced in a few schools and colleges. Since that time the interest in soccer has increased by leaps and bounds. There are now thousands of organized teams in the colleges, secondary and elementary schools. It is estimated that during the present school year, 1912-1913, soccer is played by more students than American football.

Some prominent educators advocate the substitution of soccer for American football in elementary and secondary schools. Many schools have already made the change with

SOCIAL ACTIVITIES

entirely satisfactory results. Soccer has been introduced in several girls' schools. Under proper supervision, there is no reason why healthy girls should not play this game and derive much wholesome recreation and physical benefit. The remarkable growth of interest in soccer is due to the inherent qualities of the game. It may be played by students of all sizes and ages, from the elementary school to the university. The game is simple enough for novices to enjoy it from the beginning, and yet it affords opportunities for increasing skill. The equipment required for the players is simple and inexpensive. The regulation costume consists of a flannel shirt, flannel flannels, stockings, and stout shoes, but boys usually play the game in ordinary street clothing.

As an exercise for growing boys and young men, soccer is very beneficial. The object is to advance a round football by kicking and dribbling until near enough to the opponent's goal to kick the ball between the goal posts. The players are constantly running and dodging, thus getting a large amount of wholesome natural exercise.

Soccer affords all the educational values of the best team games. It is played by teams of eleven players, and team play or cooperative effort is essential to success. The players (except the goal keeper) are not permitted to touch the ball with the hands; and personal contact between players, such as tackling and holding, is prohibited. This is the chief difference between soccer and American football, and because of this characteristic soccer players rarely suffer serious injuries.

SOCIAL PSYCHOLOGY.—That division of the science of psychology dealing with the mental processes which grow out of the social relations of conscious individuals. Many of

SOCIAL PSYCHOLOGY

the characteristics of the individual are dependent upon his social environment. There is therefore no sharp line of distinction between the subject matter of general psychology and the subject matter of social psychology. On the other hand, it is convenient for purposes of discussion to distinguish between the mental processes of the individual and those phases of life which are dependent upon social intercourse. Thus language is primarily a product of the community as a whole. Individuals use language and are very largely determined in their modes of thought by the language which they employ. On the other hand, no individual is able to produce a language without the cooperation of others. Indeed, as was pointed out in the study of language (*q.v.*) one of the most important conditions for the selection of verbal reactions is the presence of an answering social companion. Language, therefore, may be regarded as a special topic under social psychology.

The term social psychology as thus employed is broader than any of the special terms which deal with social activities. Thus, race psychology (*q.v.*) deals with the peculiar characteristics of different races. Mob psychology (*q.v.*) deals with the characteristics of a peculiar social group. Folk psychology has been suggested as the more general term, but in ordinary usage the term "folk psychology" is virtually a synonym of the term "race psychology."

The general term social psychology is here used as the translation of the German word *Volkpsychologie* or *Völkerpsychologie*. The most elaborate work on this subject is from the pen of Wilhelm Wundt. He divides the field into three main divisions: (1) Language, (2) Myths and Religion, (3) Customs and Laws. He calls attention in the introduction to this work to the justification for the use of the term "social consciousness." There are certain conscious processes, which, as indicated above, would never be possible outside of the social group. Thus a custom could not develop except as there were various persons who imitated each other, and thus perpetuated the custom. (See **IMITATION.**)

In recent psychological discussions, increasing emphasis is laid upon the social environment and the mental characteristics which are induced through contact with this social environment. Thus the presence of a word in the common language of the social group is enough to direct the attention of the individual to facts which would otherwise escape his notice. The mere naming of an object is therefore a means of controlling the individual through his social environment. The exercise of all forms of authority over the individual represents another type of social control. The child grows up in the presence of his elders, and is from the outset dominated

by their interests and their habits. He readily takes on those modes of action which are congenial to the group as a whole.

The individual may sooner or later break away from those modes of behavior that belong to the group. He then manifests individualistic traits as distinguished from the social traits which he takes on as a member of the community. Individualistic traits of an important order appear in such personalities as those described by the term *genius* (*q.v.*). In such cases, because of unusual personal endowments, the individual is able to direct his own conduct in novel ways. Very frequently the advantage of the social group is served by the later imitation of the activities of the genius. In some cases, however, the eccentricities of the genius have no social importance and are never imitated by others.

For the purpose of education, it is important to distinguish between certain individual characteristics and characteristics of the social type. Thus, manual dexterity is in a very large measure an individual possession. It may indeed grow out of imitation of others, and may thus be the product of social relations, but in so far as manual dexterity depends upon individual practice rather than upon imitation, it is an individual possession, and it is not easily communicated to another. Reading, writing, and the system of number ideas taught in the schools are, on the other hand, primarily social activities undertaken not on individual initiative or for the purpose of increasing the skill of the individual, but for the purpose of putting him in contact with his fellows. Language has, therefore, a peculiarly social significance in the education of the individual. This is still more obvious when we consider the importance of the number system as it is taught to children. The number system is an elaborate method of thought which has been worked out by the race, and is given to the individual, very frequently without any elaborate explanation of the use to which the individual is to put the system. Society as a whole recognizes the importance of the number system, and requires that every individual shall become acquainted with it to a greater or less extent. The extent to which the individual is required to cultivate this system of experience is often wholly unrelated to his individual needs. The system is primarily a social system.

A large part of social consciousness is dependent upon imitation (*q.v.*), often imitation of the involuntary type, rather than elicit knowledge. For this reason, recent writers (see Ross's *Social Psychology*) have emphasized the importance of suggestion in all social relations. The individual takes on the habits and customs of his environment gradually and without explicit recognition of the fact that he is adopting the modes of behavior which are about him.

Another type of contrast between social consciousness and clear intellectual recognition of social relations is pointed out by McDougall in his *Social Psychology*. McDougall contends that the psychological treatises have never been available for the science of sociology because the psychologists have dwelt at great length upon the clear cognitive processes, but have given relatively little attention to the emotional processes. The emotional processes are those which lead most directly to activity, and consequently are of greatest importance in determining the relation of one individual to another. McDougall has accordingly prepared a psychology which he regards as available as the basis of sociology, and in this psychology he describes the emotional processes to the exclusion of the intellectual processes.

Both of the writers referred to in the last two paragraphs neglect, in their effort to emphasize the nonintellectual phase of mental life as the basis of social consciousness, the importance of the social arts, especially language, and they certainly underrate the conscious effort of the race to educate the younger generation in the ideas and practices of the older generation. Thus the school itself is an institution which definitely aims to carry over all of the experiences of earlier generations to the younger generations. It is not primarily an institution that does its work through suggestion, or through mere imitation. The effort of the school is to cultivate certain systems of ideas and to give these ideas definite content.

Social psychology, as a separate branch of science, is in its infancy. It is closely related to the science of sociology, which is also a relatively new science. The methods of research which are offered to social psychology are descriptive and statistical. There is a natural tendency to turn to primitive peoples for a large body of the material that is to be used in social psychology. Primitive peoples are so sharply contrasted with civilized peoples that a study of their simpler life suggests many important lessons for the student of modern life. One very suggestive contribution to this discussion has been made by Dewey. He calls attention to the fact that there is a temptation in the study of primitive peoples to describe their characteristics in negative terms. They do not have as fully developed a language as civilized peoples have; they do not have science; and they do not have many of the highly developed arts. This negative description is, however, misleading if it is assumed that the primitive race does not have many compensating positive characteristics. The hunting consciousness, for example, is full of characteristic elements and modes of operation. The hunter has his attention drawn to animal life in all of its different forms, and his social and religious ceremonial will be

colored by his interest in animals. Our treatment therefore of primitive people should be not merely for the purpose of contrasting them negatively with later civilized peoples, but also for the purpose of discovering those characteristics which enter positively into their primitive consciousness. (See PRIMITIVE PEOPLES, EDUCATION AMONG.)

In the same general way it should be pointed out that children are not merely negative in their social characteristics. The child has a relatively meager vocabulary and little mastery of any of the social arts, and yet he lives in a social environment which has many positive characteristics; his social recognitions may be limited, but they are very intense. The child is more a member of the family than is the adult who comes in contact with others outside of the family group. The child is more dominated by the customs of his elders than his elders are dominated by each other. There comes a period in every child's training when there is a strong tendency to break away from the narrow restrictions of the earlier social group in which he grows up. The period of adolescence (*q.v.*), which has often been recognized as a period of great importance in education, undoubtedly gets some of its importance from the readjustment of social relations and the consequent radical readjustment of the children's attitude towards society and its controls.

The individual teacher is very frequently disposed to regard the problem of the classroom as a problem of individual psychology. The fact is that many of the problems of instruction are distinctly problems of social psychology. The class group exhibits certain characteristics that never would be exhibited by its individual members isolated from the group. There are advantages to be derived from class grouping. Thus children imitate each other more easily than they imitate adults. A group made up of children of a given age differs from a group made up of children of miscellaneous ages. Problems of class instruction as distinguished from individual instruction are, therefore, problems in social psychology as well as in educational psychology. Attention is already drawn under the term "mob psychology" (*q.v.*) to certain of the associational characteristics of the group of people who come together accidentally under high emotional tension. This type of emotional consciousness should be contrasted with the type of deliberate social consciousness which grows up in the classroom when a teacher sets a goal clearly defined to be attained through social cooperation or competition. Thus the students are called upon to be regular in attendance in order that the record of a given class may be superior to that of other classes in the school. This is not primarily an emotional situation. It is adherence under social pressure to a clearly defined ideal. C. H. J.

SOCIAL PURITY MOVEMENT. — See SEX HYGIENE, INSTRUCTION IN.

SOCIAL REALISM. — A term recently coined to indicate a phase of educational realism (*q.v.*) of the early modern period to be distinguished from the realism of the school, which was interested either in the content of literature (Verbal Realism), or the phenomena of nature (Sense Realism). Social realism represented the combination of the literary elements of education, confined in the Middle Ages to the clergy and in the early Renaissance period to a class of scholars, with the remnants of the old chivalric education (*q.v.*), for all of the members of the upper social class. The content and literature of Social Realism are discussed under the caption GENTRY AND NOBLES, EDUCATION OF.

SOCIAL SCIENCES. — The sciences which have for their subject matter social phenomena, that is, the phenomena occasioned by the existence of social groups, such as families, tribes, states, and nations. They are special and general. Among the special social sciences are history, political economy, politics, ethics, jurisprudence, archaeology, ethnology, ethnography, demography, and technology. The general social science is sociology. It inquires into the nature of the fundamental laws and general principles underlying social phenomena, and, accepting as data the principles induced by the other social sciences, it attempts to synthesize them into a consistent whole. It bears about the same relation to the

SOCIAL SCIENCES

special social sciences as biology bears to the special sciences of organic nature.

With the exception of history and politics the social sciences are of comparatively recent origin. Political economy (see ECONOMICS), for instance, one of the oldest of them, although its beginning appears in scattered documents and treatises produced in many lands and at different times, was not organized into a systematized body of knowledge suitable for school instruction until the publication of Adam Smith's *Wealth of Nations* in 1776. The very name of sociology was unknown until the appearance of the fourth volume of Comte's *Philosophie Positive* in 1839.

The introduction of the social sciences in the organized curricula of the schools of Europe and America has been very slow until within the last few years. For a long time history and political economy stood almost alone in representing the group of social sciences in the higher education of the world. During the last twenty-five years, however, several others have been added. The rapidity with which they have come into scholastic favor may be inferred from the fact that courses in the most complex and difficult of them all, namely sociology, are now provided, in fact if not in name, in universities of almost all the leading countries. About four hundred of the higher educational institutions of the United States are now teaching sociology, almost all of them having introduced the subject within the last twenty-five years.

As to instruction in the social sciences in secondary and primary education, the tendency is toward its general introduction. France enacted a law in 1882 providing that primary instruction should embrace moral and civic instruction, and some common notions of law and political economy. In the secondary schools of other European countries they are gradually being introduced in a less formal way. In few of them, however, do any of the more recent social sciences form a separate and important part of the organized curriculum. In the United States they are rapidly making their way, a considerable percentage of the secondary schools having formally introduced them. In perhaps a still larger percentage they are taught informally. There is strong reason to believe that as the collective consciousness develops the subject matter of the social sciences will gradually be pushed downward through the entire educational system.

SOCIAL SETTLEMENTS, EDUCATIONAL WORK OF — The beginnings of educational effort on the part of settlement houses go back for their historical source to Frederick Denison Maurice and his associates who established the Workingmen's College in 1854. Later this group of men became powerful at Oxford and Cambridge, and their teachings found expression among their followers, first in university extension and later in the university settlements, particularly under the leadership of the Rev Samuel A. Barnett, the founder of Toynbee Hall. An integral part of the settlement tradition from the first has been that which involves bringing to working people what is best in art and music as well as in literature and science. While the pressure of working-class conditions and needs has inevitably restricted this motive, it has continued to give distinction to the work of the English settlements. This tradition was passed on in full vitality to the first settlement houses in the United States. Stanton Coit, who founded the original American settlement, the Neighborhood Guild in New York, and the men who followed him, were loyally attached to different colleges and universities. The young women who established the first women's settlements were profoundly influenced by the then recent "gift" of the higher education for women, and were moved to repay some part of their obligation in terms of community service. In a unique way the early settlement residents pledged their belief in the higher education as a means of social reform. Working-class neighborhoods everywhere were to be made better, richer, and more joyous by bringing to their service the best that had been thought and done in every department of life. Culture, however, according to these early residents, could be communicated only through vital contact of life with life. Therefore the main reliance is not to be placed in a teaching staff, but in bringing those who lack culture into close-range, all-around contact with such as possess it.

Settlement residents recognize that their club and class work can be little more than experimental and suggestive. The recognition is also cordial and clear that it is the public school alone which brings our great double experiment of democracy and cosmopolitanism within the range of possibility. Because the common school represents the high-water mark of public interest in forming a better average type of individual, and because it is the most concerned of all public institutions in opening the gates of culture and knowledge to

SOCIAL SETTLEMENTS

all the people, they give themselves wholeheartedly to fostering its work and widening its influence in every possible way.

The application of aggressive good-will to the human issues of public education at once led residents to act as educational advocates and advisers in the neighborhood. Every settlement group is morally bound to be energetic and constant in its watchfulness against any failure of public school equipment and service in its own neighborhood to measure up to the standard for the city as a whole. In many cities, settlement residents have seconded the efforts of citizens to keep school management out of politics, and in their own localities have canvassed the community, explained the issues to the people, and aroused them to the seriousness of the stake. A number of residents have served on local school boards, or as local truant officers, or in a few instances as public school teachers.

The settlement endeavors to make sure that every child of school age is attending school. A number of houses have made school canvasses from street to street in order to secure the proper enforcement of the compulsory education law. Every effort is made to induce parents to keep their children in school until they finish the grammar grades, to awaken the interest of working boys and girls in the evening schools, to send them to those classes which best meet their needs, and to find ways and means whereby children of exceptional talent may go on to high school and college. All settlements continuously bring to the attention of the people the larger educational purposes and values of the public school. In a number of instances, settlement women's clubs have been roused to a vital interest in the work of the neighborhood schools, and have contributed time and money to enhancing its resources. Public school alumni associations have been organized.

Many settlements have found it necessary, at some time, to supplement the formal public educational machinery of their neighborhoods at its upper and lower reaches. Most of the settlements of the country have maintained one or more kindergartens, in advance of their adoption by the public schools; and a number of houses are still maintaining them because the number supplied by the public authorities is not yet sufficient to meet the need. In many cities settlements have established the first evening schools, or have carried on evening elementary classes during the spring and summer in cases where there were immigrant groups who desired instruction.

In a number of cities, classes in sloyd, handicraft, and domestic science were first held in settlements, and afterwards gradually taken up by the public educational authorities. In a very unique way settlement workers have discovered and brought out the civic and moral values in club work, with its important train-

SOCIAL SETTLEMENTS

ing in association and organization. A suggestive instance of the way in which public school methods are at present being enriched is found in the teaching of domestic science. Settlements early discovered that the establishment of cooking classes in a simply and tastefully furnished apartment similar to that in which the majority of the pupils live, was the means of placing the whole subject in a much more effective light. Public schools in several cities are now securing such apartments, organized in some cases directly from settlements, and this plan of instruction is likely to be widely adopted.

Some very important educational experiments have taken the form of making the connection between the school and the home. Our system of education presupposes a well-arranged and resourceful family group capable of enforcing and supplementing the school and the teacher. Where the home is hampered in its functions, or fails altogether in some of its duties, the settlement has endeavored to organize work that would be practically effective in meeting the immediate need, and educationally valuable in assisting the members of the family to understand the cause of the difficulty and to meet it in the future out of their own acknowledged resources.

A very far-reaching contribution in this direction came with the introduction of the school nurse. In 1902 Lillian D. Wald, of the Henry Street Settlement in New York, presented to the school board a body of facts gathered by a resident, who was both a teacher and a nurse, showing the loss of time suffered by children who were excluded by the medical inspector and not properly cared for by the home. The services of a member of the nursing staff were detailed without charge to the school system for a formal experiment, and at the end of a month twelve nurses were appointed by the Board of Health. From New York the plan rapidly spread to other cities, in some of which the settlements again made the initial experiment.

One of the most highly significant methods of strengthening the relation between the home and the school has come about through the recent appointment of "home and school visitors," which is the formal name for a kind of work carried on informally ever since the settlement originated. The visiting teacher is, as it were, a trained nurse in the field of practical morals, and her duty consists in studying truant, backward, or unruly children in their homes and their neighborhood affiliations, for the purpose of discovering the causes of their delinquency and eliciting every sort of remedial resource.

The problem of the hungry and the underfed school child is, also, one that has faced the settlement from the very start. In most large cities there is an appreciable proportion of children who go to school without adequate

breakfast or luncheon. Settlements have been among the leaders in carrying on experiments in providing lunches in neighboring schools. The majority of settlement residents, however, believe that money and energy would be much more fruitfully expended by bringing specifically invigorating influences to bear on the entire number of families throughout the city from which come the undernourished children.

One of the most powerful motives of settlement residents has been that of organizing and surrounding the leisure of children and young people with the restraints and incentives of education. From the very beginning the settlements have endeavored, in scattered ways, to secure a broader and freer use of public school property for the benefit of all the people. One of the first forms which this work took was the establishment of vacation schools, and in a number of cities settlements carried on the first summer classes and later induced the educational authorities to assume the expense. In several cities also settlements have brought about the use of public school playgrounds for children after school hours and during the summer.

The influence of settlement residents in promoting the afternoon and evening use of the school plant for social and recreative purposes has been powerful and far-reaching. Settlement club and class work has been a constant stimulus and challenge, and in addition settlement residents in the large cities have been persistent in their endeavor to secure school halls for public lectures, entertainments, meetings of school alumni associations, and parents' meetings. Thus entering wedges have been used to secure other privileges, such as the use of the school gymnasium, the opening of rooms for musical clubs, cooking classes, and other purposes.

Ultimately those who are advocating the larger use of public school buildings hope that the school may be made the educational and recreation center for each local community. (See *SCHOOL AS A SOCIAL CENTER*.) Within late years this motive has grown with great rapidity and is finding widespread expression with little direct contact from settlements. The same may be said, with much greater emphasis, of the playground as one of the earliest extensions of educational service which the settlement undertook. It must be said, however, that the settlement holds strongly to the necessity of adequate trained leadership for all such effort, and for its systematic integration with neighborhood life.

The need of training for the earning of livelihood very early led settlement residents to establish classes in the handicrafts, and such instruction, together with the settlement initiative in the campaign of vocational education which followed, was largely instrumental in precipitating the present public

interest in industrial training, vocational placing, and various other tendencies toward making the necessary articulation between the home, the school, and the workshop. Residents of settlements have served on public commissions, prepared exhibits, and given much time to organizing campaigns in this interest. An important outgrowth of settlement experience in promoting industrial education was the discovery that the two years between fourteen and sixteen are practically wasted in the case of the child who goes to work at fourteen. The labor of children of this age is of value only in the parasitic industries, such as that of cash girl and messenger boy; and the occupations leave their victims less equipped for life than when they left school. These two years are recognized by psychological experts as having very high value for purposes of education and perhaps particularly for training for industry. The majority of settlement workers now hold that in the near future, as public facilities for trade education develop, the compulsory period of school attendance will be raised to sixteen years of age, — the "two wasted years," in all cases where they end the child's education, being reserved for industrial training.

The important influence which the settlements have exerted, by reaction upon the educated classes and upon higher educational institutions, academical and professional, toward the fuller social application of every sort of special capacity and training, is generally recognized. It will doubtless stand as one of the important educational services of the settlement that it directly and indirectly objectifies to the men and women who are assuming leadership in the various fields of human endeavor the place of the expert under the more and more dominant conditions of democracy. R. A. W. and A. J. K.

SOCIAL STUDY. — See **SOCIAL SCIENCES; Sociology.**

SOCIALISM AND EDUCATION.—Socialism is primarily a theory of possible social organization, and in its strictly scientific aspect a proposed explanation of social development. Its future depends upon the prevalence of its own peculiar economic and social philosophy. Hence socialists the world over are naturally and deeply interested in education as a means of promoting their own cause. Most, if not all, socialist parties maintain a thoroughly organized system of propaganda, embracing not merely the dissemination of socialist literature, but also the promulgation of socialist ideas by a variety of forms of teaching. They maintain lecture bureaus, encourage the establishment of schools for teaching political and social science from the standpoint of socialism, and seek to promote in universities, colleges, and the common schools, an intelligent interest in socialism. In America socialists have organized an Intercollegiate Socialist Society with chapters in about fifty higher educational institutions. They maintain a Teachers' Bureau to facilitate the employment of socialist teachers; they organize socialist Sunday schools, and at every national convention of their party an exhaustive report on education is presented by a special committee on education. A similar interest and similar methods are manifested by the socialist parties in other countries.

Socialists maintain that the education of to-day is dominated by their enemies, namely, the capitalist class, and is used to promote the stability and perpetuate the interests of that class. They believe that the facts of history are colored, sometimes suppressed, for these purposes. Hence, as a matter of self-interest, and for the sake of what they believe to be the truth, they demand important changes in educational theory and practice.

There is another consideration quite as effective, perhaps, as the desire for party success in determining the attitude of socialism toward education. Socialism proceeds from the moral demand for equality of opportunity. Every child, it maintains, should have an equal opportunity with every other child for the full development of its physical, mental, and moral capacities. Under the operation of the capitalistic system, children of the poor may have no opportunities at all, or only such as are proportionate to the economic condition of their parents; or at best such advantages as are provided by free elementary schools. Socialism demands free, secular education for all, not only in the elementary schools, but also in the higher educational institutions. It favors compulsory education in the common schools, and the determination by proper tests of those who are fit for the higher education. It urges the necessity of vocational education in useful pursuits, but warns against the assumption that the value of its product is of

superior importance to the development of the child.

Socialism, then, both from self-interest and from the nature of its philosophy, is obliged to recognize the great importance of education and this recognition is manifested by the socialist parties of all countries. There is no national socialist convention without educational discussion, no socialist platform without its educational demands. The socialist party of the United States has incorporated in its most recent national platform a demand for "further measures for general education, particularly for vocational education in useful pursuits," and that the Bureau of Education be made a Department. SOCIETIES, EDUCATIONAL.—See EDUCATIONAL ASSOCIATIONS, TEACHERS' VOLUNTARY ASSOCIATIONS.

SOCIETIES, STUDENT—See STUDENT LIFE.

SOCIETY—See SOCIAL CONSCIOUSNESS SOCIOLOGY.

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE or **S P C K**—An organization established in England in 1609 by Thomas Bray (*q.v.*), and intimately connected with the development of English elementary education. The second and third resolutions discussed at the first meeting of the Society held on March 8, 1698-1699, were proposals to establish catechetical schools in each parish in and near London, and to provide for such education in a bill for employing the poor. On March 10 it was decided to "subscribe a stock for the insurance of the charge of setting up schools for promoting Christian knowledge." Money was soon obtained for the establishment of these "charity schools" (*q.v.*), as they were called. The society has always been connected with the Church of England and masters had to be members of that church. Reading, writing, and catechism were the subjects of instruction and the end in view was the elimination of vice and degradation then prevailing among the lower classes. Manual work was added to the curriculum at the Greycoat School, Westminster, in 1701, and in 1712 spinning, sewing, knitting, gardening, plowing, harrowing, navigation, and mathematics appear at different schools, while the Society took care to apprentice some of the boys. In 1703 it was proposed to establish a training school for

masters, but nothing was done at this time. From 1701 to 1877 an annual charity school service, attended by the charity school children in London at Christ Church, Newgate (1701-1781), and at St. Paul's Cathedral (1782-1877), was conducted. With the establishment of the National Society (*q.v.*), the S. P. C. K. surrendered to it the care of the schools, but continued for a long time to give assistance in religious education, and with the National Society opposed the establishment of any national nonsectarian scheme of education. The S. P. C. K. furnished Bibles, New Testaments, prayer books, etc., and in 1831 established school lending libraries. This led in 1831 to the establishment of a depository and the publication of books. In 1870 the S. P. C. K. granted £10,000 for building and enlarging church schools and made additional grants in 1874 and 1892. In 1871 the society gave £3000 to establish a system of diocesan inspection of religious education. From 1849 to 1877 the society generously assisted many Church of England training colleges and offered prizes to pupil teachers for religious knowledge. In 1877 the society founded its own training college, St. Katharine's College, Tottenham. To secure a supply of a native clergy the S. P. C. K. has contributed largely in all the British colonies to the funds of Church of England colleges and universities and theological schools. Among other activities now conducted under the society may be mentioned the following: the translation and publication of the Bible and prayer-book into foreign languages and selling them at cost or less, the production and circulation of religious books, tracts, and other works, and distributing such among reading rooms, missions, churches, seamen, sailors, etc.; the conduct of a home mission and of education in the support of Church of England day and Sunday schools; the conduct of foreign and colonial missions.

SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE. — An organization formed in 1825 as a result of Brougham's *Observations on the Education of the People*, for the purpose of publishing instructive books at a cheap price for the education of the people. With Lord Brougham (*q.v.*), one of the leaders in this Society was Matthew Davenport Hill (see under HILL, THOMAS WMORE). The introductory volume, by Brougham himself, appeared in 1827. In 1836 the Society included in its series *The Schoolmaster; Essays on*

Practical Education, containing works and extracts from leading educational writers and magazines.

SOCIETY FOR THE PROPAGATION OF THE GOSPEL IN FOREIGN PARTS.

— Founded by Royal Charter in 1701. Its general purpose was to act as an auxiliary to the Church of England in the English colonial possessions. More specifically its aims were (1) the revivifying of the churches already founded by supplying them with more adequately trained ministers, (2) the planting of churches in places where they had never been before or where they had fallen into decay, (3) the training of children in the tenets and worship of the church through the direct agency of schools. The organization of the society was patterned after that of the Society for Promoting Christian Knowledge which had been formed three years earlier for similar work in Great Britain and the colonies. After 1701 the S. P. C. K. confined its activity nearly altogether to Great Britain and left the distant field to the S. P. G. The membership of the S. P. G. numbered 300 during the eighteenth century and was composed of the prelates of the church and many of the clergy and representative communicants. Funds were acquired by means of subscriptions from the members, royal benefactions, collections in the churches at stated times, and gifts and bequests. From 1701 to 1780 the society expended approximately £350,000 on the work, fully two thirds of which represents the benefactions in the original thirteen American colonies. Missions were established in these colonies to the number of 340. The church, it was felt, was on a satisfactory footing in Virginia and Maryland and little work was carried on there. But all of the other colonies were benefited to some extent. Chief interest, however, was shown in New England, the middle colonies, and South Carolina. Of any single colony, New York received the greatest attention both in the number of missions and in the number of schools.

The society's support of schools in New York province began in 1704 and continued until 1782. From 1710 to 1770 between five and ten elementary schools were continuously maintained and more than fifty schoolmasters were given assistance. Such schools were chiefly located in the city of New York; on Staten Island; on Long Island at Hempstead, Jamaica, and Oyster Bay; in Westchester county at North Castle, Rye, and West Chester; in the upper province at Albany and Johnstown, and among the Mohawk Indians.

Instruction in church catechism was provided for the slaves in various parts of the province, and a catechetical school was carried on in New York City from 1704 until the Revolution.

The pupils in the elementary schools numbered from about twenty to as many as eighty-six. The usual enrollment was approximately forty. The society's support involved assurance from the schoolmasters that a specified number of pupils should be taught gratis. This policy was a guarantee of free tuition to some extent in all the schools. Accordingly nonpaying scholars were in the proportion of one fourth to one half of the enrollment. Except for about two years, the school in New York City was absolutely free during the entire century.

School support began in New Jersey in 1712 at Burlington, the society maintaining a school there until nearly 1740. Shrewsbury received similar assistance from about 1743 to 1763. Second River was assisted from about 1756 to 1777, Elizabethtown from 1748 to 1754, and a schoolmaster at Amwell was voted a gratuity in 1773. Bounties were allowed to schoolmasters in Chester, Pa., between 1712 and 1748, and in Lancaster between 1771 and 1778. Assistance was voted for the towns of Lewes and Oxford on a few occasions, this being either in money or books. A free grammar school was maintained at Philadelphia during most of the century. It was under the care of the S. P. G. agents and received some assistance from the Society, but the principal support was a royal bounty of £30 yearly. This grant was made as a result of representations from the society to the crown. Through frequent urging it was continued with a fair degree of regularity. From 1745 on, a catechist was supported at Philadelphia by the society for work among the slaves.

As early as 1707 two free schools seem to have been attempted at Boston in Massachusetts but could not have continued any length of time. Between 1720 and 1738 two of the town schoolmasters, who were of the church of England, were allowed an additional salary of £15 per annum by the society. In the years 1743-1745 inclusive a catechetical school was attempted at Boston. In 1766 and again in 1773 encouragement was given to a school in Salem. A greater amount of aid was given to Connecticut and Rhode Island. In the former colony the town of Fairfield was given assistance for a number of years following 1727 and 1738 respectively. A schoolmaster was supported at North Groton from 1745 to about 1761, and this was also true of Stratford from 1727 to 1752. In Rhode Island schools were partially maintained at Narragansett, 1723-1725 and 1726-1728, and at Providence from 1731 to 1778. At Newport, however, the grammar school was almost continuously assisted during the years 1721-1771.

Of the Southern colonies South Carolina received most of the society's attention. A schoolmaster was supported in Charleston as early as 1705 and until 1709. Between 1711 and 1731 the S. P. G. and the provincial government cooperated in carrying on this school, and a catechetical school for negroes was maintained between 1742 and 1761. Other assistance was allowed to schools in South Carolina as follows: St. Andrew's parish, 1744, St. Dennis's parish, 1721-1730; St. Paul's parish, 1726-1728; St. Thomas's parish, 1743-1763; St. James's parish, Goosecreek, 1709 and 1711-1717; Cuffetown, 1771-1774, and Winyaw, 1730. The irregularity of the support in this colony was due to frequent endowment of free schools by citizens and to the policy of provincial encouragement. The society encouraged a school in Newbern, North Carolina, from 1764 to 1771, and in Augusta and Savannah, Georgia, at various times during the period 1750-1775.

The society required schoolmasters to send semiannual reports which were to be certified to by the Church of England minister and some of the principal inhabitants. On the whole the regulation was not lived up to and consequently reports hardly averaged one per year. The most frequent and the most complete were those sent by the New York schoolmasters. Children were to be taught "to read truly and distinctly," "to write a plain and legible hand in order to the fitting them for useful Employments; with as much Arithmetick as shall be necessary to the same Purpose." Strict piety pervaded the curriculum. The end of education was, above all, to make the children moral and religious beings. Schoolmasters were required to teach them to read "the Holy Scriptures and other pious and useful Books"; to instruct them thoroughly in the church catechism; to use morning and evening prayers in the schools and to teach the prayers and graces for use at home. It was further required that schoolmasters oblige their scholars to attend regularly upon the services of the church and take special care of their manners, both in and out of school.

The scarcity of books was such that schoolmasters availed themselves of any they could procure. Various beginning texts were used for reading. These were hornbooks, ABC books, primers, and spelling books. When moderate proficiency had been attained pupils began to read such books as the following: Church Catechism, Lewis's *Exposition of the Church Catechism*, Psalter, Common Prayer Book, Testament, Bible, and *The Whole Duty of Man*. There were no other texts for reading than these. The society sent generous supplies of books for the use of the schools. It seems probable that a majority of the schoolbooks were from this source.

The schools of the S. P. G. represent an adaptation of the charity school work of the

S. P. C. K. to the educational needs of the church in the colonies. In such cities as Providence, New York, Philadelphia, and Charleston the ventures were probably as thoroughgoing as were the schools in England. Elsewhere the work was only partially representative. In view of the unusual obstacles that were involved, however, the movement represents a most praiseworthy effort. There can be no doubt that it formed the foremost philanthropic work in education during the colonial period. Except in New England, the S. P. C. K. schools furnished the nearest approach to a public school system that was to be found among the English colonists in the eighteenth century. W. W. K.

SOCIETY FOR THE SCIENTIFIC STUDY OF EDUCATION. — See NATIONAL HERBERT SOCIETY, TEACHERS' VOLUNTARY ASSOCIATIONS.

SOCIOLOGY. — Scope of the Subject — Sociology is the scientific study of society. Men, and many of the lower animals, live in groups. The scientific problem is to discover, by means of observation, induction, and verification, quantitative expressions for the regular ways in which group life operates, i.e. what, in quantitative terms, are the consequences of the fact that "man is a political animal." Study of this problem necessitates inquiry into the origin, composition, interrelationships and activities of groups. It includes consideration of the environmental, biological, and psychological factors which, historically, have conditioned the character of such groups as the process of evolution has produced. It requires investigation also of such differences and resemblances among groups as are of significance in explaining the

control which the group exercises over the individuals composing it. For quantitative expression the statistical method must be used. The ultimate aim of such study is to create a scientific basis for the conscious control of human society, to the end that evolution may be transformed into progress both for the race and for the individual. Unfortunately the scope of the subject has not been always thus conceived by teachers who label their courses Sociology. The latter half of the nineteenth century, the pioneer period in scientific sociology, witnessed a remarkable development of interest in the problems of philanthropy and penology. Inquiries into the causes of poverty and crime stimulated inquiry into the broader field of social causation in general, and the term sociology was used loosely to cover any portion of these fields. (See SOCIAL SCIENCES.) The term "applied sociology" for some time was equivalent to philanthropy and penology (*q.v.*). Recognition of the fact, however, that a theory of sociology can be "applied" in the guidance of public policy in every department of social life has initiated a movement, in America especially, to segregate the special problems of philanthropy and penology under the term social economy. This movement has not worked itself out fully, and there are still many courses given as sociology that should be called social economy. Sociology, in the scientific sense, of necessity uses the materials of history, and the demonstration or the concrete illustration of sociological principles has led naturally to systematic treatment of the historical evolution of society. It has been customary, therefore, to include, as a legitimate part of the scientific study of society, the history of social institutions. Beyond these limits there is a more or less indefinite zone of subjects such as social ethics, civics, social legislation, or even certain special questions in political economy and philosophy that have been included under the term sociology. The popular tendency, however, to make the term cover discussion of any social question whatsoever is gradually disappearing.

The present status of sociology as a science has been a direct result of the history of the subject itself. No one has yet done for sociology what Marshall did for economics. None of the textbooks is entirely satisfactory nor has entire agreement yet been reached as to the subjects which should receive most attention in a fundamental course. Nearly all the pioneers in sociology, with the exception of the very earliest, still retain leadership both in the science itself and in university chairs. Though all such leaders agree on fundamental points, each has naturally emphasized in his teaching that phase of the subject to which he has contributed most. At the present time, however, both the leaders and the large body of younger teachers who have been trained by them are beginning to place somewhat the same relative

emphasis on the various factors that have been found useful in explaining the problems of the science. Nevertheless, even now the teacher is compelled to organize his own courses to a considerable extent on the basis of his own reading and such special training as he may be fortunate enough to have had. The particular form which that organization takes in any given instance is usually dependent to a considerable degree upon the university at which the teacher has studied and upon the sources with which he has become familiar. The conditions which have made this situation inevitable can be appreciated only by understanding the history of the subject itself and thus realizing both the richness of the field and the freedom in choice of material which is open to the teacher.

History of the Subject. — The beginning of sociology, in the study of society itself, must have commenced far earlier than historical records permit proof of the fact; for the propensity of individuals to take thought as to how a group of men may be controlled can hardly be considered a recently acquired trait. Primitive man early developed systematic methods for teaching youth the means whereby both nature and man could apparently be controlled, and the teaching of that part of primitive magic which pertained to social control must have constituted one of the first courses in sociology. Problems of warfare, leadership, and group dominion must have also led both to practical knowledge of the nature of group activity and to the transmission of that knowledge from generation to generation.

Of necessity the statesman has ever been a sociologist. Likewise the philosopher has always busied himself with the relation of man to his fellow man. When Plato wrote the *Republic* and Aristotle the *Politics* the philosophical study of the subject was well advanced. A considerable part of the education of a Grecian youth was thus definitely in the field now called sociology. Later, when the evolution of world-empires led to the study of how great bodies of heterogeneous groups might be maintained in a single organized and harmoniously working system, men began to construct theories of group action, e.g. those of sovereignty and of the contractual nature of the state. Machiavelli, Bodin, Hobbes, Locke, and Rousseau each added elements to the growing body of social theory and helped to render the theory of group action more precise. Finally, in the nineteenth century, when the bounds of knowledge had become world-wide, when the development of the natural sciences had demonstrated the utility of exact scientific method and when the rise of modern nations, the growth of the industrial system, the ideals of democratic government, and the theory of evolution had begun to influence men, Comte and Spencer led the way in the construction of a comprehensive

theory of society, utilizing scientific method to elucidate modern problems of social evolution and of social progress. August Comte (q.v.) first used the word sociology in the *Cours de Philosophie positive*, and it was he who first insisted upon the use of the positive method in the development of the subject. It was Herbert Spencer, however, who in *Social Statics*, in the various volumes of the *Synthetic Philosophy*, and in *The Study of Sociology* attempted by wide observation to demonstrate that universal laws operate in human society. The work of many other men ought, however, to be included in a fuller statement of the important contributors to the development of scientific sociology in the latter half of the nineteenth century. To the influence of Charles Darwin and his kinsman Francis Galton, for example, must chiefly be credited that intensification of interest in the part which biological influences play in society which has resulted in the so-called eugenic school. (See *Eugenics*.) In the comparative study of institutions the pioneer work of Sir H. S. Maine cannot be forgotten, nor in the philological method of tracing social relationships, that of the Gumm brothers. In anthropo-geography and ethnology, moreover, there were such men as Ratzel, Robertson-Smith, McLennan, Morgan, and many others. Without the work of these men and their followers sociology must have rested upon a far more speculative foundation than is now the case.

Concerning the chief writers who have followed these leaders and who have contributed more particularly to sociological theory in the narrower sense of the term, it must suffice merely to mention names and to indicate the portion of the field in which each has done his chief work. Of such writers Durkheim has particularly emphasized division of labor as the essential factor in the explanation of society; Tarde, imitation; Le Bon, the impression of the mass on the individual; Gumplovicz, the struggle of races; Ratzel, the motivating power of interests; De Greef, social contact and social contract; Simmel, the forms of society and the process of socialization; Ward, the importance of human intelligence and inventiveness; Sumner, the unconscious processes in the evolution of institutions; Giddings, sympathy and likeness as subjective causes of the origin and maintenance of groups, the tendency to type formation, and the identification of type form with that of the group; Small, the interests to which men react and the methods of the subject, Ross, social control; and Cooley, social organization.

The competent teacher of sociology to-day utilizes the work of all of these men and that of many others who have elucidated less striking phases of the subject. If, perchance, he be capable of contributing to the science, he may be aiding in the recently inaugurated

effort to place the entire subject on a quantitative basis.

The Teaching of Sociology — The organized teaching of sociology as a university subject began long after the questions with which it deals had gained a firm hold upon the public mind. Little by little teachers of other political or social sciences which had already attained a recognized place in the educational system began to introduce sociological material into their courses and sometimes without sufficient justification to call the result sociology. Popular courses of lectures under the authority of recognized institutions of learning and dealing with almost every conceivable social question sprang up in nearly every civilized land and were called sociology. It was on this inclusive basis that in 1886 a report was made to the American Social Science Association that practically all of some hundred or more universities and colleges in the United States gave instruction in some branch of social science. A similar report could doubtless have been made for every country in Europe.

The first teaching of scientific sociology as a regular part of a college curriculum appears to have been in the United States when Professor Sumner in 1873 introduced Spencer's *Study of Sociology* as a textbook at Yale. In 1880 the Trustees of Columbia College established the School of Political Science in that institution, and in it Professor Mayo-Smith received the chair of adjunct professor of political economy and social science. The first department of social science was created at Chicago University in 1891. In the same year the first chair of sociology definitely so called was created in Columbia, and was held then, as now, by Professor Giddings.

The entire decade in which these last mentioned events occurred, however, showed a marked increase of interest, by educators, in sociology. By 1895 the University of Chicago announced numerous courses in the subject and at least twenty-five other colleges and universities in the United States were teaching sociology proper. As many more had made provision for instruction in charities and correction. In Belgium the Université Nouvelle de Bruxelles, established in 1894, with the eminent sociologist Guillaume de Greef as its first Rector, was itself launched largely because of a revolt against the conservatism of other universities with respect to the social sciences. De Greef's work is now largely supplemented by that of Professor Waxweiler and his staff of the Institut Solvay in the same city. Instruction is both in scientific sociology and social economy. In Switzerland as late as 1900 the only instruction in the subject consisted of a course by Professor Wuarin, the economist, given at Geneva, and one by Dr. Ludwig Stein, Professor of Philosophy at Bern. Italy has produced a number of sociologists of eminence, e.g. Lom-

broso, Ferri, Sighele, Ferriero, and Segni, but even in 1900 not one of them was teaching in a university. In that year also there did not exist a single chair of sociology, so called, in Germany. Throughout the preceding six academic years, however, or during one or more of them, courses in sociology were given by Simmel (Berlin), Sombart (Breslau), Bernheim (Greifswald), Sherrer (Heidelberg), Tonnies (Kiel), and Baith (Leipzig). Schaffle of Stuttgart had also become known as the chief representative of the "organic" school. France, the land of the early physiocrats in economics and the home of Comte, was almost the last to organize instruction in the social sciences. During the first three quarters of the nineteenth century no other social sciences were taught in France than the strictly juridical and moral. At the beginning of the last quarter, however, a place for political economy was made in the examination for the bachelor's degree in law. Even in 1900, according to Professor Gide, sociology was not taught anywhere in France in the form of a regular course, but three professors of philosophy and one of law were delivering free lectures on the subject, Durkheim at Bordeaux, Bouglé at Montpellier, Bertrand at Lyon, and Maurion at Toulouse. Letourneau, however, had by this time achieved a reputation in Paris. The privately supported *Collège Libre des Sciences Sociales*, had been found in 1892, but the courses included in its somewhat glittering program consisted of but ten lectures each, and were not well attended. Nevertheless, the most celebrated of French sociologists, Gabriel Tarde, first delivered at that institution in 1897 the lectures that subsequently appeared as his *Lois Sociales*. The school was later organized as the *École des Hautes Études Sociales*. At the *Collège de France*, also, certain courses in sociology were given after 1895, *honoris causa*.

In Austria Gumplowicz and Ratzschhofer have been the most noted names. The former taught at Graz. Russia contributed Lilienfeld and Novicow, but did not establish chairs for them. In Great Britain there was no chair or lectureship in the subject in any university prior to 1901 in spite of the fact that the Sociological Society was already in existence. The first important systematic series of lectures on sociology in the University of London was given in that year. Prior to that, however, Professor Geddes had been lecturing in Glasgow, and at the London School of Economics the sociological movement had received encouragement.

Such were the beginnings of systematic instruction in sociology. It is not practicable here to follow in detail the later development of the movement in all countries. The United States has introduced the subject in institutions of learning more rapidly than has been the case elsewhere. Nevertheless there has

been advance in all countries. The present status of the subject in educational institutions in the United States is well reflected by the report of December, 1910, upon the questionnaire issued by the committee on the teaching of sociology of the American Sociological Society. The questionnaire was sent to 300 institutions, of which over 366 were known to give courses in sociology. One hundred and forty-five replies were received. One hundred and twenty-eight institutions reported one or more courses in sociology. In addition to universities and colleges, five theological and twelve normal schools answered the questionnaire. In an effort to gauge the character of subject matter chiefly emphasized in the 128 institutions the number of times various types of subject matter were specifically mentioned in the replies was tabulated and resulted in the following classification and marks: historical subject matter, 84; psychological, 80; practical, 56; economic, 22; descriptive and analytic, 21; biological, 16. In addition, definite reference to "sociological theory" occurred 40 times and to "social pathology" 13 times. Under the first subject was included specific mention of anthropology, ethnology, institutions, and social evolution; under the second, social psychology, association, and imitation; under the third, congestion, housing, philanthropy, criminology, and "social problems"; under the fourth, industrial and labor conditions and socialism; under the fifth, physical influences and the study of a specific social group; under the sixth, eugenics and statistical treatment of population. These figures and classes do not imply exclusive or preponderating attention to any one of the classes of subjects mentioned, but merely indicate roughly the type of sociological subject matter which is primarily emphasized in the educational institutions of the country at large. Eighty-six specific suggestions for subject matter to form a fundamental course distributed emphasis as follows: historical, 28; psychological, 25; practical, 16; biological, 7; descriptive and analytic, 7; economic, 3. The same report includes a statement of texts and authorities cited in five or more replies to the questionnaire.

From the foregoing it is possible to understand clearly why sociology has not as yet made its way into the high school. The subject is already beginning to find a place in the curricula of normal schools, however, and sooner or later it will make its way in a simple form either to supplement or eventually to precede elementary courses in economics, civics, and history. Logically, a discussion of the fundamental bases of social organization should precede any of the questions that assume the existence of a particular sort of social organization, and there is, in reality, no reason at all why the essential factors that cooperate to produce the activities of social

groups cannot be explained in such a way that a child may appreciate the simpler modes of their operation and thus be helped to understand later the complex relations of the social life of modern civilization.

Methods of Teaching Sociology.—The subject matter of sociology, as is evident from the preceding review, lends itself most conveniently to the lecture method of presentation—at least when it is taught as a university subject. This is preeminently true if the historical evolution of society is to be treated in an adequate fashion. No student can be required to do the reading necessary for independent judgment upon the disputed points which often baffle the expert, nor would it be possible to discuss all phases of the subject in the brief time which the ordinary student can devote to sociology. The teacher may usually consider his work in this field fairly satisfactory if he succeeds in making clear the fact that the causes of social evolution can be subjected to scientific analysis as truly, if not as exactly, as any other phenomena whatsoever, if he is able to explain how the combination of various factors—physical environment, race, dynamic personality, economic, religious, and other cultural institutions—created the various types of society that have existed from the earliest forms of tribal organization to the modern world society, if he indicates the sources of information and their trustworthiness, and if in the presentation of these subjects he develops in the student a realization of the historical perspective from which it is necessary to view mankind's development whenever rational criticism of public policy is required.
